"Let the Eastern telephone people pass around the subscription list for stock to the actual users of telephones—the bankers, the lawyers, the merchants, the doctors, the butchers, the bakers and candlestick makers. Our rates at Fort Wayne are about 40 per cent. less than Bell rates. We have paid a dividend on our securities every three months. We have over 2,000 subscribers on our lines (all paying). In less than five years from time of organizing, and we are adding from 25 to 40 'phones per month."

Reports from elsewhere in the West indicate that this cooperative plan has been effective wherever tried. President Eckert, of the Knickerbocker Company, says many of the independent plants in the West are 10 years ahead of anything the Bell Company has.

Representatives of the Dauphin County, Pa., Telephone Company lately placed in the hands of City Clerk Miller their agreement to the ordinance as passed by the city councils some time ago giving to the corporation permission to erect poles, string wires and operate a telephone line in Harrisburg. The company agrees to have a line in operation within the time limits prescribed by the ordinance. Work will be started, it is asserted, as soon as the weather is settled enough to permit and the preliminary arrangements can be made.

The concern known as the Telephone, Telegraph & Cable Company, which owned an interest in the National Telephone & Telegraph Company, operating exchanges in 700 towns in Northern Indiana, Southern Michigan and Northwestern Ohio, has sold its interest to H. O. Paul and C. S. Bash of Fort Wayne, Ind. The Bell Company made an effort, it is said, to get the property, but failed. The stock owned by the New York company brought \$120,000.

At a largely attended mass meeting, held at Excelsior Minn., a short time ago, a proposition was submitted by the Twin City Telephone Company to put in operation a telephone exchange and make a belt line around the lower lake. The rate made for business houses is \$2 per month; for residences \$1.50 per month; for telephones at farm houses a rate of \$15 per year.

The stockholders of the Delaware County, Pa., Telephone & Telegraph Company last week decided on a sale of the property and franchise of the company to the United Telephone & Telegraph Company, the plant to be turned over on April 1. The Delaware County Telephone & Telegraph Company was organized in opposition to the Bell Company two years ago, and has been successful. The capital stock is \$75,000, practically all paid in.

At Winthrop, Minn., the People's Telephone Company has been organized by business men, and seventy 'phones will be installed at once. The officers are: President, R. R. Stoper; vice-president, C. M. Peterson; secretary, J. A. Larson; treasurer, C. A. Benson. The capital stock is \$10,000.

The Gainesboro Telephone Company has purchased from Overall Brothers & Parker, what is known as the De Kalb County line, extending from Smithville to Alexandria, Tenn., and including the exchange at the former place. The consideration was \$2,000.

A report from Seattle, Wash., states that J. S. McGroarty, the promoter of the Independent Telephone Company, who has returned from the East, announces that all arrangements have been made for the speedy completion of the system.

The Hopkins County Telephone Company was recently organized in Cumby, Tex., with a capital stock of \$1,000. The company will string lines over the county, and also establish an exchange at Cumby.

The Juvinat Telephone Company has been cutting the Sunset Company out of a great deal of patronage in Duarte and Monrovia, Cal., and the larger concern is about to begin a vigorous war on the lesser company.

M. C. Broin and Guy Hoffman, of Ohio, have organized a company with \$200,000 capital, and completed arrangements for the construction of an underground telephone system in Tampa, Fla. Work will begin shortly.

Fresno, Cal., has commenced to put all telephone wires underground.

Indiana and Independent Telephone Companies.

Indiana claims to have more telephone companies within its borders than any other State, and to be the home of independent telephony. The latter claim is contested by several other States, and the fact is that the Bell Company never had a monopoly of the telephone business, there having been a few independent telephone companies in existence since 1878, when the first telephone exchange in the world was opened in Connecticut by Morris F. Tyler. But Indiana's first claim is apparently borne out by the report of the State Board of Tax Commissioners for the year 1900, and will have to stand until reports come from Ohio and Iowa.

This tax report shows a total of 90 telephone companies in Indiana. Of these 90 companies, 84 are independent and 6 are Bell organizations. The total assessed valuation of all of the 90 properties, exclusive of real estate, office furniture, horses and wagons, etc., which are subject to local taxation, all of said property being assessed at its true cash value, is reported to be \$2,929,190. Of this amount, \$2,128,598, or 72 per cent. of the total assessed valuation, is assessed against the properties of the 6 Bell licensees, while \$800,592 or 28 per cent., is assessed against the 84 independent telephone companies.

Of these 84 independents, one set of 8 companies, or 10 per cent. of the 84, have an assessed valuation of \$462,166, or 57 per cent. of the total assessed value of all the 84 independent properties; while another set of 8 independent companies has a total assessed valuation of only \$1,730, or \$218 each; while a third set of 8 companies has a total assessed valuation of only \$5,578, or \$735 each.

Letters patent have been granted incorporating the Florida Telegraph & Telephone Association with headquarters at Inverness. The capital stock is \$5,000, which may be increased to \$250,000. The association will construct, maintain and operate telegraph and telephone lines, offices, exchanges and instruments, connecting with other telegraph and telephone lines, and deal in real and personal property. Among the incorporators are William K. Jackson, president; James F. Wilson, vice-president, and J. M. Young, secretary and treasurer.

Articles of incorporation have been filed for a telephone company to be known as the Mandan, N. D., & Northwestern Electrical Company. The capital stock of the company is \$25,000, and the incorporators are: C. E. V. Draper, C. M. Whitmar and C. F. Miller. The company intends to build a telephone line from Mandan to Oliver County and before a great while will extend up through Mercer County and around to Hebron. This line would cover a large territory and require considerable time to complete it.

There is a marked activity in the independent telephone field throughout Texas, and it is evident that the recent decision in the Berliner case has given capitalists confidence in independent telephone enterprises. It will not be long until Texas will be well covered by independent lines, and independent exchanges will be established in all the principal towns and cities.

Within the past fortnight, rumors of startling developments in the telephone-telegraph world have been urged with uncommon persistence. Briefly, it is alleged that there is in order a programme whereby the Postal Telegraph Company will cast its interests with those of the American Telephone & Telegraph Company (the Bell), and arrange some sort of a working alliance.

The Rural Telephone Company of Waterloo, Mich., is seeking to extend its lines so as to connect up with Jackson, Howell and Ann Arbor in that State. Mason is in the circuit, so if the plans are completed the county seats of Jackson, Livingston, Washtenaw and Ingham will be included.

The National Telephone Company of Wheeling, W. Va., is now having installed in its exchange building the lightning arrester and cross-connecting board, a device patented by the Stromberg-Carlson Company and said to be the most perfect of its class.

From Springfield, O., comes the report that the National Electro-Magneto Telegraph Company has succeeded in organizing a construction company, with a capital stock of \$1,000,000. The invention is a method of telegraphing without batteries, the instrument itself generating its own electricity.

The Twin City Telephone Company has secured permission from the St. Paul, Minn., city council to establish its service at fire headquarters. The instruments will be placed in the fire alarm office, and, if satisfactory, the service will be extended to other offices in the department.

American Telephone & Telegraph Company.

The American Telephone & Telegraph Company reports for the year ended December 31:

Earnings—1900, \$9,534,499; 1899, \$7,687,381; increase, \$1,847,118. Expenses—1900, \$4,048,441; 1899, \$3,416,873; increase, \$631,568. Net revenue, 1900 \$5,486,058; 1899, \$4,270,509; increase, \$1,215,549.

Of the surplus \$937,258 was carried to reserves and \$470,199 was carried to surplus.

The balance sheet as of December 31, shows: Assets—total, \$122,234,983. Liabilities—total, \$122,234,983. Of the bills and accounts payable, \$1,322,277 is for the dividends payable January 15, 1901, to stockholders of record December 31, 1900.

The retiring directors were elected at the annual meeting of the stockholders last week.

Extensive improvements and extensions are in contemplation for the operating telephone companies, of which the Federal Telephone Company is the parent financing corporation. Bonds for \$3,000,000 of the Cuyahoga Telephone Company, the local operating company, are to be sold and the money used for the completion of the plant in Cleveland, O., and for extensions of the long-distance lines throughout the States. New exchanges and systems will be placed in Ohio towns. To secure these bonds from indiscriminate offers of former bonds of the company by individual holders the company makes a proposition that the holders sell them to an underwriting syndicate at 85, which is regarded as a fair price. It is proposed to holders who do not care to sell in accordance with the proposition that they agree not to sell for less than 102 for a year from next July, without the consent of the deposit committee, which is to represent the underwriting syndicate.

The Austell, Ga., Telephone Company was granted a charter by the Superior Court a short time ago. The incorporators are A. H. Irwin, F. W. Runyon, W. B. Westmoreland, of Cobb County, and J. H. Lauch, B. H. Veal and R. B. Claud, of Douglas County. An exchange will soon be placed in Austell and lines run from there to Atlanta, Marietta, Powder Springs, Lythia Springs and other places.

The Shenandoah County Telephone Company will erect a through telephone line from Woodstock to New Market, which will connect with through lines to Harrisonburg and Luray, Va.

A telephone line is being built from Mansfield to Pottsville via Naborton and Greening, La. It will tap the line running from Cushatta to Shreveport at Greening.

The Shellrock Telephone Company has been working the town of Rockford, Ia., and has decided to put in a telephone exchange.

The Progress Telephone & Telegraph Company of West Milton, O., has increased its capital stock from \$10,000 to \$30,000.

It is reported that a new telephone company, composed of American capitalists, will shortly be granted a charter for operating in the city of Mexico.

TELEPHONE INCORPORATIONS.

The People's Telephone Company, Jacobsburg, O. Capital stock, \$1,000.

The Citizens' Telephone Company, Middletown, O. Capital stock, \$10,000.

The Sugarcreek Township Farmers' Telephone Company, New Palestine, Ind.

The Hillsboro Telephone Company, Cleveland, O. Capital stock, \$30,000.

The Winnebago County Telephone Company, Rockford, Ill. Capital stock, \$5,000. Incorporators: Fred L. Tritle, Charles F. Tritle and H. S. Hicks.

The Wildwood Telephone Company, Markleville, Ind. Capital stock, \$500. Directors: John Biddle, Charles Biddle, Elisha Davis, Lewis Johnson and Charles Fort.

The Mountain Automatic Telephone Company, Sonora, Cal. Capital stock, \$50,000. Directors: W. O. Dowie, P. M. Keefe, M. S. Sanford, W. S. Griffith and J. P. O'Brien.

The Louisville Home Telephone Company, Louisville, Ky., to acquire by purchase or otherwise telephone and telegraph lines and plants in Louisville and to operate the same. Capital stock, \$1,000,000. Incorporators: Charles J. Doherty, John A. Armstrong, Ezekiel Rice, Ellis M. Coleman, all of Louisville, Ky., and Edward L. Barber, of Waukegan, O.

GENERAL ELECTRICAL NEWS.

Lighting.

Augusta, Ky.—Thornton F. Marshall died at his home in this city March 25. In his will he left the city \$35,000 or \$40,000 to build waterworks and an electric light plant.

Biddeford, Me.—G. F. Haley has purchased the electric light plant in this city and will make extensions.

Bloomer, Wis.—The voters of this village are to vote this month on the question of granting a franchise to an electric light company.

Boise City, Idaho.—Brennan & Davis, two capitalists of this city, have made a proposition to the people of Montpelier to put in electric light works. It is said the offer will be accepted.

Bonanza, Ore.—An electric light plant will soon be erected here. Articles of incorporation for a company with this object in view have been filed with the clerk of Klamath County and is to be known as the Summit Irrigation & Power Company. The incorporators are A. D. and R. A. Harpold and R. S. Goodrich.

Butler, Mo.—At the election this month the question of issuing \$20,000 in bonds will be voted upon for the purpose of erecting an electric light plant.

Dunkirk, O.—A bond proposition for an electric light plant is about to be submitted to the voters of this place.

Dunn, N. C.—The Legislature has passed the bill authorizing the issuance of \$35,000 of bonds for an electric light plant, etc.

Excelsior, Minn.—A. Thiss and others of Minneapolis have submitted a proposition to put in an electric lighting plant, asking that they be granted a franchise for 20 years.

Gastonia, N. C.—This city will hold an election May 6 to decide the issuance of \$25,000 of bonds for waterworks and electric light plant.

Laurel, Md.—An electric light plant is to be erected here.

Madisonville, O.—The proposition to issue bonds to the amount of \$25,000 for the improvement of the waterworks and electric light plant is to be submitted to a vote at the coming election.

Media, Pa.—The borough council has passed a resolution to build its own electric light plant.

Newton, Falls, O.—The citizens of this place intend to have electric lights.

Norman, Okla.—The citizens are talking of putting in an electric light plant.

Oquawka, Ill.—The Grand Opera House of this city is to be fitted out with an electric light plant.

Pendleton, Ind.—The town board is considering the advisability of putting in an electric light plant. W. H. Aiman of this place has asked for the franchise.

Richmond, Ind.—The effort of a number of taxpayers to prevent the construction of a municipal electric light plant recently ended in failure. An injunction suit was brought, but the court ruled against it. The city will put \$150,000 into the plant.

Richmond, Va.—W. P. Knowles, superintendent of the City Gas Works, Room 9, City Hall, will receive bids until May 1 for furnishing this city for one year with 500 electric arc lights of 1,200 candle power per light for street lighting.

Ripon, Wis.—W. H. Wheeler, of Beloit, will soon ask the Ripon council for a franchise to construct and operate an electric light plant, etc.

Sabetha, Kan.—At a recent election it was voted to issue \$10,000 in bonds for an electric light plant.

Stark, Fla.—On April 16 the citizens of this place will vote on the question of bonding for electric lights and a water plant.

Syracuse, N. Y.—This city is considering the advisability of municipal ownership of the public lighting plants.

Tipton, Ind.—The citizens have voted to erect an electric light plant next fall.

Weiser, Idaho.—At the election this month the people will vote bonds in the sum of \$60,000 for the purpose of installing an electric lighting, water and sewage system.

West Plains, Mo.—The citizens of this place are planning to erect an electric light plant. Address Councilman Hunt.

Westerly, R. I.—Westerly is to ask permission of the Legislature to establish a gas and electric plant to be owned by the town.

Wenatche, Wash.—This place is about to order an electric light plant.

Wolcott, N. Y.—Arrangements are being made to add \$7,000 worth of electrical apparatus to the electric light plant here.

Woodbury, N. J.—An electric light plant is to be erected here.

Woodbine, Ia.—At a recent council meeting it was decided to build an electric light plant.

Yorktown, Tex.—A new \$8,000 electric light plant will soon be erected here.

Street Railways.

Benton Harbor, Mich.—The Michigan & West Shore Traction Company has been granted a franchise by the city council to construct an electric railway in this city.

Boulder, Col.—The prospects for a consolidation of capital from several of the large mining companies in the Ward district for the construction of an electric narrow gauge line up Left Hand Creek are encouraging, and with the increased output of the mines there is no question but that it will ultimately be built.

Canastota, N. Y.—At a meeting of the general committee on the proposed Canastota and Morrisville trolley road the capital stock was placed at \$200,000, and \$70,000 must be raised by subscription before a company can be organized.

Cleveland, O.—Hon. M. Dodge is the promoter of a new electric railway from this city to Warren.—It is reported that the Adams Express Company is behind the Everett syndicate in the proposed consolidation of electric lines to make a continuous one between here and Detroit.

Delavan, Wis.—It is said that an electric road will be built from Beloit to Delavan Lake, which will connect with the Walworth electric road, which is to be extended to Mettowee, there to be connected with the proposed line.

Dover, N. H.—Among the electric railway charters granted by the New Hampshire Legislature are two for the formation of a complete trolley line connecting this city, Somersworth and Rochester, all situated on the eastern border of the State, with the State capital. These charters were obtained by a syndicate of Boston and New Hampshire capitalists, the head of which is Wallace D. Lovell, of Boston.

Doylestown, Pa.—The mail between Willow Grove and here is now carried by trolley.

Eldora, Mich.—The question of an electric line from Waterloo to Des Moines by way of this city and Nevada is again being considered.

Harpwell, Me.—An electric railway to this place is now being talked of.

Lawrence, Kan.—L. M. Erb has been granted a franchise to construct an electric street railway in this city.

Louisville, Ky.—The Louisville, Mt. Washington & Fairfield Electric Railway plans now have every appearance of being an early assured fact. Mr. Roland Cox, of Spencer County, is largely interested in the venture financially.

Niagara Falls, N. Y.—The Ridge Road Trolley Company has increased its capital from \$1,500,000 to \$3,000,000.

Olcott, N. Y.—The villages of Olcott and Wilson are to be united by a trolley line, probably this summer.

Rushville, Ind.—The county commissioners have granted the right of way through Arlington to the Indianapolis, Morristown & Rushville Traction Company. Work will begin on the line this spring.

Thompsonville, Conn.—A scheme has been on foot for the purchase by a syndicate not only of the Enfield & Longmeadow Electric Road, but of other roads that

would complete a continuous through line from Boston to New York. Promoters of the scheme have visited Thompsonville to look over the road and negotiations are now pending.

Toledo, O.—The Urbana, Bellefontaine & Northern Electric Railroad of Springfield was incorporated for \$50,000 to build and operate an electric road between Urbana and this city.

Van Etten, N. Y.—There is talk of building a trolley line from Horseheads to this place the coming summer.

Manufacturing.

Cincinnati, O.—The annual meeting of the Bullock Electric Manufacturing Company was held recently, and there was no change in the board or officers. The report of President George Bullock showed that there had been booked so far during the year 1901 over \$250,000 in orders.

New York City.—The Graham Brothers' Company of this city has been organized to manufacture electrical machinery on a capital of \$25,000. J. A. Graham, J. H. Graham and J. T. Booth are those interested.

Syracuse, N. Y.—The Onondaga Dynamo Company is obliged to have its men work night and day. It has been found necessary because of increased business to install a large amount of new machinery.

Company Matters.

Detroit, Mich.—Ransom E. Olds, manager of the Olds Motor Works, which was destroyed by fire several weeks ago, says that the business has so increased it will be necessary to make a large extension of the plant when they rebuild.

New York City.—Last week fire started in the upper floor of Nos. 440 and 444 Canal street, occupied by J. H. Bunnell & Co., dealers in electrical supplies. The two top floors were gutted.

Power and Transmission.

Charlotte, N. C.—Dr. Robert Wiley, of New York, is interested in the Catawba River Power Company. The company, he says, is at present discussing transmitting the power to this city.

Denver, Col.—The ordinance calling a special election May 16, to vote upon the granting of a franchise to the Pike's Power Company, was passed by the council a short time ago on second reading. The franchise gives the company the use of the streets for the transmission of light, heat and power.

Tacoma, Wash.—The plans for the development of the immense water power at Nisqually Falls, to furnish power for Tacoma manufacturing plants and those of other cities in this vicinity, are progressing well.

Automobiles.

Elizabeth, N. J.—The American Traction Company has been incorporated here with a capital stock of \$250,000. The company is to do a carrying trade, using automobiles. Herbert Knight of Newark and Daniel J. Newland and Frederick A. Raymond of New York City are all interested in the concern.

New Haven, Conn.—Col. R. S. Woodruff, of the C. S. Mersick Company, is in Chicago, endeavoring to close negotiations with the Woods Motor Cycle Company of that place, which may end in the removal of one of the firm's plants to this city.

Ogdensburg, N. Y.—Considerable interest has been aroused among the working people of this city over the possibility of a factory being established here by the Auto-Truck Company.

Providence, R. I.—The Baldwin Motor Wagon Company of this city is seeking a favorable town or city for the location of its plant.

Toledo, O.—W. L. Githens, of New York City, one of the leading men in the bicycle and automobile trust, was lately in this city, and stated that the automobile business of the trust would likely be centered here. The bicycle trust manufactures electric, steam and gasoline wagons.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by ELECTRICITY from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16½@16¾c.; Lake, 16½@17c.; casting, 16½@16¾c.

The New York Stock Exchange will be closed on Friday and Saturday.

The New Orleans Lighting Company, capital \$2,000,000, was incorporated at Trenton, N. J., on Saturday.

Dividend disbursements of industrial corporations for April 1 are computed at \$21,629,600 as compared with \$26,166,430 for March.

Henry D. Moore, of Philadelphia, has purchased the large electric light plant at Ocean City, N. J., from the Ocean City Association.

Philadelphia Union Traction earnings for the first eighteen days of March, it is said, were about \$23,000 ahead of the corresponding period last year.

The New York and New Jersey Telephone Company has declared the regular quarterly dividend of 1½ per cent, payable April 15 to stock of record April 5.

It is estimated by a financial authority that \$24,000,000 will be paid out in dividends this month, making total for four months of the current year about \$50,000,000.

A syndicate of Cleveland banks and trust companies has been formed to underwrite the securities of the Aurora, Wheaton & Chicago Electric road to the sum of \$3,000,000.

The regular quarterly dividend of 3 per cent. on North Chicago Street Railway, guaranteed by the Union Traction Company, is payable April 15. Books close on April 6.

The New England Telephone and Telegraph Company has declared a regular quarterly dividend of \$1.50, payable May 15 to stockholders of record April 25. Transfer Books close April 26 and open May 15.

A Chicago dispatch states that the management of the Illinois Electric Vehicle Transportation Company has received more than enough proxies from stockholders to carry through the plan to liquidate the concern.

Rumor has it that President Vreeland, of the Metropolitan, has in the last week been in frequent conference with Brooklyn Rapid Transit officials, and that Pennsylvania interests are also figuring in some way in these conferences.

The following are quotations for some of the industrial stocks not quoted elsewhere: Electrical Lead Reduction, 5@5½; Electric Boat, 24@26; Electric Vehicle, 14@16; Tel. & Tel. Company of America (full paid) 6@7; Electric Company of America, 8¼@8½.

At the annual meeting of the stockholders of the New York Electric Vehicle Transportation Company Monday the retiring board of directors was re-elected, with the exception of Robert McLloyd. His place was filled by G. Herbert Condict. The board of directors will meet in a few days and re-elect the present officers.

A special meeting of the stockholders of the New England Electric Vehicle Transportation Company has been called to be held in Jersey City, April 20 to act upon the recommendation of the directors that the company be dissolved. In a circular to stockholders, the directors state that the company has been running at a loss since it began business.

The United Electric Company of New Jersey on Saturday last gave a collateral mortgage to the New Jersey Title Guarantee Company, of Newark, for \$20,000,000. The mortgage bears 4 per cent. interest in gold and matures in fifty years. It is given to secure a new issue of bonds. The company gave a like mortgage last year. The mortgage was made to cover the cost of absorbing numerous electric plants throughout New Jersey.

The Bell Telephone Company of Toronto, Ont., has a bill before the Dominion Parliament asking for power to increase its capital stock to an amount not exceeding \$10,000,000, including the present authorized stock. This will make the third increase in capital stock since the company's inception. Incorporated in 1884 with a capital of half a million dollars, an advance to \$1,500,000, in addition to the original amount, was permitted in 1884. Eight years later, an increase to an amount not exceeding \$5,000,000, was sanctioned, and now a capital stock of ten millions is aimed at.

The transfer books of the Westinghouse Electric & Manufacturing Company will close April 9 and reopen April 20, to allow the stockholders to subscribe for one share of additional stock at \$55 in proportion to each five shares of existing stock. The present additional issue is \$3,000,000 of the \$10,000,000 authorized February 20. A syndicate has underwritten the entire amount. Subscriptions must be made by April 20, at the office of August Belmont & Co., and accompanied by payment of \$25 a share. The balance of \$30 a share is payable June 15, at which date the stock will be delivered. Transferable receipts will be given upon receipt of the first payment. The new stock will participate in all dividends after May 15.

Wilson & Stephens offer at 102½ and accrued interest \$1,000,000 New York and Queens Electric Light and Power Company (operating in the City of New York, Borough of Queens), 5 per cent. first consolidated mortgage gold bonds, due August 1, 1914, interest payable February and August; the Union Trust Company of New York, trustee. The total issue authorized is \$2,500,000 of which \$200,000 remains reserved in the treasury for future extensions; in hands of trustees to retire like amount of New York and Queens Electric Light and Power Company 5 per cent. bonds, \$391,000; outstanding in hands of public (being bonds exchanged to date for underlying bonds), \$560,000, leaving an issue of \$1,349,000 of which \$1,000,000 is now offered, the balance of \$349,000 having been privately disposed of. Details as to the capitalization and earnings of the company are attached to the banker's announcement.

EDITORIAL NOTES.

A Frenchman's Opinion of Edison and Tesla.

It is often-times amus-
ing to hear persons dis-
cuss on subjects of
which they know little
or nothing. A recent
cable dispatch from Paris to the N. Y. "World"
states that the representative of that paper
interviewed Eugene Schneider, head of the
Creusot Iron Works, the most important rail,
locomotive and gun factory in France, about
Thomas A. Edison's new claim that he has dis-
covered a process which will blast America's
steel supremacy. This process has created
considerable curiosity there and in England,
because if Mr. Edison could really separate
hematite from magnetite, converting the
former into Bessemer steel, enormous Euro-
pean ore deposits now unprofitable would yield
richly.

Mr. Schneider and his chief mining engineer
expressed themselves skeptically regarding the
new discovery. Mr. Schneider said:

"What is the use of discussing Edison's ad-
vertising dreams? He has no special knowl-
edge of metallurgy, and the problems he claims
to have solved have engrossed scientists all over
the world.

"Let Edison occasionally do what he claims
he can do and then we will be willing to give
him attention. But Edison's tactics, like
Tesla's, consist of finding what difficulty puzzles
scientists and announcing that their own
genius is about to solve it. But when the time
comes neither realizes his glowing promises.

"Let it be said once and for all that real
scientists all over the world consider Edison
and Tesla a pair of humbugs.

"What has Edison discovered except the
phonograph, which was a chance discovery and
not the result of scientific perspicacity. Not
electrical incandescence, for that was really
invented in Germany; nor the biograph, which
was discovered here by Lumiere, nor anything
of real importance.

"On the other hand has Tesla destroyed the
Spanish fleet, as promised, or telephoned across
the ocean, or lighted houses without wires, or
entered into communication with the planet
Mars?

"It is a perfect wonder that the American
public, with its quick sense of humor, has not
long ago shamed these two cheeky pretenders
into silence."

Assuming that the above is a correct report
of the interview, we think the head of the
Creusot Iron Works has committed a grievous
error in referring in the way he did to two
such men as Edison and Tesla.

That Edison is not a scientist every one will
agree, but on the other hand he has given to
the world invention after invention of untold
value, the Frenchman's statement to the con-
trary notwithstanding. He did more toward
perfecting incandescent electric lighting than
any other investigator, invented the phono-
graph and gave to the world the quadruplex
system of telegraphy, to say nothing of the
three-wire system, the low-resistance dynamo
and innumerable other devices which have
benefited the world to a greater or less extent.

As regards Nikola Tesla, the gentleman
quoted states that he is no scientist. In this
we beg to differ with him, for although it must
be acknowledged that Tesla has only given the
world one important invention he is such a
deep scientist and looks so far into the future
that he is a century before his time. In other
words, some of Tesla's ideas, which are con-
sidered by the general public as visionary
dreams, will be actual facts a hundred years
hence. When, therefore, a foreigner under-
takes to belittle in the language quoted above
two such well-known investigators and inven-
tors as Edison and Tesla, it may safely be at-
tributed to a feeling of envy on his part.

* * *

The Hutchinson Invention.

Important inventions
and discoveries may be
divided into two dis-
tinct classes, first where
they benefit mankind

in a commercial way, and second where they
tend to relieve suffering humanity. In the
latter category is to be found the Roentgen
ray and various electrical methods of treating
diseases as well as the device perfected by a
young electrician by the name of Hutchinson
for making the deaf hear. Mr. Hutchinson
has been working diligently on his invention
for several years now, one of the first experi-
ments having been made on deaf mutes in
Mobile, Ala., as far back as April, 1899. At
that time the wonderful results attained by
Mr. Hutchinson were referred to in these col-
umns. The inventor is now in this city where
he has given practical demonstrations of the
working of his apparatus before a distinguished
body of specialists, members of the New York
Academy of Medicine.

The instrument, by means of which striking results have been obtained, consists of two rubber ear pieces held together by means of a spring, much resembling in appearance the headgear made use of by central telephone exchange operators, and a metal breastplate on which is fixed, just in front of the mouth of the wearer, a transmitter apparently quite similar to the type found on many telephones. This transmitter, which is made of hard rubber, is so pivoted that it may be turned in any desired direction, or in other words, toward the source of any sound which it is desired to hear. The current for operating the system is derived from a number of battery cells, a switch located on the breastplate permitting the wearer to cut the apparatus in or out of circuit at will. Another switch is also provided for controlling the amount of current passing through the circuit, and consequently the intensity of the sound produced. The wiring and switches are furthermore so arranged that if it is found that one ear of the patient is more sensitive than the other, the volume of sound can be adjusted accordingly. From the above general description, it will be seen that Mr. Hutchinson's invention resembles in many respects the loud-speaking telephone.

From demonstrations that have recently taken place in this city it would seem as though the Hutchinson device, not only enables a deaf mute to hear, but so stimulates the aural nerves that a patient recovers, at least partially, his lost sense of hearing. The possibility of relieving the infirmity of the deaf mute is, therefore, the hope of the professional fraternity, and to that end, now that the way has been pointed out, their energies are to be directed. If success crowns their effort, one of the most unfortunate afflictions that the human race is heir to will have been alleviated.

* * *

What is Being Done in India in the Electrical Line.

In a recent edition of the N. Y. "Times" there appeared a very interesting article by the Simla correspondent of that paper on the use of electrical machinery in India. It seems that matters electrical have been neglected in that country until quite recently, in spite of the fact that water power abounds, and millions of horse power are running to waste. These streams are fed from the vast snow fields of the Himalaya range. Unfortunately for the inhabitants it is only possible to utilize the power of these waters at a convenient distance from the foot of the hills as all the towns are far out on the plains. The correspondent says: "In time, no doubt, we shall adopt the American principle of bringing the towns to the power, as in the case of Niagara and other places. But there are other rivers in India besides those flowing from the Himalaya which can be utilized for power purposes. There is now in course of execution a scheme for the utilization of the power running to waste in the River Cauvery, which would be deemed of merit in America itself. The Cauvery rises in the northern portion of the native territory of Mysore, and flows partly through Mysore and partly through British territory, to the Bay of Bengal. The falls on the river which it is now proposed to utilize are 320 feet in height, but for a mile above the actual falls the river runs in a series of rapids,

dropping a hundred feet in that short distance. The drainage area of the river above the falls is some 6,000 odd square miles. The maximum flood discharge is close on 250,000 cubic feet a second, the ordinary discharge during the rainy season is 180,000 cubic feet a second, and the lowest recorded discharge, during the extreme dry season is 95 feet.

"It has long been recognized that here was a source of power which it would be almost criminal not to utilize. But, unfortunately, there have hitherto been serious drawbacks to all schemes for the use of this power running to waste. The falls are situated in an out-of-the-way corner of the State, far from the railway, and the climate is so unhealthy that it was out of the question to establish factories close to the source of power. A couple of years by, however, a Royal Engineer officer, whose services had been lent to the Mysore State, conceived the idea of utilizing the power at the Cauvery Falls to run the Kolar gold fields, ninety miles away, in a direct line."

It is stated that this scheme was strongly backed by the Prime Minister of the native State, and was approved by Lord Curzon. The officer in question visited this country in order to see how similar installations were worked, and on his return to India planned a scheme, which is now in process of execution. It seems that the Kolar gold mines are a great distance from the coal fields, and their fuel bill is consequently very heavy. "Power, in fact," says the writer of the article, "costs them £30 per horse power per annum. It has been ascertained that electrical power can be transmitted to the gold fields from the Cauvery Falls at a much less figure than this, and a contract has been entered into with the mines to take 4,000 horse power at a rate per horse power per annum varying from £20 in the first year, £18 in the next three years, £14 in the fifth, and thereafter £10 per unit for a period of five years. The mines calculate to save more than £500,000 by this bargain during the next ten years.

"The Mysore State, on the other hand, estimates that for a capital outlay of something under £300,000, the cost of the installation, and after allowing for depreciation and wear and tear of plant, profits to the extent of £524,000 will have accrued at the end of the ten years' period for which the contract with the mines has been made. Thus both parties will benefit to the tune of upward of £500,000."

Most of the electrical machinery for the plant, so it is understood, has been obtained from the United States, there being, as the correspondent states, "no British firm competent to supply it," which should prove rather unpleasant news for British manufacturers.

MR. THOS. A. EDISON has been interviewed regarding his latest invention. He says: "My new storage battery will be about half the weight of those now used in automobiles. I do not use lead in the battery, but I do not care to state at present what metal is employed. The battery is permanent and does not suffer from depreciation. Of late I have been giving my attention almost exclusively to chemicals. I have discovered a new reaction in chemistry which is going to prove very valuable. The capital stock for my new storage battery has been subscribed by the presidents of three trunk lines. There is not a share of the stock on the market. I have perfect confidence in the practical success of my

new invention, and the first demonstration of the process will be made at the Pan-American Exposition. I will build a factory at Menlo Park for the manufacture of the batteries. I have made fortunes for many people out of my inventions. This one is going to make a fortune for Edison."

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

A MAMMOTH plant for the manufacture of insulated copper wire is to be built in Newark, N. J., it is said, at a cost of \$1,000,000, by a company of New York capitalists, some of whom are connected with the Steel Trust. A patent process for insulating the wire is to be used, in which, it is said, there is an immense saving over the present process. Several thousand hands will be employed.

It is reported that a rich deposit of copper has been discovered in Chautauqua County, N. Y., at a depth of 500 feet. Jamestown capital is interested and a shaft at a cost of \$57,000 will be put down.

BRITISH business men evidently believe that there is some good in combination in spite of their condemnation of trusts of the United States. It was officially announced, says the New York "Tribune," that the Thames Iron Works Shipbuilding and Engineering Company, Messrs. Siemens, Mather & Platt, and the Brush Electrical Engineering Company, are to close their ranks and to combine their forces in order to make a fight for British industry. One immediate consequence of the formation of this British trust is that designs have already been prepared for electrical equipment of two underground railway lines of London and the construction of another one.

A DISPATCH from Paris, France, announces that M. Naudon, a scientist, has found means of producing X-rays without electricity, by exposing a metal plate to the rays of a violet end of the spectrum.

J. PIERPONT MORGAN lately purchased the plant of the Liberty Electric Light & Power Company and has presented it to the Loomis Sanitarium for consumptives on Liberty Heights, two and a half miles from Liberty, N. Y. The price paid for the plant was about \$40,000.

FROM New York to Philadelphia for only 50 cents. This is the alluring promise which will be a reality before Christmas, according to Mr. A. L. Johnson, the trolley magnate, who says in his latest bulletin to the press: "I will have electric cars running through from New York to Philadelphia at the rate of 50 miles an hour before next Christmas. A regular schedule between Trenton and New York will be entered upon on July 1 next. The Philadelphia, Trenton and New York Railroad Company is about the last link in my through system. I have secured the line from the terminus of the Trenton, Lawrenceville and Princeton Railroad, already constructed to the New Jersey side of the Calhoun street bridge, across the Delaware River. To avoid any controversy over this important point I bought the bridge outright. New Yorkers will be able to travel to Phila-

delphia over our lines with great speed at a cost of only 50 cents, as against \$2.50, the present railroad fare.

THE Bay Counties Power Company is stringing 10-inch steel cables across Arm Bay, from Port Costa to Benecia, Cal. There are towers on either side 250 feet high and the cable will have a single span of 4,400 feet. They are the largest cables in the world carrying power, and also the longest unsupported span. They will carry a current of 20,000 volts, which will be delivered at Oakland shortly.

A DISPATCH from Washington dated April 3 states that Prof. Willis L. Moore, chief of the Weather Bureau, has returned from an inspection of the wireless telegraphy stations at Cape Henry, Va., and Hatteras, N. C. These stations are forty-seven miles apart, with no land between, and messages are being exchanged daily. Elaborate experiments will be conducted later in the season.

DR. JOSÉ MARIA BORGIA, former Consul General and Acting Minister to the United States from Ecuador, has been in this city some time and before leaving for home said: "I have been in this country making arrangements for the shipment of machinery for the better development of our gold fields. In a few months we will have more than 300 dredges there worked by electricity. We consider our gold fields, when fully operated, will prove the richest in the world."

Two of the large turbines were started last week at the power plant of the Trenton Falls, N. Y., Electric Light & Power Company. The test was simply to ascertain the quality of the work that has been done on the wheels, each of which weighs 22,000 pounds. The wheels ran smoothly and showed perfect balancing, proving that the construction was a successful piece of work. Each generator with its wheel will weigh 60,000 pounds, and each generator will produce 1,700 horse power of electrical energy. Everything worked to the best satisfaction of those who witnessed the trial.

THE committee on guide boards appointed by the Automobile Club of America has adopted the Bessemer steel sign post and work is being pushed forward so rapidly that it is expected the erection of the posts will be completed along the main highways early enough to facilitate the summer runs and tours.

THE Pierrefitte silver mine, which is situated in the French Pyrenees, about 14 miles from Pau, is now worked electrically. Water power is utilized for driving the generators. Mr. E. H. Davies, who acted as expert in connection with the equipment, has just described the electric power station before the Institution of Mining and Metallurgy in London. He told the following interesting story: In December last a strange accident happened to the 100 hp. motor. The motor man reported that when restarting after dinner a flash of fire enveloped the collector, whereupon he shut off the current. There was nothing visibly wrong with the machine, but the same thing recurred. Thereupon the motor was more closely examined, and finally the smashed remains of a rat were found inside the armature, where he had apparently taken refuge during the dinner hour, and his blood had

caused a short circuit across some of the collecting wires. This trifling incident led to the machinery being idle for a week for repairs.

A CABLE dispatch states that the first electric street car line within the limits of London began running on April 4.

THE annual report of the General Electric Company will probably be issued some time this week, as it has already been passed upon by the directors. It is understood that a circular will be issued, simultaneously with the report, in which the plan of the directors for the restoring of the old capitalization will be made public. Preferred stockholders will be given new stock in exchange for their holdings and all of the preferred stock will be retired.

A NEW branch of the electrical engineering course has been started at Armour Institute of Technology at Chicago. It is designed to fit students for work in telephone construction in a way that has never been attempted in a technological course in that city. L. P. Dickinson, an institute instructor, with practical experience in the work, will have charge of the course.

THE city of Pittsburg, Pa., has begun the taxing of all vehicles and the issue of licenses at the following rates: Six dollars for a single horse and wagon or a single-seated automobile, \$10 for a two horse wagon or a two-seated automobile, and \$12 for a four horse wagon or automobile, if more than two seats. Since March 1, fifty cents extra has been added to these rates.

It was stated recently that the final papers are being adjusted with a view to the construction of an electric traction system in Barbadoes, West Indies. New York parties are said to be approaching certain Canadian capitalists for the purpose of jointly building and operating the road, which will entail an expenditure of nearly \$500,000. The road will be the first electric one in that part of the world.

MR. K. YONEKRA has been in this country for some time inspecting the latest types of mining machinery and has already placed orders for a considerable quantity of American apparatus, which will be introduced in the coal mines of Japan. In speaking of the development of the coal mining industry in Japan, he stated that it had been delayed by the fact that the gas and fire-damp in the mines of Japan are much more common and deadly than here, and that mine catastrophes were of very frequent occurrence. He gave an instance by saying that there had been several explosions in the mines of his company during the past two months, one of which occurred on March 12 and caused the death of twelve men. The company is now engaged in placing electric lights throughout its mines and hopes in that manner to do away with the danger of explosions from miners' lamps.

CONSUL GENERAL GUENTHER, in a report to the State Department from Frankfort, says that, according to German press reports, the project involving the construction of an electric railway between Rome and Naples, which was agitated some time ago but afterward

abandoned, has been revived. Two Neapolitan engineers, it is stated, have prepared new plans for the road, which have been submitted to the ministry of public works. The contemplated railway will run along the shore via Cancelli, Mondragone, Minturno, Formia, Fondi, Terracina and Cisterna to Rome, with a branch line by way of Marone and Giugliano, to Capodimonte, the summer residence of the king. It will be double-tracked, with a total length of 135 miles.

A PITTSBURG dispatch says that representatives of the larger manufacturers of glass lamps and electric glass ware have agreed to enter a "combine" with a capital of \$5,000,000 or more, under a New Jersey charter. The companies interested sell upwards of \$6,000,000 worth of goods annually.

A RECENT issue of the "Engineer," London, states that M. Romanoff constructed at Gatschina, twenty miles from St. Petersburg, Russia, during the summer of 1900, a small electric railway on a system which he had invented, and the results were thoroughly satisfactory. He has now drawn up a project for constructing an electric railway from St. Petersburg to Moscow. It has long been well known that the existing Nicolas Railway, connecting the old and new capitals of Russia, and 404 miles in length, is unable to cope with the traffic. The authorities entertain the idea of separating the passenger traffic from the goods traffic, and for this purpose it is said that two other tracks are to be laid down. However, M. Romanoff has now come forward with a proposal to construct an electrical "hanging railway," at a cost of 98,000,000 roubles, which shall take the place of increasing the carrying capacity of the present line by the addition of two tracks.

OWING to the sporadic appearance of small-pox in a Michigan town recently the usual Sunday morning services of the churches were rendered by telephone. In the morning the local exchange made a circuit connecting as many of the subscribers who were church members as possible with their respective places of worship, and, at the appointed hour, singing, reading and 15-minute sermons were sent over the wires from the churches.

A CHEAP electric method of producing copper panels, friezes and other building decorations has now appeared. The design is first executed in plaster or wax. This model is then coated with a layer of copper by depositing it electrically. The thickness of the covering can be readily controlled. It may only have the thickness of paper, or it may be an eighth of an inch or more in thickness, according to the character of the service required of it. This process is very much cheaper than the usual one of casting. After the matrix is formed, as above, it can be put through the usual processes for finishing the surface in an artistic manner. Plaster models, such as those used in drawing schools, can be coated with a very thin layer of copper in this manner, when they will withstand a great deal of hard handling. Decorations and designs for outdoor service are especially durable when formed in this way, as the coating is practically impervious to the influence of the weather.

"Electricity's" Educational Series.

BY R. MAX EATON.

ARTICLE NO. 22.

THE TELEPHONE AND TELEPHONE PRACTICE.

(Continued.)

Referring in this article particularly to line and underground construction I may say that years of experience and operation has caused considerable of a revolution in the methods and systems of outside construction for central telephone exchanges. Companies are gradually seeing the folly and expense of operating under the old-fashioned method of getting a line to the desired destination with the least possible trouble and expense.

By unsystematic and cheap methods of construction, the maintenance becomes a tremendous item of expense. The lesson has been learned that the first cost is not of nearly so much importance for consideration as the cost for maintenance, and the greatest reduction in this can be secured by the application of good judgment in the installation.

FIG. 1.

For pole line construction, white cedar, chestnut, pine or tamarack poles are generally used, ranging in length from 25 to 40 feet, and are usually set from 5 to 7 feet in the ground. The length of poles and manner of construction may depend to a great extent upon the restrictions and rules governing this work of the municipality through which the line is being run, but regardless of this it is essential to the successful operation of a line that the work be done substantially and according to the rules of good construction.

The most important part of this subject, however, is the equipment in large towns and cities where the lines are necessarily heavy and the obstructions numerous. This work, which is generally a combination of underground and line construction, may be divided into the following recognized classes: Direct Connection, Block System, Pole Distribution and the Ring Terminal, all of which are used in modern and up-to-date work.

DIRECT CONNECTION.

This is the term applied when the underground service is carried directly to the substations without involving the use of any overhead lines. This work is usually done in large office buildings, and a direct cable from the central station will terminate in a suitable

cable box, to which may be connected the individual wires running to each office or, as is very often the case, there may be a house cable connected to junction boxes on each floor and terminating in the same box as the underground cable. In this work there is practically no necessity for fuses or carbon arresters in the cable boxes and consequently they are seldom installed.

THE BLOCK SYSTEM.

A very popular system in Eastern cities is to terminate an underground cable in a suitable cable box (see Fig. 1) attached to the wall of a building in the center of a block. From this terminal, twisted pairs of well insulated wire are run in insulated rings (Fig. 2). These rings, which are iron with a vulcanized rubber coating, are wedged in the walls at suitable distances and constitute a "run" for the distributing wires which radiate from the terminal to each station. This system can only be used to advantage in the thickly settled business section of a city. Very often a terminal of this description is placed on the top of one of the highest buildings in a block and

FIG. 2.

the wires run directly from a fixture surrounding the cable box to the buildings where the sub-stations are located.

POLE DISTRIBUTION.

Fig. 3 illustrates the method of connecting a pole line and an underground cable. The underground cable terminates in a cable box located directly under the cross arms. A cable box which acts as a junction between a pole line and an underground cable should always be equipped with fuses and "ground" protectors to prevent any lightning or foreign currents getting into the cable and causing damage. The "crossconnecting" wires which lead from the cable box to the lines should never enter the box except through a hole in the bottom. This is to insure against weather effects.

The ring terminal system, which has recently become popular and is being very extensively adopted, possesses advantages over most other methods of distribution.

Fig. 4 illustrates a distributing pole having the underground cable terminating in a cable box on the top of the pole. This terminal is equipped with protectors and fuses and covered with a galvanized iron case, having much the

appearance of an inverted ash can. Surrounding the terminal head is a hoop of iron having insulators mounted, and to these are attached the distributing lines which are spliced to twisted pairs connecting them to the cable terminals. These terminal poles are usually very high, and when erected in convenient locations make a very satisfactory distributing medium and constitute a system almost entirely independent of building attachments, etc.

It would be out of the question to try in one article to go into detail on the subject of line and underground construction but the

FIG. 3.

following are a few important points to be remembered. In bringing lines into a building always leave a loop in the wire (known as the "rain drop") just before entering (Fig. 5). The holes through which the wires enter should be bored, slanting downward toward the outside.

If a protector is to be placed on a line arrange to place it as close to where the wires enter the building as possible, and until the wires reach this protector they should not touch any wood but be supported by porcelain knobs. A ground wire attached to a protector should run as straight to the "grounding" point as possible and the fewer turns and angles described the better.

Never connect a line to an underground cable without placing a fuse and ground protector where they join.

Telephone cable should always be twisted pairs. Never use straight conductor cable even if only for a few feet.

All lines which are at all liable to induction should be transposed frequently.

FIG. 4.

Never solder hard drawn copper line wire as it softens the wire and makes a weak spot in the line. Use a special splicing device sometimes called a McIntyre sleeve. This is made of two pieces of copper tube brazed together. The tubes are of such size that the line wires slip easily into them. The ends of the wires are slipped through the tubes from opposite directions and are turned up and cut off. The joint is then twisted, which draws the tubes so closely around the wire as to insure a good electrical contact.

FIG. 5.

Wires attached in cable boxes should be soldered. Do not depend on screw or clamp nut connections.

Article No. 23 will be entitled "The Telephone and Telephone Practice" (continued).

The Utilization of Peat as Fuel.

A scheme for the transmission of electric power and its distribution on an enormous scale is to be tried in North Germany. It is proposed to utilize peat from the great peat beds there as fuel for the generating of electric current that will be distributed to manufacturing centers. It is estimated that an acre of turf ten feet thick contains a thousand pounds of dry peat, and that this is equivalent to 480,000 tons of coke. It is stated that an amount of peat equivalent to 300,000,000 tons of pit coal is available.

COMPARATIVE TESTS OF STREET RAILWAY MOTORS.*

BY C. H. BIGELOW.

In reference to the experience of the bureau of surface lines of the Boston Elevated Railway Company with four-motor equipment, I would say that the Department of Motive Power and Machinery has made a number of comparative tests in regard to this matter, and from the results that we have obtained we do not consider that they would be advisable under our conditions. This does not say that the use of four motors might not be the very best thing under other conditions, but simply applies to the conditions as we have found them in our service.

We equipped one of our standard 25' box cars with four motors and a similar car and truck with two motors of the same kind. The four motors were wired into a K-10 controller, so that each pair was in multiple notches of the controller, all the notches were in multiple.

We found that the four-motor car took considerable more energy to cover the same distance than did the two-motor car. In one run the increase in energy, as measured by wattmeters on each car, was about 50 per cent. The weight of the four-motor car being about 18 per cent. greater than the two-motor car. In this particular test the motormen were not the same; one car following the other over the same route, but other tests made with the same motorman also show large increases in the energy used.

The four-motor car would accelerate faster and would carry more load than the two-motor car (as would naturally be expected). While this quicker acceleration would mean quicker time could be made, provided there were no slower cars in front, yet under the circumstances of the great number of cars operated and the fact that we can now make as fast time as is safe or allowable to do—except perhaps in some places in the suburbs—seemed to show that the quicker acceleration was not necessary, especially at the cost of extra expense for power and equipment.

We made some comparative tests between the two equipments over a stretch of straight level track of about a half mile in length, running both with and against the wind, averaging the results to neutralize the effect of this factor. These tests were made with the same motorman, and in most cases hauling an old horse car weighing about 6,000 pounds, to which was attached a tachometer for getting the instantaneous speed. The track was marked in fifty foot lengths and the cars equipped with areometer and voltmeters, but not wattmeters. Three second readings were taken, and the results showed that the four-motor car only required about 68 per cent. of the time required by the two-motor car to reach a speed of fifteen miles per hour, but took 64 per cent. more current to do it; but as this current was used for a shorter time it only required about 12 per cent. more energy. On other tests, however, we found that it required 27 per cent. more energy for the four-motor equipment to reach this speed. The four-motor car covered the distance of 500 feet in about 11 per cent. less time than the two-motor car, in one set of tests. In other cases we found that the four-motor equipment used about 36 per cent. to 50 per cent. more energy in the

same given time, although it would cover about 20 per cent. more space in the same time.

These tests were made simply during the time of acceleration, and do not refer to the speed that could be reached after the acceleration ceased, which would depend upon the size and make of the motor. The fact that we have the losses due to four motors in place of two would probably explain the increase in power consumed.

There is one thing that the four-motor car does excel in, and that will be conceded by all, and that is the traction. The entire weight of the car is available for adhesion, and the draw bar pull is the maximum that can be obtained upon any given rail, provided the motors are powerful enough to slip the wheel. We have found by experiment (and it agrees with the experiments of many others) that about 25 per cent. of the weight on the driving wheels, on good clean tee rails, is available for draw bar pull, or tractive effort. If you attempt to haul more than that your wheels will slip. In some tests that we made in the subway, in attempting to haul a loaded trailer up the 8 per cent. grade, with various trucks, in all cases where the draw bar pull, or tractive effort, due to the weight of the car and trailer on this grade, the train resistance, etc., exceeded about 25 per cent. of the weight on the motor axles, the wheels slipped, and it was impossible to ascend the grade; while where this draw bar pull was less there was no trouble in climbing the hill. In one or two cases the draw bar pull was just about 25 per cent. and the cars went up with the wheels slipping, but we found it impossible to get up with them the second time. This was probably due to the wheels becoming highly polished, and so having less adhesion for the rail. The power of adhesion is supposed to be due to the minute irregularities of the wheel and rail interlocking. In case the wheel and rail become highly polished these little irregularities are smoothed off, and so we have less interlocking effect and less adhesion.

In the case of the two-motor car before mentioned, both motors were mounted on one truck and about 60 per cent. of the weight of the empty car was carried by the motor axles. This per cent. of the total weight will become less as the car becomes loaded, and of course is quite different from the 100 per cent. which always remains 100 per cent. of the four-motor car.

This question of traction can be improved for two-motor cars by means of maximum traction trucks, where a larger proportion of the weight of the car is carried on the motor axles than on the trailer axles, and also by the device of hanging the motors out from the trucks, instead of between the axles, and the per cent. available for traction brought up to from 66 to 74 per cent.; so the advantages of the four-motor truck in this respect is somewhat reduced.

The claim is often made that the use of four motors will reduce the cost of maintenance. I do not think this would be so under the condition of four motors in place of two, the combined power of the four being equal to that of the two, but if you have a line where the load is too much for two motors and the two-motor equipment is being rapidly baked out, and you put four motors of the same size, practically doubling the power on the car, and thereby reducing the load on each motor and the heating as well, the life of the motors

* Paper read at the February meeting of the New England Street Railway Club, Boston.

should be very much increased. The cost of maintenance would be apparently cut down, but you have more parts to look after, and if the four-motor equipment gets loaded to the same extent as the two motor has been, the cost per motor would be the same.

And the fact that these motors were the same size, of course we had double the power, and with the four motors we were running the four motors away down on the curve, where the losses would be much greater.

As already mentioned, the conclusions to be drawn from these tests would apply simply to our conditions and not necessarily to other conditions, or to conditions that might arise in the future in our own service. Every problem of this sort is an engineering problem and should be looked at from an engineering standpoint. We cannot take the results obtained from a series of tests made under certain conditions and draw conclusions to fit every case. When we come to the conditions of larger, heavier cars used for interurban service, over long and difficult grades, and the necessity of making quick time, the question of two or four motor equipment should be carefully looked into, and the question of traction and the ability to make time on a poor rail are often very important considerations; and so the question whether to use two or four motor equipment should be decided for each particular case by competent engineers after careful consideration.

NOTES ON THE ELECTRICAL TRANSMISSION OF POWER IN COAL MINES.*

BY H. RAVENSHAW.

The object of this paper is to discuss the special features met with in electric power plants in coal mines, and to give a record of difficulties and mishaps which have come directly before the notice of the author during the last ten years.

A great many of these plants are now in use, and are doing good work all over the country, lighting, pumping, haulage, and coal cutting being the principal uses to which electricity has been put.

LIGHTING.

It is usual to employ a separate plant for lighting, as the lamps are required in the pit night and day. A pressure of 220 volts is usually employed for the lighting circuits and from 300 to 800 volts for the power.

Underground engine rooms, which are at a considerable distance from the generating station, are often lighted from the power mains with several lamps in series. The light is generally very much appreciated, especially at the shaft bottom, and at landings where there is often a good deal of shunting carried on. Where the mine is dry, simplex steel tubing can be used to great advantage in places where there is not likely to be a fall of roof. There is an immense amount of primitive wiring in use, it being quite usual to run the wires on insulators and for the workmen to bare the two wires and hang a lamp across wherever they want it. This is, of course, only done in the parts of the mine which are not fiery.

Inclosed arc lamps are very suitable for screens and pit heads, as well as for the pit bottom.

* Paper read before the Institution of Electrical Engineers, London, Eng., March 28, 1901.

GENERATING PLANT.

Very low steam pressures are usually employed at collieries, and, coal being comparatively cheap, the steam engines are often of a primitive pattern. Condensing plants are seldom used.

Old winding engines are very often employed, and have the advantage of being extremely reliable; as a rule, however, they do not govern at all well.

For power the units are usually from 100 to 200 ihp. and for lighting 50 ihp. In the best plants Corliss and vertical engines, with fly-wheel governors, are employed. These drive the dynamos with ropes or belts.

Some of the best mines, however, are employing higher steam pressures, and vertical high-speed direct coupled sets.

The most important requirement is absolute reliability, as spare plant is seldom put down, and the machinery often works for at least 16 hours a day.

GENERATORS.

Owing to the fact that non-condensing steam engines are used, there is always a great deal of steam about the surface works of a colliery, and this, combined with the immense amount of fine coal dust, covers everything with a film, which is by no means a good insulator.

For this reason it is not advisable to employ dynamos which have internal ventilating spaces, and in any case all insulating materials have to be of the very best quality.

The greatest care has to be taken with spare machines and armatures, as these are liable to get very damp.

The author has known armatures which were not suitably insulated to break down one after the other, and this is generally found to occur on damp days in January or February.

Exactly similar machines which were working underground, where everything was very dry, gave no trouble whatever.

The load on the generators is likely to be extremely variable, there being as a rule only two or three motors on the circuit, which may all be stopped at the same time. It is quite usual with haulage for the load to vary from 25 per cent. over-load to open circuit in a very short space of time. It is, therefore, most important that the generators shall run without requiring any attention to the brushes. One man as a rule looks after a fan engine and all the electric light and power engines and dynamos, and if the machinery is suitable he has a very easy time.

SWITCHBOARD.

Owing to the atmosphere being charged with damp coal dust, the switchboard must be thoroughly insulated and must be fire-proof. In a switchboard largely adopted by the author, the slate slabs are thick and rest on a low wall of glazed bricks, the top being supported from the wall of the building by iron brackets. The only woodwork is a strip of teak along the top of the slates, fastening together panels of the same potential. The slates have the edges beveled, and there is no wood or metal framework.

Owing to the fact that single armored cables are generally used, any sudden break sets up an enormous tension on the insulation, and it is best to employ massive slow-break switches of the simplest character. A most important instrument for the switchboard is a megohm-meter, arranged to read direct the in-

sulation resistance between either pole and the earth.

A log is kept of the insulation, and any leak put right as soon as possible. Where men's lives depend to a great extent on an absence of leakage, it is of the greatest importance that everything should be kept in first-rate order.

CABLES.

For shaft work there does not seem to be anything better than Callender's Armored Vulcanized Bitumen Cables, and when these are protected from falling objects and are kept well coated with Stockholm tar, they will last a very long time. The cables are almost always carried down the down-cast shaft, as the fumes and steam in the up-cast shaft are very injurious to the armoring. The cables should be so fixed that they will not be struck by any corves or other trifles which have a habit of falling down the shaft.

Underground cables are generally suspended from the props which support the roof; they are hung fairly slack and should be suspended by loops of yarn or leather and not nailed up with cleats. If thus supported, in case of a fall of roof, the cables fall to the ground, and are not so likely to be cut through.

Ordinary rubber and lead-covered cables are often used, but a good armored cable is greatly to be preferred.

All joints should be made in proper joint boxes, as solder cannot be employed, and a single pole switch should be fitted on each conductor wherever there is a junction. Double pole switches should not be used, but single pole coupled externally. These switches should be entirely lined with slate, and made so that there is no possibility of an arc being started to the case.

The switches should be made so that they will break the circuit with certainty in case of a short circuit.

SWITCH GEAR FOR MOTORS.

Where the cables enter the underground engine-room, they should be connected to two single pole switches, similar to those mentioned in connection with the junctions.

It is most important that the shunt circuit of the motor should not be broken, as the extremely high tension at breaking causes a vicious spark and puts tremendous stress on the insulation. By far the safest plan is to connect permanently across the shunt coils a non-inductive resistance of about twice the resistance of the fields. The current used is very small, and the field circuit can be broken with impunity.

The author has known the shunt coils of a motor to be left on and to be broken by switching off at the surface, thus causing an enormous stress on the insulation of the mains. All series coils should also be fitted with a similar resistance. Precautions such as this reduce the flash from the switches, or, in case of a broken cable, to a very great extent.

MOTOR STARTING SWITCHES.

If a good double pole break is arranged where the cables enter the engine room, a single pole starting-switch can be employed. This is rather important, as the parts of opposite potential are kept well apart. The author has employed liquid switches with a good deal of success; but it must always be remembered that, where they are used for regulating, steam is given off and ventilation must be allowed, so that leakage is not caused by the condensed steam.

In any case, all resistances should be made

so that they will carry the full working current, as they are sure to be used some time or other for regulating.

The cones of liquid switches are of either iron or lead, and should be made so that they can be easily examined and replaced.

Where there is gas, all switches must be entirely inclosed.

MOTOR.

There appears to be a fairly general opinion that there is a great deal of danger from the explosion of gas ignited by the sparking at the brushes, and a number of experiments have been carried out which do not seem to have proved anything one way or the other. Whether this is so or not, it is perfectly obvious that the heat from a burnt-out armature or the arc from a broken circuit would be quite sufficient to ignite gas, and where there is any chance of gas being present it is necessary that the armature and commutator at least, if not the fields, should be inclosed in strong gas-tight cases. All the terminals should be made so that cables cannot be accidentally pulled out, and the machines should be of such construction that they will pull up at once in case of a bad leak or short circuit. It is well known that a gramme armature will go on running for some time with a burnt-out coil, all the time doing itself a very great deal of damage and developing a quantity of heat. A drum armature, however, in which the conductors of opposite potential are close together, will stop at once if there is a short circuit in the armature, and if proper fuses are fitted the machine is at once cut out. This is a most important feature in this type of machine, and gramme armatures should never be used for any underground mining machinery.

Totally inclosed machines are by no means in favor among colliery managers, as they are difficult to keep clean and to inspect, and the general opinion seems to be that an open machine is to be preferred, precautions being taken that the engine-room is kept free from gas.

Inclosed machines are certain to be run some day with the covers loose or entirely off.

It is possible to obtain motors which will not break down and which do not spark at the brushes, and with careful supervision and an organized testing of the insulation from the switchboard in the generating station, there should be no danger from fire or explosion.

PUMPING.

The advantages of electric motors for this work are obvious, and a large number of pumps are in use. Compound motors are generally employed, as they will not run away if the pump loses its water. Owing to the damp places in which they usually work, pump motors are often entirely inclosed, and shunt wound machines under these circumstances are apt to give trouble owing to the resistance of the fields rising as the machine gets hot. This increases the speed and the armature current. The addition of a fair amount of series winding prevents these difficulties from arising.

HAULAGE.

The author cannot quote a single instance in which electric locomotives have been employed in coal mines. Wire rope haulage appears to be almost entirely employed.

With continuous rope haulage the motor usually runs at a constant speed, the rope-pul-

leys being started and stopped by means of clutches.

With single rope, and main and tail haulage the electric motor is shown to advantage, the smoothness of starting and complete control over the speed, as well as the ease of reversal, giving an extremely handy hauling engine.

COAL CUTTING.

The motors employed for coal cutting are usually series wound, and are subject to extreme variations of load and to very great shocks. They are entirely inclosed, and are consequently liable to get very hot. It is, in fact, difficult to imagine a more trying load.

With these motors it is, of course, imperative that they should be entirely inclosed, both for the protection of the armatures from falling coal and to keep out the coal dust.

It is most important that effective switches and cut-outs should be fitted at the junction where the motor cables are carried from the main cables, so that, in case of damage to the flexible cables or of burn out in the motor, both poles are quickly cut out.

GENERALLY.

The amount of bad or unsuitable work to be found in colliery installations is very surprising, and it is apparently only due to the strict supervision and high order of intelligence to be found among those in responsible positions in collieries that there are so few accidents.

With good work electric power transmission is an immense boon, and there should be a very great field for extensions.

As the author has not employed any multiphase motors in mining work he is not in a position to discuss their use. Many of the points raised, however, will apply to both systems.

As one mishap gives more instruction than many years of steady running, a list is given herewith of a number of accidents and defects which have come directly before the notice of the author. For obvious reasons the actual localities are not given:

A. Engines.—A stud sheared which fixed a flywheel governor in place. The engine ran away.

B. Dynamos.—Three armatures broke down one after the other, stopping the pit for three days. The first armature broke down. The spare dynamo had not been run for several months and on starting up burnt out. The spare armature had been kept in a damp place and broke down at once. All these armatures were only insulated with compressed paper.

C. The brushes for three dynamos cost £40 in one year, and armatures constantly broke down owing to over-heating. The brush-holders were originally few in number with large carbon blocks. These were changed for a number of holders, each carrying a small block of carbon. After this alteration the machines ran well and a set of carbons now lasts for many months.

D. A number of instances of short circuits have occurred, owing to the ventilating spaces in the armature becoming filled with coal dust. The armatures often broke down after they had been standing for some time. The coal dust seems to absorb moisture.

E. Switchboard.—An arc was started at 600 volts between two contacts about 1½ minutes apart at opposite potentials on a switch connected to a megohm-meter. The base of the switch was ebonite, and the leak was due to a fine layer of damp coal dust.

F. In another case a voltmeter was entirely burnt out, evidently from the same cause.

G. While there was a heavy earth on the mains an arc was started between a switch on the engine-room switchboard and part of the metal framework supporting the slate. This was evidently due to coal dust.

H. Cables.—Two armored bitumen cables were laid in a wooden trough, which was close to a leaking steam-pipe. Both cables went to earth within a few hours of each other. The trough has since been filled with bitumen and no further trouble has occurred.

I. A nail fastening up a cleat had evidently been driven through an armored cable, passing through the insulation but not touching the conductor. This finally came in contact with the conductor, and, as there was a bad leak but not a dead earth on the other pole, an arc was set up and a very serious fire only prevented by the fact that the assistant manager was close by and telephoned to the engine-man on the surface to shut down.

J. A common twin cable was carried down a shaft for lighting a mine; 60 volts were lost in this cable, the volts at the surface being 110 and in the mine 45 to 50.

K. A runaway train of tubs cut through one of the cables. The accident happened close to a box containing a double pole branch switch. The drag on the cables broke the marble bases of the switch into several pieces and an arc was started to the iron case.

A number of cases have occurred where runaway trains have cut the armored cables clean through.

L. Motor Switches.—Owing to there being no stop inside the switch, and the handle being put on the wrong way, a double pole switch was carried back too far and a short circuit effected between opposite poles.

M. A main regulating switch was not marked, and was arranged to switch off left-handed instead of right-handed. An accident occurred to the gear, and the attendant, instead of switching off, switched on to full speed.

N. A double pole inclosed switch was fitted with a fiber arm. The insulation of the fiber broke down and caused a short circuit.

O. A single pole inclosed switch had a cast-iron arm supporting the moving contacts. The arm broke in switching on, but the contacts remained in position. It was therefore impossible to switch off the current as there was no double pole switch fitted.

P. A gas-tight cover to a liquid switch was fastened by clamps binding the porcelain jar very tightly. The jar cracked when it became hot, and caused a partial earth owing to leakage of the solution.

Q. Owing to insufficient room being allowed for a liquid switch gear, the steam from the solution caused an arc to be started between opposite poles on several occasions.

R. A double pole switch in the shunt circuit of a compound motor worked perfectly well on the surface when tested with its own motor. On being erected underground, at the end of several miles of armored cable, the length of break was not sufficient and an arc carried on between the contacts.

S. Motors.—In several cases a gramme armature has gone on running with a short circuit in the armature, burning the armature to a cinder.

T. No record has been found of a drum armature running on with a short circuit. Several cases have occurred in which the armatures

have pulled up at once from a short circuit, the damage to the coils being very small.

U. A cable was brought from the magnets of a large shunt motor to a switch in another part of the engine-room. This cable was loosely run, and was accidentally pulled out of the connection. A tremendous flash was the result, the commutator was badly damaged and the fuses on the surface blown.

V. The shunt circuit of a compound motor was broken, and the motor ran away.

W. After some repairs the series coils of a compound motor were connected up the wrong way. The machine gave a great deal of trouble and it was some time before the mistake was found out.

X. A shunt motor driving a pump was driven by a shunt dynamo through a long line. The motor was inclosed, and the fields became very hot. The field of the motor being weakened, the current increased, and it was found to be impossible to run the plant for more than two or three hours at a time.

THE SYNCHRONIZING OF ALTERNATORS.*

Of all central station apparatus, probably less advancement has been made in that appertaining to synchronizing than in any other of the many instruments in daily use in a generating station. We are practically in the same position in this matter as we were years ago, with the exception that the voltmeter has very generally taken the place of the incandescent lamp as an indicator. The importance of good synchronizing as opposed to the old haphazard style of throwing the switch in almost anywhere, and allowing the machines to pull themselves in, is daily becoming more recognized, especially in the larger stations, and when we consider the evil effect of perpetual bad synchronizing on a machine in the way of racking the coils and of setting up undue electrical strains in the armature, it is only right that it should be so.

Because very little progress has been made in synchronizing methods, it cannot be argued that the present system is perfectly satisfactory, although of the few that have been tried it is certainly the best.

Synchronizing as it is now performed leaves too much to the skill of the operator; indeed, everything depends upon it. A nervous or unskilled man may cause hundreds of pounds worth of damage by being a second or two late with his shot. This is especially likely to occur in a breakdown, where, perhaps, the machines that are running are heavily overloaded, owing to the sudden failure of one or more of the others.

Under these conditions, synchronizing with the present apparatus is an extremely difficult operation to perform, and calls for the greatest coolness and skill on the part of all concerned. Alternators that are heavily overloaded will sometimes tend to come out of step, which of course is due to the engine, and not to the alternator; the result of this is that the phases shown on the synchronizing voltmeter become very erratic and unreliable, and often necessitate what is known among central station engineers as a "flying shot."

This is always a more or less risky proceeding, but with the present system it is the only one possible in a breakdown. The writer cannot offer any suggestions for what must needs

be a very radical improvement in synchronizing methods, but feels that some of our master minds might with profit devote a little attention to this somewhat neglected point. In a breakdown of the above type it is very usual for the voltage to fall so low that the synchronizing voltmeter becomes useless, owing to its frequently not being designed to read accurately below 75 volts or thereabout. In central stations fitted with this type of synchronizing voltmeter, recourse must be had to the engine driver's pilot lamp, which under these conditions can be of but very little value, owing to its never reaching more than a red glow. To meet this emergency at some stations, in addition to the usual synchronizing voltmeter, a low reading voltmeter has been fitted to the switchboard and used for synchronizing at low volts. It is, of course, quite possible to use a voltmeter that reads over a wide range, but instruments of this type are never so dead beat or so generally satisfactory as those designed to read only on that part of the scale where they are presumably to be used. The old style of synchronizing by an incandescent lamp was extremely unsatisfactory, owing to the great lag of the light behind the voltage, and to the uncertainty as to when the lamp was at its maximum brightness. On account of this latter defect it was never possible to guard against what may be termed a "short phase," that is to say, a phase where the secondary voltage of the synchronizing transformer does not rise to its maximum, but after nearly reaching it, suddenly falls back to zero. Short phases are of common occurrence in synchronizing, and when using a lamp only it is practically impossible to tell them from good ones; as after the lamp has been flickering up and down for a minute or two the eye cannot discern the difference occasioned by four or five volts. All central station engineers know that short phases are things to be avoided; switching in on one is at the best bound to result in a very bad shot and may, unless the machines are designed to pull in, easily cause more or less damage. A voltmeter is greatly superior to a lamp in this case, but in the negotiation of a short phase it still leaves much to be desired.

The fault of lagging is not only confined to the lamp; the best voltmeter has it, although in a modified degree. The lag in a voltmeter is, of course, caused by the inertia of the moving parts and also by the damping arrangement. In a quick phase the inertia tells by causing the voltmeter to kick, and to momentarily show in some cases a much higher voltage than is across its terminals. This, however, is not of any importance, as a quick phase should never be taken except in emergency.

With the ordinary slow phase, the inertia causes no kick, and the only thing left to experience is to know how much to allow for the lag of the instrument. This, of course, is a variable quantity, depending entirely on the speed of the phase; the quicker it is, the more must be allowed, and vice versa. Some engineers prefer what may be termed a "standing phase," that is to say, one where the synchronizing voltmeter needle rises to the maximum and stops there for several seconds. While phases of this type should be theoretically perfect, they are often in practice found to be anything but desirable.

There is always an element of uncertainty about them; if they slowly move a volt or two

down and then come up again they may be taken with safety, but when the needle stands still with perhaps a tiny quiver they are risky, as the phase may be going back, although the inertia of the moving parts keeps the needle momentarily at the maximum. The result of closing the switch too late is always worse than that of closing it too early. Rather be early than late is as sound a maxim in synchronizing as in everything else. The reason is, that in an early shot the electrical action set up between the machines on the closing of the switch acts in the same direction as the engine which is bringing them into phase; but in a late shot the action is opposed to that of the engine, the motoring current between the machines tends to pull them back into step while the engine is doing its best to pull them out, as is seen by the fact of the synchronizing voltmeter needle going back.

Hot-wire voltmeters are, of course, the best to use for synchronizing; their inertia is small and there is not much need for damping, they have possibly more lag than an electro-magnetic instrument, but the latter is apt to be so violent in its action that its indications are not always reliable. One of the best synchronizers is that made by Messrs. Ferranti and fitted to all their switchboards. In their latest type they connect a couple of low candle-power incandescent lamps in parallel with the synchronizing voltmeter and place them underneath it, and this has the effect of greatly helping the eye to determine the correct moment for closing the switch. The voltmeter used is of the Hartmann and Braun hot-wire type and is very satisfactory.

When lamps alone are used for synchronizing, it is useful to remember that the lower the candle-power the better the result. The lag of the light behind the voltage increases with the candle-power of the lamp, owing to the thicker filament taking longer to attain incandescence. Two-phase alternators are synchronized in the same manner as single phase. The incoming machine is synchronized on one phase, and the linked switches of the two-phases then thrown in together. Of course they could be thrown in separately, as if one phase is in synchronism with the bus bars, so must the other one be, as they are rigidly connected in the machine, and therefore bound to keep the same phase difference. It is better, however, to switch in both phases at once, as, if the shot is not all that it might be, the machines will pull into step much easier with both halves of the armature helping than they would with one alone. The link on two-phase machine switches should, however, be removable, so that if the machine fuse on one phase should blow, it would not be necessary to open both switches to replace the one fuse.

Wireless Telegraphy to Replace Carrier Pigeons.

It seems that almost before they have demonstrated their full use in the navy homer or carrier pigeons are likely to be abandoned as a means of communicating between ship and shore.

Secretary Long has appointed a naval board, headed by Captain Chadwick, to determine whether or not the homer pigeon service should be given up. This action is taken in view of the successful application to naval purposes of the system of wireless telegraphy that has been made abroad.

Up to this time, for lack of funds, our navy

*From the "Electrical Review," London.

has done little to adopt this system, but with the money available under the new appropriation bill, it is expected that it will be brought up to date in this respect.

WHY SOME MEN SUCCEED.*

The man who expects to rise in this world must firmly make up his mind at the very start that, come what may, he will succeed. He must develop a firm conviction that it is possible to him, that he was made for it, that it is his birthright, a right of which he cannot be deprived by any combination of adverse circumstances. He should ever remember that success is as much his due as the acorn has the right to become the gigantic oak, or the small spring the mighty river.

Perhaps the first requisite is to develop an ideal in life, and constantly urge himself on to attain it. Be that ideal whatever it may, have a care that it is an honorable, a noble one. Aspire to something above the common level, and work up to it. Study yourself and find wherein your talents lie, and make that the foundation of your career. It is not for you to ask whether you can make a Webster, a Lincoln, a Grant, a Gladstone, or a Bismarck, but make the very best kind of a man of yourself that you know how, and never fail to try to find out the possibilities within yourself. You will win enough of the honors of this world and of your own conscience when you finally succeed in this undertaking.

Many, simply because they think they cannot make something great of themselves, simply make nothing at all. It is as much your duty to develop your one talent, if you should happen to possess only one, as it is to develop ten; and if you develop that one conscientiously and thoroughly, you will be just as great a success as the one who develops ten. Make your motto: "What man has done, man can do," and fight it out on that line with all of the grit, vigor and determination possible to you.

The most unquestionable badge and ensign of a sovereign mind is that tenacity of purpose which, through all changes of companions, fortunes or surroundings, changes never, bates no jot of heart or hope, but wearies out of all opposition, until it safely arrives at its port or goal. Then comes the serenity resultant from having safely weathered a tempestuous storm on the seas of life, and having at last safely reached a friendly harbor.

Phillips Brooks tells us that "No true man can live half a life when he has genuinely learned that it is half a life. The other half, the higher half, must ever haunt him." In doing our duty to ourselves in this matter, we must necessarily do it to those whose interests are linked in ours.

Progress may seem slow at the start, in fact, it may be imperceptible to us, but Emerson truly says that "What a man is engraves itself on his face, on his form, on his fortunes, in letters of light, which all may read but himself."

John Wanamaker, in summing up a lecture to young men on this subject some months since, advised them to remember at all times this one sentence: "Do your best, that is the road to success."

He happens to be one of those men, who by his own efforts and will power, raised himself from the very bottom of the ladder to its top-most rung of honor and success, and as a conse-

quence his advice should contain some elements of practicability.

Develop yourself, your strength. The habit of depending on self, the determination to find one's resources within one's self, and not without, will develop strength. Crutches were made for cripples, not for able-bodied men with sound minds; and whoever attempts to go through life on mental crutches will not go very far, and will never be very successful.

"Life without industry is guilty, and industry without intellect is brutality."—Ruskin.

Failure, like disease, is abnormal. Nothing is more depressing than holding for years the thought of defeat, or that you are unlucky and are not intended for success as others are. The very thought is debilitating. Fear of failure, or lack of confidence in one's ability, is one of the most potent causes of failure. Convince yourself of your ultimate success; cultivate hope, and the thought that true merit seldom goes unrewarded. Remember that "True hope is based on energy of character. A strong mind always hopes, knowing, as it does, how slight a circumstance may change the course of events."—Von Koeber.

That success is a normal condition is shown by the fact that it is a great health tonic. People who have been in delicate health for years, upon suddenly or unexpectedly achieving some signal success, immediately improve in health. The mind acts upon the body, and there is a rebound from the old depressed condition to the vital, the normal, the healthy. Holding a success thought brightens your outlook, your view, all seems better, and it scatters your specters of doubt and fear, and sends an electric current of hope and power through you that will revolutionize your possibilities and transform you into a new being.

EXPERTS STUDYING THE VARIOUS ELECTRIC TUNNEL SYSTEMS.

In the progress of the work on the New York Underground Rapid Transit road, which is going ahead at a rate unprecedented in the history of public works in this city, the New York "Sun" says that the preparation for the future electric equipment is not neglected, although laymen looking on at the work are sometimes inclined to think that it is forgotten or unjustifiably ignored. On every section of the road that is building the contractors are putting in sixteen or more ducts or conduits for cables. These are being provided not only for the immediate future of the road but for the more remote requirements.

But this is only the groundwork, as it were, of the electric equipment for the underground road. With the ducts provided for the cables which are to carry the electric power the question of how the power is to be applied to the train motors is one that may be considered and answered at whatever time becomes convenient.

John B. McDonald has about three years yet in which to complete his contract for the construction of the road, although he said that he could complete his contract in a year less than the legal limit, and competent authority in the Rapid Transit Commission declares that at the rate of progress at present Mr. McDonald can do this. This means that the construction work will be completed in about two years. Even so, there is abundant time ahead for contracts for the electrical equipment of

the road, according to the electric men of the city, and it is said that the reason no other sign than the ducts along the subway is to be seen at the present time is that the contractors are waiting to take advantage of the latest devices in electric engineering.

It is a common idea, which electricians generally concede to be accurate, that the advances in electric science follow so closely upon one another that almost from day to day some step of progress is recorded. In the circumstances delay in the closing of contracts for the equipment of the underground road might be expected to inure to the benefit of the contractor and of the public.

It is said that no radical or systematic advance has been made in the way of the electric motor since its inception as a practical factor in commercial traction a decade ago, but small mechanical improvements have been made, and above all there have been advances with each great successful installation of an electric power plant in various parts of the country in the past few years of which the New York underground road will reap the advantage.

The road will at any rate have the advantage of the experience gathered at Boston and Chicago and Niagara Falls, and, it may be, of that founded upon the installation of the "two-penny tube" in London. For not less than eight months the projectors of the road under the contract let by the Rapid Transit Commission have been considering a plan, or rather many plans, for the electrical equipment of the road, and a few months ago the Rapid Transit Subway Construction Company selected as its electric director L. B. Stillwell, whose most recent achievement has been the construction of the power house and plant of the Manhattan Railway Company at Seventy-fourth street and the East River.

The plant of the Manhattan Railway Company is the largest up to the present time erected anywhere in the world. Mr. Stillwell had had experience before his connection with this enterprise with electric work in Boston and at Niagara Falls, where he was the electrical director of the Niagara Falls Power Company.

The construction company has not stopped here, but has brought on another electrical expert from Buffalo, Mr. Stott, who has had experience in the electric light, heating and traction business of Buffalo and its vicinity. It is said that the problem of electric traction in the New York subway is to be solved practically on the experience derived in the operation of the Chicago elevated railroad and the Buffalo and Lockport road.

There are Philistines, however, who say that it may be that the experience of London will make a difference with New York before all is said, in that the Ganz Company of Budapest has offered to equip the London road with its alternating current system for \$100,000 less than the terms fixed by the electric equipment agencies which utilize the direct current. No large plant in this country designed for traction purposes, is based upon the system proposed by the Ganz people, it is said, although one of the great electric companies of this country is known to favor that method when possible.

Mr. McDonald's people are reticent as to their purposes regarding the electric equipment of the underground road as yet, but it is understood that they have had representatives

*From the "Mechanic."

abroad, as well as looking into the possibilities of electric traction here.

According to the information obtainable it has not yet been determined even whether the New York road is to have third rail or overhead trolley power supply. It is expected, however, that the third rail system will be adopted ultimately. The overhead trolley system is open to the objection that the method of applying it would have to be different in the tunnel and when the road runs on a viaduct, it is said by the engineers. The third rail system, besides being very practical, has the advantage of very low maintenance cost.

It is worth while here to tell an incident of the late Charles P. Clark's railroad life. According to men who should be well informed on the premises, to Mr. Clark is due the idea of the third rail as a means of supply of the electric current for railroad traction purposes. A friend of Mr. Clark's said recently:

"The first practical use of the third rail was on the Nantasket Beach branch of the Consolidated road, and later on the new Berlin and Hartford branch. Mr. Clark told the men who had the experiments there in charge that what he wanted was a system which would permit the use of the articles common in the operation of a steam railroad. He did not, he said, want a system which would necessitate the employment of a whole new staff of electrical experts who must have also a machine shop of their own and what not. He desired that those things be utilized which could be readily replaced by the railroad shops and mechanics, and for this reason largely the third rail as a feeder of the electric current came into use."

The location of the electric plant for the Rapid Transit road has not been made known to the public yet, if, indeed, the managers of the company have decided upon one. It is said that although a single great plant is most likely to be the plan fixed upon, it is possible that the builders of the road may determine to operate from several different central stations, perhaps three.

Should the present company build the tunnel to Brooklyn, it is said to be quite likely that one of the central power stations would be on that side of the East River. It is held to be generally desirable to have the central plant, if there be only one, as near as possible to the theoretical load center, which in the case of the Manhattan elevated roads is figured at or near Fifth avenue and Fifty-third street, and presumably it would not be far from that point in the case of the Rapid Transit road. The Manhattan roads, of course, could not locate the big power house from which they are to be operated by electricity at that central point and so a site was selected at Seventy-fourth street and the East River, which is said to be a very satisfactory location.

That the company which is building the tunnel road under Mr. McDonald's direction has plenty of time yet to consider and plan in the matter of providing an electric plant to run the road may be realized when it is told that men familiar with electric equipment operations say that large as the demands of the Rapid Transit road will be in the way of electrical machinery, a full equipment can be completed without undue haste in a year or fourteen months. The public idea is that the Manhattan and Metropolitan companies have been so long a time in putting up their plants that such a work must necessarily be of a slow character. Neither of these companies, however, has had any need to hasten the work on the electrical plants.

INCORPORATIONS.

The Sullivan Electric Company, Sullivan, Ill. Incorporators: J. H. Baker, W. A. Steele and A. J. Patterson.

The Fox River Gas & Electric Company, Oshkosh, Wis. Capital stock, \$350,000. The stock is held by Oshkosh men.

The Brice Gas & Electric Company, Mason City, Ia. Capital stock, \$300,000. Incorporators: W. E. Brice and C. H. McNider.

The Camp Floyd Electric Company, Provo, Utah. Capital stock, \$20,000. Incorporators: A. L. Woodhouse, J. R. Hauch, W. S. Jennens and S. C. Lockner.

The Cloquet Electric Company, Cloquet, Minn. Capital stock, \$50,000. Stockholders: James Richardson of Duluth, H. C. Homly and J. E. Lyons of Cloquet.

The California Central Gas & Electric Company, Sacramento, Cal. Capital stock, \$1,500,000. Incorporators: J. Martin, J. A. Britton, E. H. Pierson and H. U. Roeding.

The Stone City Light, Heat & Power Company, Bedford, Ind. Capital stock, \$100,000. Directors: Thomas F. Barrett, Edward McSweeney, James E. Bruff, James E. Pitts and Thomas O'Doggy.

671,032. Controlling Apparatus for Signal-Operating Systems for Railways. Benton C. Rowell, Chicago, Ill., assignor to the Rowell Potter Safety Stop Company, Portland, Me. Filed Feb. 13, 1899.

671,179. Trolley-Car. Louis A. Brod, Brooklyn, N. Y. Filed Aug. 15, 1900.

671,404. Electric Block Signal System for Railways. Harry Shoemaker, Philadelphia, Pa., assignor of one-half to Gustave P. Gehring, same place. Filed Nov. 26, 1900.

ELECTRIC LIGHTS AND APPLIANCES.

670,927. Incandescent Electric Lamp. Charles R. Campbell, Huguenot, N. Y., assignor to himself and Howard H. Bush, New York City. Filed July 12, 1900.

670,949. Adjuster for Incandescent Electric Lamps. Lewis A. Carpenter, Revere, Mass., assignor to Frank W. Morse, Boston, Mass. Filed Sept. 12, 1900.

670,988. Automatic Protecting and Detecting Device for Electric Light Circuits. Harry Etheridge, McKeesport, Pa. Filed June 19, 1899.

670,994. Electric-Lighting System. Joseph A. Mesiroff, Milwaukee, Wis. Filed April 30, 1900.

671,195. Shade Holder for Electric Lights. Edwin O. Pease, Bangor, Me. Filed Nov. 21, 1900.

671,338. Conductor and Contact for Electrical Glow-Lamps. Julian A. Halford, Bayswater, Eng., assignor to the Electric Lighting Boards, Limited, Pall Mall, London County, Eng. Filed Sept. 10, 1900.

ELECTRICAL MACHINERY AND APPARATUS.

670,952. Potential-Regulator. Augustine R. Everest, Lynn, Mass., assignor to the General Electric Company of New York. Filed Sept. 24, 1897.

671,079. Contact-Finger for Electric-Motor Controllers. Frank W. Garrett, Johnstown, Pa., assignor to the Lorain Steel Company of Pennsylvania. Filed July 24, 1900.

671,084. Electric Welding Apparatus. Henry F. A. Kleinschmidt, Johnstown, Pa., and Frederick A. Phelps, Jr., Newark, N. J., assignors to the Lorain Steel Company of Pennsylvania. Filed April 24, 1900.

671,249. Rectifier. Elihu Thomson, Swampscott, Mass., assignor to the General Electric Company of New York. Filed Jan. 9, 1900.

671,265. Electric Recording Instrument. Frank P. Cox, Lynn, Mass., assignor to the General Electric Company of New York. Filed July 9, 1900.

671,278. Electrically Controlled Switch. Edward M. Hewlett, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Dec. 30, 1898.

671,279. Measuring Instrument. Charles S. Jameson, Swampscott, Mass., assignor to the General Electric Company of New York. Filed Dec. 23, 1898.

671,282-671,283. Electric Meter. Elton J. King, Fort Wayne, Ind., assignor to the General Electric Company of New York. Filed Jan. 20, 1900, Jan. 31, 1901.

671,289. Controlling Rotary Converters. Samuel W. Manger, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Jan. 16, 1901.

671,349. Electric Signaling Apparatus. William H. McClure and Dennis E. Healy, Worcester, Mass., assignors to the Gamewell Fire Alarm Telegraph Company, New York City. Filed Dec. 8, 1899.

TELEPHONES AND TELEPHONE APPARATUS.

671,311. Telephone Call-Box. Ward Decker, Owego, N. Y. Filed April 20, 1899.

MISCELLANEOUS.

670,931. Thermostat. Charles B. Garrett and William S. W. Blake, Minneapolis, Minn., assignors of one-third to Martin Dyke, same place. Filed Feb. 6, 1900.

670,913. Electric Fire-Engine and Hose-Carriage. Wilbur M. Whitlock and Edgar P. Harrison, Newark, N. J. Filed April 21, 1899.

670,946. Electric Igniter for Gas-Engines. Jacob L. Ash, Lansing, Mich. Filed Nov. 4, 1899.

670,964. Telegraphy. Donald Murray, New York City, assignor to the Postal Telegraph Cable Company, same place. Filed Jan. 17, 1901.

670,980. Telegraphic Instrument. Ambrose S. Bissell, New York City. Filed Sept. 4, 1900.

671,046. Telegraph-Recorder. George L. Foote, Brooklyn, N. Y., assignor to himself, H. G. Pierson and Charles Freemann, copartners under the firm name of Foote, Pierson & Co., of New York. Filed Jan. 29, 1899.

671,106. Automatic Stop for Electric Elevators. Allan Cowperthwaite, Brooklyn, N. Y., assignor to Alonzo B. See and Walter L. Tyler, same place. Filed Feb. 4, 1901.

671,139. Electric Heater. Alexander R. Leask, London, Eng., assignor of one-half to Percy Morgan Bellis, same place. Filed Dec. 13, 1900.

671,258. Attachment for Controller-Handles. Albert H. Armstrong, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Jan. 22, 1901.

671,259. System of Motor Control. Charles E. Barry, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Jan. 29, 1900.

671,271. Electric Fuse. William L. R. Emmet, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Jan. 27, 1900.

671,272. Electric Metering System. Walter C. Fish, Lynn, Mass., assignor to the General Electric Company of New York. Filed Jan. 18, 1899.

671,273. Metering Electric Energy. Walter C. Fish, Lynn, Mass., assignor to the General Electric Company of New York. Original application filed Jan. 18, 1899. Divided and this application filed Jan. 26, 1901.

671,334. Construction of Morse's Registering Telegraphic Instruments. Eugene Ducretet, Paris, France. Filed July 29, 1898.

671,350. Alarm System. James H. McCracken, Washington, Ind. Filed Nov. 23, 1900.

671,388. Device for Protecting Safes Against Burglars. Anthony P. Prichard, Tacoma, Wash. Filed Feb. 6, 1900.

671,403. Wireless-Telegraph System. Harry Shoemaker, Philadelphia, Pa., assignor of one-half to Marie V. Gehring, same place. Filed Nov. 26, 1900.

671,405. Telegraph. Harry Shoemaker, Philadelphia, Pa., assignor of one-half to Gustave P. Gehring, same place. Filed Jan. 12, 1901.

671,406-671,407. Wireless Telegraphy. Harry Shoemaker, Philadelphia, Pa., assignor of one-half to Marie V. Gehring, same place. Filed Jan. 17, 1901, Jan. 22, 1901.

671,420. Electrotherapeutic Spectacles. Alexander F. Humphrey, Allegheny, Pa. Filed Jan. 11, 1901.

COMMERCIAL PARAGRAPHS.

The Crocker-Wheeler Company, whose works are at Amper, N. J., report that the orders booked for the month of March exceed by a considerable percentage the largest manufacturing business the company has had at any time during its previous history. Among the more important contracts closed were the following: Philadelphia Engineering Works, 500 hp. in Crane motors. Witherbee, Sherman & Co., One Size 150 D, 150 kw. belted type generator, and 160 hp. in motors. General Electric Company (1900), Ltd., Glasgow, Scotland, One Size 150 D, 150 kw. belted type generator. Newport News Shipbuilding & Dry Dock Company, Two Size 15 D dynamotors; One Size 7½ Bipolar dynamotor; One Size 15 D dynamotor. The New United States Mint at Philadelphia, 19 motors aggregating 115 hp. Newton Street Railway Company, Newton, Mass., One Size 448 engine type, 400 kw. railway generator. The Guggenheim Smelting Works, Perth Amboy, N. J., Two Size 448 engine type, 520 kw. electrolytic generators. Alsen's American Portland Cement Company, West Camp, N. Y., Three Size 448 engine type, 400 kw. power generators, and One Size 168 engine type, 100 kw. lighting and power generator; also 43 motors aggregating 2,000 hp. Brandywine Traction Company, Brandywine, Pa., One Size 224 engine type, 200 kw. railway generator. John B. Stetson Company, Philadelphia, Pa., Two Size 336 engine type, 300 kw. lighting and power generators. Western Union Company, 36 machines for telegraphic work.

Attention is called to the advertisement on page iii of Mr. Oscar A. Michel, solicitor of American and foreign patents, 302 Broadway, New York City. Mr. Michel does not demand an advance fee for undertaking sales of patents for clients. He also offers to send a handsome nickel-plated match box, with much valuable information, to anyone desiring same.

THE TELEPHONE WORLD.

Telephone Company Trying to Reach New York.

Negotiations are on foot between Philadelphia capitalists operating telephone lines in Pennsylvania for the purchase of the Paterson, Passaic & Suburban Telephone Company of Passaic County. The parties control the local telephone companies in Trenton, Chester, Delaware, Easton, Allentown and Reading. They are desirous of getting into New York, and it is with the view of effecting this that they want to control the lines in Passaic County. An effort was made to get into New York by way of Newark and Jersey City, but the Bell Company succeeded in blocking them.

Messrs. Frank H. Knapp and C. R. Callaghan, of Bellevue, were in Cleveland, O., a short time ago, conferring with the officials of the United States Telephone Company, and have consummated a telephone deal of much magnitude. For several weeks past these gentlemen have been busy negotiating for the purchase and transfer of the Huron County Telephone Company, including their exchanges and good will. This company owns and operates exchanges at Monroeville, Chicago Junction and Plymouth, together with 10 miles of toll line. The Huron County Company will have a paid up capital of \$30,000. It will be reorganized, and Bellevue, Monroeville and Cleveland parties will be interested. This deal is one of the largest ever made in telephone property in Huron or Crawford Counties. The company will extend and enlarge its exchanges to greater capacity. It already has over 600 'phones in operation, and most excellent prospects for future growth. The capital stock has already been subscribed for except 50 shares, which sell for \$50 a share.

Nearly 300 telephone companies are doing business in Iowa, and this does not include a large number of private and farm lines which are in operation throughout the State. There are fully twice as many companies doing business in that State as last year when the assessment was made. The companies last year paid their taxes direct to the people, but this year they will pay to the various counties the same as the railroad companies.

A syndicate is being formed in O'Neill, Neb., to put in a telephone system for a local exchange and to connect with surrounding towns. For the first time in many years no interest is manifested in the city election. By common consent the city officers now in charge will hold over and the election will be but the formal ratification of the wishes of the people.

The United Telephone & Telegraph Company of Philadelphia has bought out and taken possession of the Independent Telephone Company and its plant in Lancaster. The price paid was \$120 a share and the total price \$210,000. The United Company recently acquired lines in a dozen other counties of Pennsylvania.

The Dirigo Telephone Company has obtained permission from the board of aldermen to do business in Portland, Me. For three years this company has been trying to get a foothold in that city, but its endeavor has heretofore been defeated by the New England Telephone Company.

W. D. Burford, local manager of the Cumberland Telephone & Telegraph Company at Owensboro, Ky., says that his company would spend about \$18,000 on the building recently purchased for an exchange, and on other improvements there this spring.

The Interstate Telephone Company recently held its annual meeting at La Crosse, Wis., and elected the following officers: President, James A. Tawney; vice president, John Dietze; secretary and treasurer, Otto Troost, Jr.

D. N. Tallman of Willmar has become the owner of the local telephone exchange in New Paynesville, Minn., the transfer from A. F. Knebel, who put in the exchange, having been completed.

The Central New York Telephone & Telegraph Company of Utica has increased its capital stock from \$8,000,000 to \$10,000,000. The company has a paid-in capital of \$800,000 and debts and liabilities of \$210,000.

A franchise has been granted the People's Telephone Company of Jackson and Detroit, Mich., which will give merchants needed direct communication with Detroit and Jackson.

The Union Telephone Company of Alma, Mich., has filed a notice of increase of capital stock from \$100,000 to \$150,000.

The People's Telephone Company of Newport, Tenn., is preparing to extend its line to Del Rio in that State.

Winnipeg Tires of the Bell Company.

The rates charged by the Bell Telephone Company for telephone service in Winnipeg, Man., viz., \$50 per year for business houses, and \$30 per year for private residences, are considered by the mayor to be exorbitant and he is taking action for the introduction of a cheaper system. While the mayor favors the establishment of a municipal system he has also entered into communication with the Home Telephone Company, which has systems at Buffalo, Niagara Falls and also in many of the New York State cities. The rates of this company are \$36 for business telephones and \$16 for those in private residences. Winnipeg has 1,487 telephones and the saving yearly at the reduced rates of the Home Company's system will be about \$30,000.

Eder H. Moulton, president of the Twin City Telephone Company of Minneapolis, Minn., the new corporation which grew out of the reorganization of the Mississippi Valley Company, has no fear that the railroads will not subscribe for the use of the company's 'phones in time. Mr. Moulton says that some of the roads are already using Twin City Company 'phones, and more will have them installed in the near future. As public servants the railroads must accommodate the people, no matter what influences might prompt them to favor one telephone company more than another. The independent company, Mr. Moulton says, will become dominant in the local field just as surely as the local newspaper must reign supreme in its own field. The complete domination of all small cities and towns by independent telephone companies sounds the death knell of great monopolistic companies such as have wrung extortionate rates from the public for the past twenty years. The days of such monopolies are over in the telephone business, owing largely to the expiration of the patents which controlled the situation for a long time.

The Peninsular Telephone Company of Tampa, Fla., has made application for a charter. The capital stock is placed at \$300,000, at \$100 a share. William G. Brorine, Jacob F. Brorine, Gay Huffman, James W. Barwick and James J. Lunsford are the incorporators, and compose the board of directors, which shall serve until the time for the regular election next December. This corporation will have the franchise for a telephone system which was granted to Brorine & Huffman by the council of Tampa. The company has placed the price of business telephones at \$2.75 a month, and residence 'phones at \$1.50, and several hundred subscribers have already been secured. The same company will erect systems in Lakeland, Bartow, Fort Meade, Plant City, Fort Myers, Arcadia and Palmetto at once, and they will all be connected.

Receiver James Murphy of the North Dakota Telephone & Electrical Company has decided to sell the telephone line at a private sale. The line is located in Foster and Wells Counties and connects Harvey, Fessenden, Carrington and other towns. Since the line has been in the hands of a receiver it has paid handsomely, so it is said. It is understood the Northwestern Telephone Company may buy. There will be other bidders, however.

The Jefferson & Warren Telephone Company directors met in Warren, O., a short time ago, and decided to extend its lines in the northern part of Trumbull County, and in Ashtabula County, reaching a number of places not yet supplied with telephone connections.

Mandeville, La., is soon to enjoy the benefits of a local and long distance telephone. The Bell Telephone Company has secured enough subscriptions for the local exchange, and, with the long distance already in operation, that town will soon be connected with the outside world by this modern convenience.

The Wilson & Tarboro Telephone Company has applied to the Secretary of State of North Carolina for an amendment to its charter, increasing its capital stock from \$10,000 to \$25,000. W. P. Mercer is president and J. C. Hales secretary.

I. W. Ramsey, a telephone promoter, was in Appling, Ga., recently, in the interest of the telephone, and it is said that there will soon be a line put up from Grovetown to Appling. This will be of great value to the latter place.

The Eastern Telephone & Telegraph Company has been granted a franchise to string wires and operate in Woodbury, Pa.

The new switchboard for the Athens, Tenn., exchange of the Cumberland Telephone Company is of the latest style, and has a capacity of 1,600 drops.

It seems that the long distance telephone is making some progress towards reaching Hot Springs, Va. The American Long Distance Telephone Company has secured permission to run its wires through Covington, and it is understood that it will reach Hot Springs. The fact that the Clifton Forge Telephone Company, which had an exclusive franchise in Covington, waived its rights to object to the concession, indicates that the Virginia Long Distance Phone Company is operating with the American Company. A long-distance 'phone, giving connection with the Eastern cities, will probably get a good deal of business from Hot Springs.

Col. J. H. Allen, of St. Louis, has been granted permission by the Bond County, Ill., supervisors to construct a telephone line in that county. He intends to connect by telephone the towns of Greenville, Smithboro, Woburn, Mulberry Grove, Pleasant Mound, Hookdale, Tamalco, Keysport, Beaver Creek, Dudleyville and other towns.

An amendment to the charter of the Memphis, Tenn., Telephone Company, was lately filed, increasing the capital stock from \$200,000 to \$400,000, and also providing for the manufacture of electric light and motive power material and the equipment of plants for such purposes.

The Mutual States Telephone Company of Cleveland, O., has constructed a model toll line through Leslie, Mich., and is furnishing excellent service. The exchange also connects with the McLaughlin & Ward Telephone Company of Jackson, and all other independent companies of Michigan.

It is stated that work will shortly be commenced on the Bedias extension of the telephone line from Navasota to Anderson, Tex., and it will be pushed to completion as quickly as possible.

The McMinnville, Tenn., Telephone Company sold the McMinnville Exchange plant and adjoining toll lines to the Cumberland Telephone Company a short time ago.

The Fayette Telephone Company of Lexington is making arrangements to construct a line to Waddy by way of Lawrenceburg, Ky.

A village telephone company has been organized at West Burke, Vt., with Henry Moulton as president, Perry Paster secretary and agent, and David Smith, treasurer.

An effort is on foot to organize a telephone company in Dover, Tenn. Subscriptions are being rapidly taken and it is thought the line will shortly be in operation.

TELEPHONE INCORPORATIONS.

The Maysville Telephone Company, Maysville, Ky. Capital stock, \$5,000.

The Grayson County Telephone Company, Sherman, Tex. Capital stock, \$150,000.

The Jackson County Home Telephone Company, Jackson, O. Capital stock, \$50,000.

The Hazelrigg Co-operative Telephone Company, Hazelrigg, Ind. Capital stock, \$500. The directorate is to consist of nine members.

The Sidney Home Telephone Company, Sidney, Ill. Capital stock, \$2,500. Incorporators: C. C. McElwee, H. M. Bentley and C. H. Plymire.

The Independent Telephone Company, Seattle, Wash. Capital stock, \$600,000. Incorporators: Sherwood Gillespie, E. W. Andrews and Edward S. Byrnes.

The Citizens' Mutual Telephone Company, Cambridge, Ill. Capital stock, \$2,500. Incorporators: William M. Smith, Clyde B. Taylor and John W. Nelson.

The Advance Electric & Telephone Company, Chicago, Ill. Capital stock, \$15,000. Incorporators: V. Horace Messenger, H. Henry Hansen and George A. Thompson.

The Taylorsville Telephone Company, Taylorsville, Ind. Capital stock, \$2,000. Directors: Seneca S. Drybread, Benjamin W. Chambers, Edward McSweeney and B. E. Everne.

The Liberty Independent Telephone Company, Liberty, Neb. Capital stock, \$5,000. Officers: President, George Sutter; vice president, C. D. Matthews; secretary, R. T. Moore; treasurer, G. L. Meissner.

The Bell County Telephone Company, Temple, Tex. Capital stock, \$120,000. Incorporators: James King Duffy, New York City; James S. Brailer, Wauseon, O.; Z. B. Campbell, San Antonio; C. N. Haskell, Ottawa, O.; J. B. Earle, J. E. Boynton, Waco; H. M. Dougherty, Columbus, O.

GENERAL ELECTRICAL NEWS.

Lighting.

Aberdeen, Wash.—The electric light company of this city contemplates putting in additional equipment, which will double its present capacity and involve an expenditure of about \$10,000.

Avon, Ill.—The Turner-Hudnot Company of Pekin, Ill., contemplates the erection of an electric light plant here.

Chattanooga, Tenn.—The plans and specifications for the county's electric lighting plant were completed recently by F. P. Sweet, the electrician, and have been turned over to the committee.

Columbus, O.—An ordinance was lately passed granting the Indianola Land & Power Company an electric light franchise.

Corning, Ia.—The electric light plant destroyed by fire recently with \$7,000 loss is to be rebuilt.

Covington, Ky.—The light committee of the council will recommend the erection of a city electric light plant.

Delta, Col.—The present board of trustees has passed an ordinance submitting the matter of issuing bonds for a municipal electric light plant to the vote of the taxpayers at the coming election.

Fordyce, Ark.—This town contemplates establishing an electric light plant. Address C. McKee.

Gloversville, N. Y.—John Begley, formerly of Cooperstown, is at the head of a newly organized electric light and power company here. The company's capitalization is \$40,000.

Hogansville, Ga.—The people here will soon vote to issue bonds for an electric light plant.

Howell, Mich.—The citizens have voted to bond the town for \$15,000 for a municipal electric light plant.

Knoxville, Tenn.—The Knoxville Electric Light & Power Company will install additional machines to be used for incandescent purposes.

Mackinac Island, Mich.—F. C. Andrews is interested in the Municipal Lighting & Water Company organized with \$100,000 capital stock to operate an electric light plant in this city.

Marion, Ind.—M. C. Mead & Co., operating one of the electric light plants of the city, will in the near future extend its service to South Marion.

Melbourne, Ia.—An electric light plant is being talked of here.

Millersburg, O.—The electric light plant at this place is to be enlarged and improved.

Nashua, Ia.—The citizens are agitating the electric light question.

Saybrook, Ill.—The citizens of this place are agitating the question of erecting an electric light plant.

Sheffield, Ala.—H. Habler has applied for a franchise for the construction of a \$75,000 electric light plant and waterworks.

Shepherdstown, W. Va.—The citizens of this place are taking active steps toward the establishment of an electric light plant.

Smithfield, Va.—Messrs. Chalmers and Gay expect to have an electric light plant in operation before the close of summer.

Snobomish, Wash.—The Snobomish electric light plant has been bought by E. S. Aldrich and O. Lewis, of Livingston, Mont. The plant is to be enlarged.

Sutton, Neb.—The people here are talking of erecting an electric light plant.

Tulsa, I. T.—The Crystal Ice Company of this place wants prices on an electric light outfit with everything complete for installing.

Watervleit, N. Y.—An electric light plant is to be erected here.

Wimshoro, S. C.—The citizens of this place are talking of electric lights.

Street Railways.

Augusta, Me.—A movement has been started to construct an electric street railway from this city to Togus. The enterprise as now talked up is to be financed and carried through by the Augusta, Hallowell & Gardiner Electric Railroad Company.

Batavia, N. Y.—A new electric road to be known as the Batavia, Albion & Lake Ontario Railway has been organized, with \$350,000 capital stock, by G. W. Aldridge and J. H. Gregory.

Buffalo, N. Y.—The Buffalo, East Otto & Cattaraugus Railway Company has been organized to build and operate a trolley line between this city and Cattaraugus.

Burgin, Ky.—Eastern capitalists have had representatives here looking over the ground and seeing what kind of terms they can effect with the proper parties in regard to the building of interurban electric lines.

Chicago.—A syndicate of Cleveland men, aided by a New York banking house and two Philadelphia institutions, has agreed to finance the Aurora, Wheaton & Chicago Railway, a trolley line 40 miles in length, from this city to Aurora. The road will be capitalized at \$3,000,000.

Cincinnati, O.—The Cincinnati, Lebanon & Dayton Traction Company has been incorporated with \$10,000 capital stock and the line will extend through Hamilton, Warren, Butler and Montgomery Counties.

Ellenville, N. Y.—The Ellenville & Kingston Railroad Company was lately incorporated with a capital of \$300,000, to operate a standard gauge road by steam or electrical power, 28 miles long, to connect with the Ellenville branch of the New York, Ontario & Western Railway Company, near this place, and run to the city of Kingston. The directors are Thomas H. Fowler, John B. Kerr, O. D. Ashley, C. Ladyard Blair, F. K. Culbert, C. L. Hoyt, A. S. Roe, Grant B. Schley and Thomas B. Childs of New York.

Elyria, O.—Elyria capitalists have organized a stock company and will build an electric car line between Janesville, Wis., and Rockford, Ill., passing through Beloit. The line will be 32 miles long.

Farmington, Mo.—The proposed electric railway from De Lassus to this place and Flat River will be built by a home company. P. Giessing is president and W. R. Lang, treasurer. The road will be 15 miles long and cost \$125,000.

Hoboken, N. J.—The directors of the Bergen Turnpike Company met at Jersey City last week and voted to accept the franchise offered by the towns of West Hoboken and Union Hill and the townships of North Bergen, Fairview and Ridgefield Park for the establishment of a new trolley road from this city to Hackensack, and also to borrow \$1,000,000 from the New Jersey Title Guarantee & Trust Company of Jersey City, for which a mortgage will be issued. The money will be used in building the road, and will be advanced by the trust company as needed.

Marysville, O.—R. W. Thompson of Peoria is interested in a new proposed electric road which is to connect Lima with Columbus via Westminster, West Newton, Roundhead, Lewistown, etc. This line is to intersect with the Union Electric line from Marysville on to Columbus.

Palmyra, N. Y.—Articles of incorporation for the Palmyra Electric Railway Company have been filed. The company purposes constructing and operating a street railway four and a half miles long through this village, with \$45,000 capital.

Port Chester, N. Y.—The New York & Port Chester Railroad Company, capitalized at \$250,000, was incorporated April 3 to operate an electric street surface road 25 miles long from the Harlem River at Port Morris through the Borough of the Bronx to Mount Vernon, Pelham Manor, New Rochelle, Larchmont, Orienta, Mamaroneck, Milton, Rye and this place to the Connecticut line, with a branch to Clason's Point, on the East River. The directors are: Charles Heinicke of Whitestone, M. F. Germond of Dumont, N. J.; W. H. Heath of Brooklyn, M. W. Baldwin, E. E. Mailloux, Mesmore Kendall, Christopher Kaiser, C. O. Mailloux of New York City, and Ernest Muller of Westfield, N. J.

Syracuse, N. Y.—Recent dispatches from this city gave credence to a rumor that capitalists are back of a gigantic enterprise having as its object the connection of Syracuse and Rochester by a trolley line.

Manufacturing.

Chicago.—The Dr. Alexander Medicine Company of this city has changed its name to the Electro-Chemical Storage Battery Company, and also its object to the manufacturing of electrical appliances.

New Castle, Pa.—The Keystone Foundry property has been purchased by a company which will soon begin the manufacture of brass electrical supplies and a patent electric burglar alarm matting. The stockholders are C. H. Johnson, Charles Matthews, John B. Brown, C. J. Kirk, W. S. Johnson, G. W. Hartman, E. S. Whiting, T. H. Hartman and Robert K. Aiken.

New York City.—The National Battery Company, capitalized at \$500,000, will manufacture electric batteries. W. B. Greeley, C. A. Wendell and R. S. Nichols hold an interest in the concern.

Trenton, N. J.—The Lorain Steel Motor Company, with a capital of \$600,000, was lately incorporated here to manufacture and deal in electrical machinery of all kinds. Alfred George Brown, Emery W. U-mair and Edwin F. Maguffin, all of East Orange, N. J., are those interested.

West Chester, Pa.—The indications of the Sun Electric Supply Company, a manufacturing concern, locating here are considered favorable.

Company Matters.

Albany, N. Y.—At the recent annual meeting of the Albany & Hudson Railway & Power Company, which operates the new third-rail electric road between this city and Hudson, the following were elected directors: Clinton L. Rossiter, Gov. Foster M. Voorhees of New Jersey, Henry Seibert, W. F. Sheehan, R. A. Smith, Seth L. Keeney of Brooklyn, A. M. Young of Bradford, Conn., James Purcell of Hudson, and H. G. Runkle of Plainfield, N. J.

Boston, Mass.—Judge Bond of the Superior Court has appointed James E. Leach receiver of the Anchor Electric Company.

Steubenville, O.—The Steubenville Traction & Light Company has increased its capital stock from \$500,000 to \$700,000.

Power and Transmission.

Baltimore, Md.—Representatives of the United Railways & Electric Company and of the Susquehanna Electric Power Company have conferred relative to the proposed transmission of the electric power to this city for use by the railway company. The Continental Trust Company is to finance the scheme if it be accepted.

Binghamton, N. Y.—A large project is on foot to harness the power of the Susquehanna River, and to utilize the energy which is now wasted in providing power for manufactories and plants in this city, Lester Shire and the neighboring country. The project has progressed sufficiently so that now the fulfillment of the plan is assured.

Mines.

Colorado Springs, Col.—George Andrews is installing two electric hoists on the Xenia claim on Tenderfoot hill.—The Colorado Electric Power Company has closed a contract with the Occidental Development Company to install a 5 horse power hoist on the X-10-U-8 claim on Squaw Mountain. The same company will install for F. J. Clark a 15 horse power hoist on the Dexter claim.

Automobiles.

Kenton, O.—G. J. Miller has received letters from his attorneys saying that his applications for patents upon methods of making electrodes for storage and other batteries for automobiles, and for apparatus for making electrodes, have been granted.

Warren, O.—It is reported that the Ohio Automobile Company has booked one order for \$40,000 worth of automobiles. The capacity of the plant is being increased.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by ELECTRICITY from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

* Unlisted. † Ex div.

a The United Railways & Electric Company comprises in its organization the Baltimore Consolidated Railway Company, the Baltimore City Passenger Railway Company, all the lines of street railway operated by these companies, and also the Central Railway Co. of Baltimore. The pref. stock of U. R. & E. Co. has been issued in the form of income bonds.

b Leased to Boston Elevated Railroad Company.

c Owned by Brooklyn Rapid Transit Company.

d Leased to Brooklyn Heights Railroad Co., which guarantees 10% on capital stock.

e Stock owned by Brooklyn Rapid Transit Company; road operated by Brooklyn Mts. Co.

f Stock owned by Kings County Traction Company; road leased to Nassau Electric RR.

g Owned by Atlantic Ave. RR. and leased to Nassau system.

h \$30 per share on outstanding capital paid as rental by leasee—West Chicago St. RR. Co.; \$250.00 of stock owned by North Chicago Street Railroad Company.

i Controls by lease Chicago West Division Railway, Chicago Passenger Railway, and West Chicago Street Railroad Tunnel Company.

j 35 % per annum paid on outstanding capital as rental by leasee—North Chicago Street Railroad Company; \$625,000 of stock owned by West Chicago Street Railroad Company.

k Majority of stock owned by Chicago West Division Railway Company; 5 % on \$1,000,000 stock guaranteed by West Chicago Street Railway Company, leasee.

l Cincinnati St. Railway purchased the Mt. A. & Eden Park road, assuming its bonds.

* Unlisted. † Full paid. ‡ Outstanding. § Ex-div.

a Leased to New Orleans Traction Company at 6 % on stock.

b Leased to New Orleans Traction Company at 8 % on stock.

c Leased to Central Croton Railroad at 8 % on stock and interest on bonds.

d Operating the former Met. Trac. system, that corporation having become extinct.

e Leased to 23d Street Ry. for 99 years; lease assigned to Metropolitan Street Ry.

f Leased to Houston, West Street & Poyonia Ferry—now Metropolitan Street Railway.

g Leased to Metropolitan Street Ry. at 8 % on stock until Oct. 1, 1897; thereafter 9 %.

h Leased to Metropolitan Street Ry. for 99 years from Jan. 1, 1893, at \$215,000 per annum.

i Leased to Metropolitan Street Railway for 18 % on stock.

j Leased to Met. St. Ry. for 99 years from April 24, 1892; 6 % first 5 years, 8 % thereafter.

k Leased to Metropolitan Street Railway for \$145,000 per annum.

l Leased to Metropolitan Street Railway for 18 % on capital stock.

m Controlled by Third Avenue Railroad by purchase.

n Dividends of 1 1/2 % yearly guaranteed by Consolidated Traction Company.

o Controls by lease the Allegheny, Cent., Citizens' Duquesne, Fort Pitt & Pitt's Traction.

p Leased to Consolidated Traction Company for 8 % per annum on par value of stock.

q Leased to Fort Pitt Traction Company for 6 % on \$3,000,000 capital stock.

r Leased to Consolidated Traction Company for 4 % on capital stock.

s Leased to Consolidated Traction Company for 7 % on capital stock.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16½@16¾c.; Lake, 16½@16¾c.; casting, 16½@16¾c.

The annual meeting of General Electric stockholders will be held in Schenectady, N. Y., May 14.

The stockholders of the Illinois Electric Vehicle Transportation Company have voted in favor of going out of business.

The Knickerbocker Trust Company of New York wishes to buy American Electric Telephone Company 6 per cent. debentures.

The Farmers' Loan and Trust Company of New York wishes to buy \$21,000 Helena Water and Electric Power Company first mortgage bonds.

The Scranton and Wilkes-Barre Rapid Transit Company have awarded a contract of \$1,155,000 to the Westinghouse Company for the electrical equipment of the road.

The report of the United Traction Company of Albany, N. Y., for four weeks ending March 28 shows receipts of \$99,534.91, as compared with \$95,912.76 for the same period last year, a gain of \$3,622.14.

The American Home Telephone Company, capital, \$2,000,000, was incorporated at Trenton, N. J., on the 5th inst. The incorporators are Alfred George Brown, Edward T. Hawkins and Edward T. Magoffin.

A syndicate of Baltimoreans has purchased the San Francisco and San Mateo Electric Railway of San Francisco, for \$1,600,000. The road runs through a rich fruit producing country. It is the purpose to extend the road to San Jose.

The following are quotations for some of the industrial stocks not quoted elsewhere: Electrical Lead Reduction, 4¼@5; Electric Boat, 22@22½; Electric Vehicle, 10¼@13; Tel. & Tel. Company of America (full paid) 6¼@6½; Electric Company of America, 8¼@8½.

The Telegraph, Telephone and Cable Company of America on April 2 filed papers with the Secretary of State at Trenton, N. J., reducing its authorized capital stock from \$30,000,000 to \$9,000,000. This was done by reducing the par value of its shares from \$50 to \$15.

According to a dispatch from Baltimore efforts are being made to construct a continuous trolley system from New York to Washington by the way of Philadelphia, Wilmington and Baltimore. Financial interests in Cleveland have offered to subscribe \$1,500,000 toward the project.

The consolidation of the principal lighting and heat interests in Montreal was accomplished on the 4th inst., when the Montreal Light, Heat and Power Company was organized with a capital of \$17,000,000. The company will absorb the Montreal Gas Company, the Royal Electric Company and the Chambly Manufacturing Company.

N. W. Harris & Co., of New York, Chicago and Boston offer \$400,000 first mortgage 5 per cent. gold bonds of the Dayton Electric Light Company, of Dayton, O., redeemable at 107½ and interest after March 1, 1906. They are issued to refund an old issue of 6 per cents and are part of an issue of \$500,000, secured by first lien on the entire property.

The annual report of the General Electric Company will be issued in a few days. It is believed that the net profits will not reach \$7,000,000, or quite 30 per cent. upon the present outstanding capital stock. All but about \$1,000,000 bonds have been converted into stock. When these have been converted the total capital will be \$25,000,000, of which a little more than \$2,000,000 will be preferred.

The failure of the New England Electric Vehicle and Transportation Company to operate profitably falls most heavily upon New York parties, as two-thirds of the 223,498 shares of stock outstanding are held in New York, says the Boston "News Bureau." There are about 450 stockholders. A majority of the stock has agreed to liquidate, although it will take a two-thirds vote of the stockholders to proceed with the plans for liquidation. The stock is selling in New York at 2¼@2½, although the cash on hand and real estate at cost price to the company figure a liquidating value of \$3.54 per share and it is believed that the company will return stockholders nearly \$5 per share in final liquidation.

The combination of all the big lighting companies of Cincinnati is now assured, as the directors of the various companies have formally accepted the terms submitted from the North American Company through the board of arbitrators. The companies entering into the combine and the percentages allotted them by the arbitrators are as follows: Per cent.—The Cincinnati Gas Light and Coke Company, 68.80; the Cincinnati Edison Electric Company, 27.65; the Jones Bros. Electric Company, 3.29; the Brush Electric Light Company, .05; the First Cincinnati Edison Electric Company, .30; total 100. In monetary value the amounts are: Cincinnati Gas Company, \$19,264,000; Cincinnati Edison Company, \$7,742,000; Jones Bros. Company, \$896,000; Brush Electric Company, \$14,000; First Cincinnati Edison Company, \$84,000; total, \$28,000,000.

Another big consolidation is about to be launched under the name of the American Light and Traction Company. Its scope is similar to that of the United States Steel Corporation, and its financial plan is almost identical with that company; but in the present instance the gas and traction enterprises, with which Emerson McMillan, of New York, is connected, will be merged into one corporation. It is expected that when the consolidation is completed there will be at least twenty gas, electric light and traction companies combined, with a capitalization of \$50,000,000. The charter of the new company was taken out in New Jersey Saturday, with a nominal capital stock of \$2,000. Like the United States Steel Corporation this amount is merely for the purpose of getting the scheme into a corporate shape, and the capital figures will be increased from time to time until the amount is sufficient to take in all the companies to which the offer of consolidation is made.

ELECTRICITY.

EDITORIAL NOTES.

The General Electric Company's Report.

The advance sheets of the
General Electric Company's
ninth annual report for the
year ended January 31,
have been given out. Ac-
cording to the figures there
was a profit of \$6,243,792,
and a net balance of \$4,275,502 after deducting
all dividends. The orders received during
the year aggregated \$27,969,541, against
\$26,323,626 the previous year, and \$11,170,319 in
the year ended January 31, 1897. As has here-
tofore been our custom, we shall publish the
report in full in an early issue of *ELECTRIC-
ITY*.

* * *

Stray Trolley Currents and Brooklyn Water Mains.

The destruction of
water and gas pipes
by electrolysis is
troubling municipal
officials in every part
of the country. Wherever the overhead trol-
ley is to be found in a thickly settled commu-
nity, defective pipes sooner or later invariably
make their appearance. As might readily
have been foreseen Brooklyn is the city to
whose underground metal structures the great-
est damage is threatened, and in view of the
numerous overhead trolley systems in that
community the only wonder is that the water
and gas mains have not been destroyed long
ago. Deputy Commissioner Kirwin of the
Department of Public Buildings, Lighting and
Supplies has been giving the matter his atten-
tion, and has drawn Commissioner Kearny's
attention to the existing state of affairs. In
his communication to Commissioner Kearny,
Deputy Commissioner Kirwin says, in part, as
follows:

"That this borough's gas pipes, water pipes,
Edison tubes, cable armors, etc., are experi-
encing rapid decay through the ravages of
electricity cannot be denied; nor is it a hard
matter to demonstrate that the beginnings of
electrolytic trouble were coincident with the
adoption of the single trolley system in this
borough. As far back as 1893 the Board of
Commissioners of Electrical Subways became
cognizant of the evil and instituted an elec-
trical survey of the City of Brooklyn. A resur-
vey was undertaken in 1896 by the board. The
solution of the problem is a matter of no small
moment.

"The importance of the subject cannot be
overestimated. The impediment to efficient
fire protection caused by leaky mains, to say
nothing of inconvenience and expense due
to failing gas, water, telephone and electric
light service, is enough to demand an investi-
gation of the most thorough nature. Indeed,
the rapid failure of some of our recently laid
asphalt pavements is charged against gas leaks,
for which the gas companies are endeavoring
to hold electrolysis responsible.

"Brooklyn, it appears, is not the only victim
of this evil. Throughout the country the same
troubles seem to have been met with. The
consulting engineer of lighting and electricity
should be requested to prepare a preliminary
report, outlining the plan to be employed in
properly investigating the subject, and this de-
partment should be authorized to designate
the head of its Bureau of Electricity and Gas
to assist in the preparation of said report."

In a city such as Brooklyn, where are to be
found miles upon miles of overhead trolley
lines, the problem of preventing current from
straying from its rightful path will prove a
most difficult one to solve. Thorough bonding
of the rails will no doubt tend to remedy the
evil, but it is very questionable whether it
would obviate it entirely. The truth of the
matter is that a city such as Brooklyn should
have the conduit system as is to be found in
New York, but of course it would be out of
the question to undertake to compel the Brook-
lyn Rapid Transit Company to do away with
its present system and substitute the under-
ground conduit, as the expense would be enor-
mous. As this method of procedure is there-
fore out of the question—at least for some
time to come—it only remains for the authori-
ties to insist on the usual precautions and
adopt the remedies that have proven fairly
satisfactory in other localities under similar
trying conditions.

* * *

An Object Lesson in Government Ownership.

Persons who advocate
Government ownership
in this country of the
telegraph and telephone
would do well to examine
carefully into the condi-
tions of these enterprises in Great Britain.
The State purchased the telegraph systems in
England over thirty years ago from half a dozen
competing private companies and eleven years
elapsed before the rates were reduced for the
ordinary citizen. The act of Parliament

authorizing the purchase and providing the necessary funds for the purchase of the systems also gave the British Government a monopoly of electrical communication and placed the administration of the telegraphs in the hands of the Post Office. When the telephone was introduced into that country it was fiercely attacked by the Post Office authorities in the belief that it would supersede the telegraphs. Ultimately, after costly law suits, the courts decided that the telephone came within the terms of the act of Parliament and could not therefore be used in England without the consent and authorization of the Postmaster-General. Referring to the subject a correspondent of the N. Y. "Sun" says:

"The postal men who controlled the telegraph had neither the courage nor the foresight to buy up the American patents, lock, stock and barrel, and go into the telephone business themselves. They therefore issued licenses to private corporations and hedged them around with such manifold restrictions that enterprise was crushed and the telephone system of this United Kingdom became a by-word among the nations. Six years ago the Post Office Rip Van Winkles awoke from their slumbers and again appealed to Parliament to help them. Parliament dutifully passed an act by means of which the Post Office people received funds with which to buy the trunk lines of private corporations, who thenceforward were to be restricted to local exchange business, an arrangement which suited them very well indeed. They obtained for their trunk lines a price about three times their intrinsic value, and they cheerfully accepted the profitable local traffic and gave the Post Office the unprofitable trunk line work. Three years later the Rip Van Winkles again rubbed their eyes and after looking around saw things which displeased them. They asked and obtained Parliamentary powers and funds with which to compete actively with the private corporations, or rather with the one corporation—the National Telephone Company—which had survived the stress of unfair Government interference. As might have been expected, the result of all this muddling, vacillation and inaptitude is that England has the worst telephone system in the whole world. The telephone has not even yet entered into the daily business life of the British people; it is still a luxury, and bids fair to remain so for long years to come."

The writer of the article states that while the Post Office bureaucrats were thus engaged in the congenial occupation of strangling private enterprise in the telephone business and, incidentally, in the district messenger and tape ticker businesses, they allowed their own telegraph business to go to the dogs.

The correspondent continues as follows:

"In 1896 it became evident that a retrograde policy had been deliberately decided upon and enforced, but it was not until three years later that proof was given to the world by the "Telegraph Chronicle," the organ of the telegraphers of the United Kingdom. By some means, which a special departmental committee failed to discover, this enterprising paper obtained and published the confidential report of a secret commission which was appointed in 1895 for the purpose of ascertaining how money could be saved in the administration of the telegraphs. The commission deliberately reported in favor of economy before efficiency. Controlling officers were warned

that money must be saved at all costs, and departmental protection was promised in the event, certain of course to happen, of increased delay in transmission consequent upon the saving of pence. They were urged to give scant consideration to newspaper dispatches, and the golden rule laid down for their guidance was that a minimum staff should be kept for maximum requirements.

"Needless to say the telegraph service was utterly demoralized by these recommendations. Errors and delays became the rule instead of the exception. To-day it is nothing unusual for a press dispatch of less than a hundred words to occupy three to four hours in transmission, say, from London to Dublin, private messages of twelve words very rarely obtain delivery within an hour of handing in, and in London it takes twice as long to send a message from one part of the city to another, a few miles, than it does to telegraph 500 miles to the north of Scotland."

The author concludes in the followings*rain:

"There are few thoughtful men in this country now who do not deplore the existence of the Government monopoly in telegraphic and electrical matters. That monopoly has not only given the country an inferior telegraph service and a disgraceful telephone service—it has strangled many promising enterprises and has driven British talent into seeking foreign outlets, with the result that if an electric outfit is required here for railroad or tramway or what not it has to be obtained almost invariably in the United States. Such are the fruits of Government monopoly and incompetent administration."

The above matter should furnish advocates of Government and municipal ownership with food for thought, and it is to be hoped that the conditions that existed for years in England as regards the telegraph and telephone, will deter Congress from advocating Government ownership of a Philippine cable when one has been laid.

* * *

Roentgen Rays as a Cure for Cancer.

We have referred in these columns several times to various alleged electrical inventions, or more properly speaking, discoveries as a cure for cancer. Some two years ago a Philadelphia physician was credited with having discovered a method of curing this dreaded disease by inserting in the body of a patient nascent salts of mercury by electric diffusion. Whether this method of treating cancer has turned out as efficacious as was hoped by its originator, we are not prepared to say, but word now comes from California that the disease may be cured through the medium of X-rays.

The physician who claims to be able to accomplish this by means of Prof. Roentgen's discovery is a resident of Oakland, and has been experimenting along these lines for several years. He first tried the effect of the X-ray on himself, and succeeded, so the report states, in curing a cancerous growth. Later he treated others with remarkable success. Referring to his method and system he says:

"When the X-ray was discovered, I was merely interested from a purely scientific standpoint. I secured a machine, and after placing a lead mask over my face, entirely covering it where I was afflicted, I began systematic treatment, I found relief from the beginning. Now I am thoroughly cured,

"My theory is that the X-ray kills the molecules which constitute the primal cells, where cancerous life actually begins. It frequently takes thousands of these molecules to make a single cell of the tissue. The deterioration or decay of the molecules, I judge, may cause cancer. It probably does.

"The X-ray has the effect of drying up these atoms, and in time prevents the spread of cancer. Ultimately it kills the disease. I am positive when I say the X-ray can cure cancer."

Although, as previously stated, several electrical methods have been suggested in the past as a cure for cancer, none to our knowledge has proven entirely satisfactory, and such being the case, if the California physician can accomplish what he claims, his experiments will be watched with interest by the medical and scientific world.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

It is stated that a chainless automobile is one of the latest inventions in the motor world.

THE Electrical Machinists and Instrument Makers' Union, which is a branch of the International Association of Machinists, held a meeting recently in Arlington Hall, New York, and decided to join the nine-hour demand of the machinists, which goes into effect on May 20. Both the union and non-union men will make the demand.

THE Electric Vehicle Company has recently been awarded the contract for carrying the mails between the Pan-American Exposition grounds and the Buffalo Post Office. The vehicle has a carrying capacity of 1,000 pounds besides the driver and attendant and will be required to cover 60 miles a day.

RAILS for the extension of the electric lines of Glasgow are to be furnished by American manufacturers, according to cable advices received in this city last week. About 3,450 tons of rails will be required, at a cost of \$110,000. Nearly all of the original equipment of the Glasgow lines also came from the United States.

THE Compania de Ferrocarriles del Distrito Federal de Mexico (The City of Mexico Tramways Company), which concern operates the first electric traction system in that part of the world, is now placing a large number of contracts for American material, equipment, etc., rendered necessary by an extension to the road. Though the company has been solely financed by London bankers, practically everything in the shape of equipment has been purchased in this country. It is estimated that fully \$2,000,000 has been expended in the United States. A St. Louis concern is to execute a contract for the building of twenty trolley-cars, which are to be elaborately fitted with the most up-to-date improvements, and will cost \$6,000 a piece.

A COMBINED fire engine and hose-cart was recently patented, the engine of which is operated by an electric current, whereby the necessity of the steam boiler and fuel supply is dispensed with. As the motive power is electricity, the only apparatus required for

power is a small electric motor, which is located beneath the body of the vehicle, whereby the body of the vehicle may be used for the hose pipe. The motor is connected with the trolley wires of the street car lines, branch wires being run from such street car lines to the various parts of the city where hydrants are located. By this arrangement a comparatively light vehicle may be used, and the power is applied the instant the wires are connected.

OUR London namesake states that electricity is reported to have proven an effective remedy for frost-bite. Circulation is set up and continues for a considerable time after current has been passed between poles applied to opposite sides of the affected member, but several applications may be necessary to complete the restorative process.

A DISPATCH from Alliance, O., states that a messenger boy for the Postal Telegraph Company in that city has invented an apparatus which can be attached to the telegraph key and will act as a caller. It works automatically and when placed against the instrument will call another office, signing call regularly.

A FIVE story automobile depot is to be built in Boston. When completed it will be a finely equipped building with 5,500 square feet of space on each floor, and every convenience for the accommodation of patrons—ladies' waiting room, reading and lounging rooms, baths, etc.—will be provided. The second and third floors will be divided into offices for manufacturers' agents, and an effort will be made to rent club suites on the upper floors and provide storage for members' machines.

THE Baudot Multiplex Type-Printing Telegraph, a French invention, is doing the whole telegraph business between Berlin and Paris, which heretofore required five telegraph lines, easily over one wire. Consul-General Guenther, of Frankfurt, says that the operation is perfect, and uninfluenced by minor interruptions of the conduit. The work for the operators is not more arduous than with the Hughes apparatus. The new system is not suitable, however, to long cables. "The new successes in quick and multiplex telegraphy will create a peculiar situation for the administration of the telegraphic service," says Mr. Guenther. "If the Baudot system be introduced all over Germany and in addition if the quick telegraph of Pollak and Virag be utilized for newspaper telegrams, and if Prof. Slaby succeeds in applying his discoveries concerning multiplex spark telegraphy to ordinary wires, then it will be only a question of a short time when the existing telegraph business will hardly keep all the lines busy."

AN electric trolley line is being built to connect Chamouni at the foot of Mont Blanc with Geneva, which will enable persons traveling in Europe this summer to reach the beautiful mountain region at a moderate cost, doing away with the expensive luxury of a carriage. Reporting upon this matter to the State Department, Consul Washington, at Geneva, says: "The line has been built at great expense by the Paris, Lyons, and Mediterranean Company from Fayet-St. Gervais, a station two hours by rail from Geneva and a trifle longer from Aix-les-Bains. During the

summer season it is intended to operate six trains daily between Geneva and Chamouni, the time of the run being, according to train, three and one-half to four hours. The line is expected to be in operation by June or July at the latest.

MR. WALTER H. CHAMBERLIN, of Chicago, on Friday tendered his resignation as United States Assistant Commissioner of Patents.

ADVICES from London state that the British Post Office is purchasing a large amount of telephone apparatus from concerns in the United States, one company alone having recently received an order for \$500,000 worth of appliances.

THE United States Civil Service Commission will hold examinations on May 7 and 8 in the Post Office Building, Albany, N. Y. Among the other positions is that of inspector of mechanical and electrical engineering. Information in regard to the subjects for examination may be had from W. J. Guernsey, superintendent of railway mail service.

THE New York Electrical Society will hold its next meeting at Havemeyer Hall, Columbia University, Thursday, April 25, when Mr. C. F. Scott, chief electrician of the Westinghouse Electric and Manufacturing Company, will lecture on "Alternating Current Motors."

THE "Figaro" of Paris states that the Metropolitan Railway has beaten the world's record for the number of passengers carried on any line. From January 1 to March 31 it transported 11,315,799 persons, which at the same rate for a year would give a total of 32,000,000, an average of 4,000,000 per kilometer. It carried on Easter Sunday 182,216 passengers, which number was double the biggest day's total during the Exposition.

THE latest great application of natural force to a useful purpose, in which it is announced that Nikola Tesla is especially interested, is an electrical process for purifying water, says the Baltimore "Herald." The system contemplates, it must be understood, not the shaking of a few millions of unhealthy microbes out of a few gallons of water. Mr. Tesla deals in no such small schemes as that. The plan, when made to work, will be expected to purify the inflow of the open rivers that contribute to the supply of large cities. Instead of swallowing with every glassful of the murky beverage which flows from the faucet a large percentage of odorous protoplasmic germs, the electrified water of Mr. Tesla may be expected to possess the sparkle and sweetness of the aqueous fluid that flows from the mountain rocks. He could confer no greater boon upon humanity. Let us hope this time for practical results.

So many rumors have been current in England respecting the formation of a syndicate in connection with Edison, to work his new ore milling process in order to enable European manufacturers to compete with the United States Steel Company, that the chairman of the syndicate, Mr. J. Lawrence of London, has made public the facts relative to its objects. He says: "The Edison Ore Milling Syndicate consists of 55 gentlemen connected with the iron, steel, machinery, engineering, mining

and banking interests of England. A number of these gentlemen became interested about three years ago in Edison's plan of crushing and treating low grade ores upon which he has expended about \$2,500,000. Satisfied that a prima facie case had been made out in favor of the process, a process which, if one-half that Edison claimed for it was realizable, an industrial revolution of far reaching importance would follow, 33 gentlemen subscribed funds to further investigate the invention, and at the same time search was made for ore deposits workable under the new process. The result of all this has been the formation of the syndicate in question and its control of vast deposits of low grade iron ore in Norway. We are now enabled to produce from two tons of the low grade ore, one ton of high grade Bessemer ore averaging 65 per cent. of metallic iron. We have proved on a portion of this property the existence of 80,000,000 tons of ore with the prospect that other parts of the property may turn out proportionately good. It is our intention at present to erect works and ship the ore exclusively to British iron masters. There is now a promise of a supply of high grade Bessemer ore adequate to the needs of Great Britain for years to come."

WHEN an induction motor is started a resistance is inserted in the rotor and gradually switched out as the motor gains speed, the rotor being finally short-circuited at full speed. The idea of performing the short-circuiting automatically, says the "Elektrotechnische Rundschau," has been put into effect by the Allgemeine Elektrizitäts Gesellschaft by means of a switch fixed on the motor shaft and actuated by centrifugal force.

THE Metropolitan Street Railway Company has removed the compressed air cars from its cross town lines and has gone back to animal power. It is to be hoped this is the last of the air cars. Finis coronat opus.

A DISPATCH has been received by Gen. Greely, chief signal officer, from Col. Allen, saying that the cable ship Burnside has returned to Manila. She has been in the southern islands for several months laying cables to connect the islands of that portion of the archipelago. The Burnside will receive the supply of cable that has been sent to Manila and will again go south to continue the cable laying.

THE Stanley Electric Manufacturing Company of Pittsfield, Mass., will make a large exhibit at the Pan-American Exposition at Buffalo, consisting of generators, switchboard apparatus, instruments, transformers, etc. The whole value of the outfit will be about \$50,000. The most notable exhibit will be a 1,300 hp. generator valued at about \$15,000.

EXPERIMENTS are still being made in Boston Harbor with Prof. Elisha Gray's invention for signaling under water, which was described in the issue of ELECTRICITY of January 16, 1901. The first practical application of the system will it is understood be made at the mouth of the St. Lawrence River where a bell will be attached to a buoy which will inform vessels equipped with the necessary receiving apparatus of their whereabouts.

"Electricity's" Educational Series.

BY R. MAX EATON.

ARTICLE NO. 23.

THE TELEPHONE AND TELEPHONE PRACTICE.

(Continued.)

The attention of the telephone engineers at present is taken up with common battery or, what is often called, centralized energy systems. In the previous articles on telephony we described instruments and apparatus which depended for their operation on a local battery at each instrument and familiarly known as the general system. Although the general system is yet extensively used, very little attention is being given to improvement in that line, for on account of the advantages of the common battery method practically all the engineers have applied their attention to it, and as a result great strides are being made in the development and improvement of it.

By the operation of a telephone system with its source of energy located at one central point great advantages are derived; for instance, the expense of maintenance is reduced, and there must necessarily be an equalization of efficiency in transmission and the apparatus required at the sub-stations may be much simpler and more effective besides requiring less mechanism and therefore less disorder.

FIG. 1.

The first attempt in the operation of telephones with a battery supply at the central station was by placing a set of batteries in series with each of the operating cord circuits. This circuit (Fig. 1) was a result of some of the first experiments. A low resistance receiver, and also the granular carbon transmitter of the general system type, with slight changes, was used. The result was far from being satisfactory, however, and a flat and unnatural sound was produced, far from the perfect transmission then secured by the induction coil and local battery. You will notice the principle, which is simply a variation in the resistance of the entire circuit by the action of the transmitters, consequently causing a variation in the amount of flow of current which results in a wavy disturbance in the current corresponding to the sound waves acting on the transmitters.

The next circuit put to the test of practical use was where one set of batteries was used for all cord circuits, and instead of having the batteries in series with the cord circuits they were bridged across and connected to the circuit through retardation coils (see Fig. 2). The principle of operation was simply that a variation in the resistance of one circuit caused a corresponding change in the rate of flow in the other, and through the fact that current was fed to the lines through retardation coils the disturbance was effective regardless of the resistance of the common part of the circuits. Although in operation this was a vast improvement on the first circuit, yet it

was found that without the action of the induction coil being brought into play the transmission could by no means be brought to the perfection secured in the most improved type of local battery "phone." This circuit gave by no means poor results, however, and several large exchanges were built and successfully operated involving this principle, in fact, a number of good operating systems in use today operate on this principle with the aid of slightly improved instruments.

FIG. 2.

The instrument for use on common battery circuits did not remain untouched, and much changing went on with it as with the circuits and central office arrangements. The first instrument used was simply the receiver and transmitter in series with the line. It was soon found that by the use of an induction coil in the instrument much clearer tones could be secured. The evolution of the instrument is shown in Fig. 3, C being the circuit of the latest type of set.

A.

B.

C.

FIG. 3.

One great disadvantage of using a retardation coil and battery bridged, as in Fig. 2, was that if two lines were connected together, one short and one long, the short line would receive most of the current and the current in the long one would be proportionately diminished.

The next step was to provide so that the current in each circuit would be independent of all other circuits, and to accomplish this a repeating coil was used and arranged as described in Fig. 4. This sketch shows the common battery circuit now used by the Bell Telephone Company. Of course this is the plain circuit with all operating devices and apparatus left out. The common part of all circuits is the batteries and necessary connections including bus-bars, etc. This common part must have practically no resistance. If this were not the case "cross-talk" would exist between the circuits. On account of this storage batteries are almost entirely used, in fact they are necessary in large exchanges anyway where considerable current is required.

Fig. 5 describes a very popular system used extensively by what are known as independent companies. The principle is practically the same as that described by Fig. 3 except two sets of batteries are used and the circuits are not united except by the use of condensers. This overcomes the objection of a short line taking most of the current when connected to a long one, as would occur in the circuit described by Fig. 2. In this system the retarda-

tion coils are replaced by relays of high impedance which perform the same function and also act as operating signal devices.

FIG. 4.

The circuits just described are the plain circuits without showing any of the connections, signals and apparatus, essential to their operation in central systems.

The massing of an immense number of subscribers into a central exchange and the providing of a means for successfully and rapidly making any desired connection presents the greatest problem to the engineer, and just at present the operation involves such a tremendous and intricate amount of apparatus that the tendency is very much toward the perfection of it at the sacrifice of efficiency in transmission of sound.

We might hint to the student of an inventive turn of mind, that there is a big field for invention and improvement in the central office systems and a central exchange of large

capacity which will provide simple, effective and rapid means for the interchanging of con-

FIG. 5.

nections and still maintain a talking efficiency equal to a direct "un-relayed" and "un-repeated" circuit will fill a great requirement in the telephone field.

Article No. 24 will be entitled "The Telephone and Telephone Practice" (continued).

A Specially-Designed Searchlight for River Navigation.

An English firm has just completed a specially designed electric searchlight, which is about to be shipped to India for use in river navigation at night. The carbons, instead of being vertical are horizontal, and work automatically. It is, however, the facility with which the projector can be moved about that is the chief feature. There are two motors in the base of the instrument, and these, controlled by a special switch, cause the lamp to follow the motions of the hand in all directions in a vertical or horizontal plane.

THE PROPOSED HIGH-SPEED ELECTRICAL "MONO-RAIL" BETWEEN LIVERPOOL AND MANCHESTER.*

BY F. R. BEHR.

Whilst anxious to give you some new and interesting details on the Manchester and Liverpool Electric Express Railway, I approach the subject with great diffidence. There has been so much written and said in connection with this project, that I am afraid you are all familiar with its principal features.

The principle of the mono-rail which it is proposed to use in the construction of this railway is not a new one.

The special form of the mono-rail I have adopted was originally thought of by Mr. Charles Lartigue, a French engineer, who so far applied the idea practically as to construct some primitive and simple lines in Algeria and Tunis in 1883 and 1884 for carrying esparto grass and similar produce, the tractive power being animal in all cases.

As electric traction became more perfected from year to year, I was impressed about the end of 1892 with the fact that an even more important application of this principle was to be found in the construction of high speed railways, to overcome the great and increasing difficulties of managing the various kinds of traffic on the existing railways by removing the express passenger traffic on to new rails.

The absolute impossibility to derail on this system, if properly designed, when going at very high speeds through comparatively sharp curves is its principal recommendation for high speed, as it results in absolute safety and economy in construction. The cost of the mono-rail for average speeds of at least 100 miles an hour would be about the same, or slightly less than the cost of an ordinary two-rail railway constructed for maximum speeds of 60 miles an hour. There is no doubt that ordinary railways could be constructed to work at speeds of 100 miles an hour, if worked electrically, but the additional expense beyond that which is at present necessary would be very great indeed for many reasons, of which the two principal are, the necessity of consolidating the relative position of the two rails in such a way that they would practically form only one, and the impossibility of using curves of a smaller radius than about 3,000 yards, which practically amounts to a straight line, and even with all these precautions the safety obtained could never become so absolute on such lines as it would be on the mono-rail. For instance, one of the principal causes of derailment on an ordinary railway is bad ballasting or packing of sleepers, which results often from heavy rain, floods, or even neglect. The sinking of two consecutive sleepers ever so little in opposite directions must derail the engine on an ordinary line. On the mono-rail such an accident would produce no appreciable effect on the position of the driving wheels and of the carriage as the surface of the top-rail affected thereby is only 2 inches wide, and would therefore produce such a small twist that it would practically not be observable.

There are many causes which contribute to this absolute safety which can only be understood by carefully examining the detailed construction of the carriage as it fits to the permanent way, when it will be observed

amongst other reasons that whereas an ordinary railway carriage is held on the rails by a flange of about $\frac{1}{4}$ th of an inch in depth, the arrangement of this carriage really is equivalent to a continuous flange of over 3 feet in depth, and a feature of great importance to the passenger is that it is not only a very safe way of traveling but it looks also very safe, and produces on the mind of the traveler a feeling of absolute security.

I finally decided to build an experimental line in the neighborhood of Brussels as an annex to the Exhibition of 1897, principally for two reasons: (1) Because the Belgian Government held out great inducements of large financial help. (2) Because I thought that the exhibition would enable a large number of people to visit the line. The chief inducement held out by the Government was the promise of finding the necessary motive power to any extent I might require. I asked for 2,000 hp., which I considered would be amply sufficient. Though the Government agreed to this, the difficulty of finding such power at the exhibition made them finally cut it down to 1,000 hp., and I thought I had better accept this than give up the experiment altogether. No current was furnished to me until the middle of June, 1897, when I obtained a very small portion of the current promised. The electrical station itself was only completed, as far as it ever was, by the middle of July. Practically, therefore, during the exhibition I was deprived of all the advantages which were promised to me. When the current was finally furnished some weeks' running were necessary before a high speed could be attained. The electrical station was so badly arranged, the machines being all of different types, that instead of having regularly available 1,000 hp., I could never rely upon getting more than about 500 hp. Notwithstanding all these drawbacks the experiments were conclusive in establishing the possibility of constructing at a moderate cost lines on the mono-rail principle, to be worked at a speed of double that of existing express trains with absolute safety.

The structure itself consisted of a single rail elevated about 4 feet from the ground, and supported on A-shaped steel trestles. The legs of these trestles were riveted to steel sleepers resting simply on the ballast. These triangular supports were placed about 3 feet 3 inches apart, and at each side were fixed laterally two rails, one about 18 inches above the other. These are the so-called guide-rails, their object being—

1. To brace the whole system together and increase its stability.
2. To engage the horizontal guide wheels of the car and prevent oscillation.
3. To counteract the effect of centrifugal force when rounding the curves.

The electrical conductor was a steel rail fixed on porcelain insulators attached to the sleepers. These rails were joined together by copper strips to preserve the electrical continuity. The return circuit for the electrical current was made through the line itself.

The car was over 60 feet long and 10 feet 10 inches wide.

It consisted of two bogies flexibly coupled together by a specially designed joint.

The part of the carriage below the main rail contained the whole of the mechanism, viz., four electrical motors of about 200 hp. each, suspended from the girders, and connected to

the axles of the driving wheels by specially designed chains.

A rigid iron arm was fixed between the body of the motors and the axles, to which they were coupled. This arrangement made the propelling force absolutely self-contained, so that it could not be affected by any shocks or oscillation that the car might receive.

There were 32 horizontal guide wheels acting on the guide rails for the purposes above described. The whole weight of the car was supported by eight double flanged main wheels, 4½ feet in diameter, the center wheels being driven, the two outer wheels being leading and trailing respectively. The ends of the car were pointed, to diminish the air resistance. The triangular spaces inclosed in these ends were reserved for the driver and conductor. The driver or electrician had under his hand the devices for starting, regulating speed and stopping.

As at a very high rate of speed the ordinary friction brakes might not be efficient, a device was invented by me to utilize the resistance of the air at very high speeds as a brake for slackening the speed so as to bring it within the range of efficiency of an ordinary friction brake.

This arrangement consisted of applying at the front end, outside, vertical louver plates turning on spindles. These presented a large resistance to the air when opened, which increased with the speed of the train, and they could be manipulated at will by the driver.

The interior of the car had sitting accommodation for 100 passengers. Each person had a separate seat, specially arranged so as to avoid discomfort while passing round the sharp curves at high speed.

The electrical current was picked up by trolleys attached to the car, but insulated from the bottom of the bogies.

Owing to the imperfect condition of the generating station, the great weight of the carriage and the difficulties of the line itself, the maximum speed obtained during August, September and October (the only months when the car was running during the exhibition) did not exceed 70 miles in the curves. Still, this result was not unsatisfactory, as to run with absolute safety through curves of 540 yards radius at a speed of 70 miles an hour for three months has never been done before, and this speed could be without difficulty largely increased, certainly to over 100 miles per hour, by increasing the power, or diminishing the weight, or having more favorable gradients. It was only in the beginning of February, 1898, that I was authorized to reconstruct the electrical station, and this was immediately begun, and the whole of the machinery put into working order, while the machine gallery was re-erected. During that time I also came to the conclusion that by removing the top of my carriage and lightening it, more advantageous results might be obtained, notwithstanding the defective electrical station and the difficulties of the line. For that purpose I had a new top to my carriage constructed in Belgium, so that, when completed, the old car with the new top weighed only about 59 tons, instead of 70. This was only completed by the beginning of April, 1898, and from that time until June 11th the Belgium Government Commission, as well as the Commissions of the Russian and French Governments paid many visits to the line, and carried out many experiments jointly with myself. Every possible measurement was taken,

*Abstract of paper read before the Society of Arts, London, Eng., March 13, 1901.

the car was run with half the guide wheels off at the maximum speed, and the car itself was even divided into two parts and one-half run at a time.

The tests applied were of every possible character, and the result was the line was found satisfactory in every respect, and capable of withstanding any pressure required, and showing the greatest stability. A speed was recorded at the rate of 83 miles an hour on the curves of 540 yards radius, a result considerably greater than had been attained previously, and probably higher speeds were occasionally attained. Traveling at that speed was extremely pleasant, and there was a feeling of perfect safety. The absence of vibration was marked, and no accident of the slightest kind happened during the whole of the experiments, notwithstanding the many thousands of people who came to see the line. The main results of the trial were that, given a proper line of sufficient extent to acquire the proper speed, and a properly constructed electrical station, very high speeds up to 120 to 130 miles an hour can be attained with absolute safety and moderate expense, so that lightning express railways can be built of the form which I designed to run at a speed exceeding considerably 100 miles an hour over the same curves and gradients in use on all ordinary main lines in England with absolute safety, as it is impossible to derail or to interfere with the stability of the line.

As the conditions of the proposed line between Manchester and Liverpool will practically do away with all the difficulties and drawbacks of the Brussels experimental line, it will be easy to attain the proposed speed of 110 miles an hour at a moderate cost on that line. The gradients will be easy and suitable for high speeds, the curves will not exceed 750 yards radius, the electrical station will be constructed with the very best and modern machinery, and with ample power.

The train will consist of one carriage, containing 60 or 90 passengers. The trains will start every 19 minutes from either end and will perform the journey in 20 minutes. The electrical station will be situated exactly half way at Warrington, and will have a capacity of about 7,500 hp.

The full speed of 110 miles will be attained within 1½ miles from the start by an acceleration of 1.5 feet per second.

The carrying capacity of the rolling stock, if only the smaller carriage is used, will be 12,000 passengers per day, viz., 6,000 in each direction, and with the larger carriage this can be increased to 18,000 per day.

I should also like to mention here a few words with regard to the absolute safety from collisions on the line, or of accidents of any kind such as one can foresee, and on the proposed system of signals and breaks to insure that safety.

The question of breaks and signals is so intimately connected that the one cannot be treated separately from the other.

Experiments by many eminent engineers have shown that with the Westinghouse brake it is possible to apply a retarding force of 3 miles per second. That is to say, that the speed of a train traveling 60 miles per hour can be reduced each second by 3 miles, and, therefore, it can be brought to a stop in 20 seconds. During this period the train will traverse a distance of about 300 yards. A train traveling at 30 miles per hour can be stopped in 10 seconds, during which time it will have traversed

a distance of about 73 yards. These actual experiences, therefore, show that, with the Westinghouse brake alone, it will probably be possible to stop a train traveling 110 miles per hour in 37 seconds, during which time it will have traveled 995 yards.

It is proposed to equip the new railway not only with the Westinghouse brake but also with an electric brake. This consists of one or two small dynamos which are connected for that purpose with the driving wheels. Where as in ordinary running the current from the generating station is used to rotate the motors, and thus produce speed, by connecting the driving wheels with the dynamos after the current from the generating station is cut off, the rotation of these wheels is utilized to drive the dynamos and to manufacture electricity, which is absorbed by resistances provided for that purpose. This effect can also be produced by short circuiting or reversing the motors, converting them thereby into dynamos.

Let me here remark that this does not in the least resemble reversing the engines on an ordinary steam locomotive. There is no question of stopping the driving wheels so as to make them slide or skid along the rails, but their rotation is used to produce electrical energy, and by absorbing this energy in the wheels create a strong magnetic field, retarding the train.

The power required to stop the train in 500 yards is about 84 hp., or 197 lbs. per square inch on the area of the break disk.

The main advantage of this electrical brake is that it is most effective at the very highest speeds, as of course, a high speed is more effective for generating electrical energy than a slow speed.

With the utilization, therefore, of both the electric brake and the Westinghouse, it is a matter of mathematical certainty that it will be perfectly possible to exercise a retarding force amply sufficient to bring the train to a standstill, from a speed of 110 miles per hour in a distance of about 500 yards, instead of 995 yards as above stated.

I do not wish to suggest that this is a rate of retardation I should desire to use except in dire emergency (which, however, I will show hereafter to be almost impossible to arise), as though it might not injure the passengers it would certainly be uncomfortable.

I only say that by the brakes proposed to be supplied it would certainly be possible upon an emergency (however improbable) to stop the train within the space mentioned.

It is, of course, evident that the most perfect condition under which a railway could be worked would be that in which both brakes and signals could be dispensed with; therefore it follows that the fewer the occasions for using either the better.

Now, in the ordinary way of working our existing railways there are many occasions in which it might be important to stop the train as rapidly as possible; for instance, if a train should be seen in front, or some shunting operations were not completed, or other causes too many to enumerate. But no brake, however powerful, is of the slightest use to-day to avoid a sudden obstacle, such as a stone placed on the rail, or a broken rail, as it is impossible for the driver to be aware of such obstacles until he is very close to them, or practically upon them. For these cases, therefore, the stoppage of 300 yards, or 200 yards, or even 100 yards, is quite useless.

What I wish to show now is, that on the proposed high-speed electrical railway, though it is quite possible to brake the train within 500 yards, it never can be necessary to bring it to a standstill in such a short distance.

On the proposed railway there are no level crossings, no switches, no shunting operations, and, in fact, nothing that will require the train to be brought to a standstill, except in the event of one train preceding another breaking down. Therefore, by clearly explaining the method of signaling the position of each train in relation to the other, the necessity for applying the brakes and the distance in which the trains would have to be stopped in case of a breakdown would be clearly appreciated. Beyond this the brakes need only be used for stopping as you approach the stations.

I now, therefore, have only to explain the manner in which it is arranged that the driver of each train shall be informed of the possible stoppage of the train in front of him.

We will take the case of the line from Manchester to Liverpool, of a length of 34½ miles. As the distance will be traversed in 20 minutes, and a train is to start every 10 minutes in the ordinary way, when everything goes all right, the train will only leave the station at Manchester when the first has reached Warrington, a distance of 17½ miles.

We will sub-divide the line for the purpose of signaling, say, into five sections of about seven miles each. As trains leave Manchester station a danger signal is put up electrically at that station. A second similar danger signal is put up as the train passes point 7 miles, the first remains at danger, and the train travels on; when it reaches 14 miles it puts up a third danger signal, and simultaneously the block is removed at Manchester station, so that the second train can leave when the time comes.

Now we will assume that the first train has met with an accident after passing point 14 miles, the second train would travel at full speed, but when it passes point 7 miles, the danger signal at that point not having been removed by the first train, as this never reached point 21 miles, the driver of the second train would be informed that the first train had met with an accident beyond point 14 miles, and, therefore, that he had to slow down, but that for such lowering of his speed he had a clear run of over 7 miles.

Therefore there could be no difficulty in any case to stop even without using the brakes by simply cutting off the current.

Whenever the train passes over a point where the danger signal is put up, this danger signal is also reproduced by a very simple and inexpensive contrivance in the cabin of the electrician, so that the conductor may hear it and see it, even if there was a thick fog.

Under these conditions of traveling it seems superfluous to have any emergency brakes, and though we shall be able to stop the trains within 500 yards, no case can be imagined in which it would be useful or necessary to resort to such stoppage.

Of course it is useful to have a powerful Westinghouse brake to stop as rapidly as possible at the station. This can be done easily in 1,000 yards on the level without using the electrical brake at all, and as we have a rise of 24 feet in the last 1,500 yards going into Liverpool and a rise of 46 feet in the last 1,200 yards going into Manchester, the cutting off of the current and the application of an ordinary Westinghouse brake about 1,200 yards from

the station, will stop the train quietly and comfortably at the stations.

In choosing for the first line to be worked at these speeds, the line between Manchester and Liverpool, the same reasons hold good which made Stephenson choose it for the first application of the steam railway. I hope to prove thereby to the great railway companies the advantages they would derive in adopting on all great main lines this system for the express passenger traffic alone, thereby solving the problem of increased speed with absolute punctuality, and punctuality not only for the express trains, but also for the working of their enormous traffic on their present rails, consisting of an ever increasing local passenger and goods traffic, which often so blocks the existing railways as to render their safe and punctual working absolutely impossible.

DIRECT-CURRENT GENERATORS.*

BY SIDNEY H. SHORT.*

Some months ago I received through Dr. Hopkinson your kind invitation to read a paper before this society. The letter expressed a desire that the paper be of a character to induce discussion by the members present. I have therefore selected the subject "Direct Current Generators," with the view to considering the feasibility of more nearly standardizing this class of electrical machinery. You will pardon me if I call to mind some well-known facts with reference to the construction and operation of dynamo-electric machines, which I find it necessary to do in order that I may indicate the changes which are taking place in the design of these machines, and to foreshadow the probable modifications which will produce better results in the future. We are all familiar with the original types, the first of which were made just 50 years ago. The pioneer designers produced dynamos which differed widely in the arrangement of their several parts as well as in the construction of the armatures and field magnets. Clark, who was the first to put into execution Faraday's great discovery of induction, used permanent magnets for the field, and an armature core provided with projections, each projection being wound with a coil of insulated wire, the ends of which were connected to commutator bars in the usual way. Gramme, on the other hand, used a ring of soft iron wire for an armature core, the coils of insulated wire being wound spirally around the section of the ring with branches at intervals leading to the commutator. This form is known as the Gramme ring, and for many years was a favorite with generator designers, but is fast going out of use. Early in the history of dynamo construction, Siemens devised the well-known drum winding, the coils of insulated wire being wound lengthwise and over the ends of a cylindrical armature core, with their terminals joined to the commutator strips. This winding in an improved form is now coming into general use, and promises to be the final one. All of the earlier machines were bipolar, with their armatures revolving at a high rate of speed between the two poles of a single U-shaped magnet. They were mostly belt-driven, especially in America, and to some extent in this country, but here the direct-driven high-speed generator made its first ap-

pearance in commercial form owing to the splendid engines available.

When the commercial value of the dynamo became apparent as a source of power for electric lighting, for operating motors, and for the many uses to which large electric currents are put, there sprang up a demand for machines of larger and larger capacity. The two-pole machines were increased in capacity until a limit of distortion was reached, where it was found impractical to further augment their dimensions. The next step, therefore, was the adoption of the multipolar type. In these machines there are two or more magnetic circuits formed in the same core by arranging two or more pairs of field magnets around the periphery of the armature. You are familiar with the advantages of this type of machine. A four-pole machine containing the same quantity of active material as two bipolar dynamos will have their combined output at half their speed. The ease with which these machines can be ventilated, owing to the large internal diameter of the armature, makes them run much cooler than the bipolar type. The arrangement of a number of sets of brushes around the periphery of the commutator permits the use of very short bars, rendering the mechanical construction most perfect. As direct-driven slow-speed generators having many poles are usually specified for our modern power stations, you will be interested in the details of their construction. The magnet frame is a ring of large diameter, usually with a rectangular section, having two feet or brackets cast integral with it, to support it in a vertical plane upon a masonry foundation. The width of the face and the cross-section of this frame do not differ very greatly in machines of different speeds and capacities, except for the very small ones, but the diameter depends on the capacity and number of poles. Some makers prefer to cast this frame in iron, others in steel; each have their advantages and disadvantages. On the whole, I prefer the cast-iron frame, because, while it is nearly twice as heavy as the steel one, it is more rigid and costs less. However, when very large machines are required to be shipped to great distances, it is necessary to use the steel castings, because of the smaller weight. The frame is always divided into two half rings, with finished joints, where they are bolted together. This division is usually on the horizontal plane, but one or two makers divide the ring vertically. On the inner periphery of the magnet frame at intervals are fastened an even number of pole-pieces, projecting radially towards the center. These pole pieces, are always made of good soft steel, sometimes rectangular in section and sometimes round. The area of the cross-section is about equal to that of a cast-iron yoke, but considerably greater than that of a steel yoke. The radial length of these poles, which does not vary greatly with the capacity of the machine, is from 12 to 15 inches. When the frame is made of cast-iron, these pole-pieces are composed of steel plates riveted together to make a nearly square section, and cast into the ring in the proper positions. If the frame is made of cast steel this method of attaching the poles cannot be advantageously used, but they must be bolted to finished surfaces, prepared for them, on the inner surface of the magnet ring, which is a much more expensive process. I must not neglect to explain, however, that when the pole-pieces are bolted to the steel frame they

may be cast in steel, with a round section, and provided with a suitable pole-shoe to fit the armature face, while with the laminated pole the shoe must be fitted to its inner end. On the whole, however, the laminated pole cast in the frame is cheapest, and lends itself to ease of manufacture. The pole-pieces are provided with spools, upon which are wound the magnet coils. These coils are connected in series, and the exciting current traversing them produces alternate positive and negative poles at their free ends.

This completes the essential parts of the stationary portion or field magnet of a multipolar generator. We will next turn our attention to the construction of the armature, with its commutator, which we will find more intricate. The engine shaft carries, besides its flywheel, a massive cast-iron armature hub, keyed to it securely. This hub is provided at its periphery with a flange bolted to the flywheel, thus relieving the shaft and keys from the torsional strain due to the interchange of energy between them. The armature hub is provided with a number of radiating arms, the ends of which are dovetailed parallel with the shaft for a length equal to the width of the pole-pieces. Into these dovetailed grooves are fitted the key pieces formed on the inner edges of the armature laminations. The laminations which form the magnetic portion of the armature ring are made from thin sheet steel of the softest quality. They are in the form of segments of a circle with notches in the outer edges. These segments are built on to the ends of the spokes of the armature hub, lapping joints, until a complete rim or core is formed equal to the width of the pole-faces. Occasional radial ducts are left so that the air may circulate freely through the core to carry away the heat produced by hysteresis and eddy currents. This mass of thin sheet segments is clamped firmly between two end rings of cast-iron, held together by bolts passing between them just inside the lamination. The notches in the edges of the sheets register perfectly, so that slots are formed across the face of the armature to receive the armature windings. An extension of the armature hub carries the commutator support, which is much like an ordinary spoked pulley. At each end of its face clamping rings are provided to secure the commutator bars. These strips are hard-drawn copper of the best quality, and should have a width at the face of the commutator of at least one-third inch. The mica which separates them should never exceed one-thirty-second of an inch, and must be of a very soft quality, so that it will wear more easily than the copper. The bars are beveled or notched at the ends to receive the mica insulating and clamping rings, which secure them to the face of the hub. The commutator is always smaller in diameter than the armature core. In fact it must not have a peripheral speed of more than 2,500 feet or 2,600 feet per minute. With higher-surface speeds it is difficult to prevent sparking. To each bar at the end nearest to the armature core is riveted and soldered a copper strip, projecting radially to the same diameter as the armature core, where it connects with the ends of the armature coils.

The armature coils are simple in construction. Ribbon copper, usually one-half inch by one-tenth inch, is cut into pieces long enough to make a complete coil. This strip is bent on

* Paper read before the Manchester (Eng.) Section of the Institution of Electrical Engineers, Jan. 29, 1901.

edge in the middle, making the two halves parallel with each other and about one-half inch apart; it is then bent flat wise around a former into a rectangular coil with V-shaped ends, joining the two parallel sides, the angle of the V at one end being formed by the terminals of the coil, which are afterwards soldered to the commutator leads. The coils are carefully taped with combination insulation made from paper, mica and linen webbing. They are saturated with insulating compound and baked before being placed in the armature slots. The coils span a segment of the periphery of the armature core equal to or slightly less than the pitch of one pole, one of the parallel sides being fitted into the bottom of a slot, while the other side occupies the top of another slot; two and sometimes more of these coils are placed side by side in the same slot, but it is not best to multiply the number. These coils overlap each other, making a closed circuit spiral winding around the face of the armature with each turn connected to a commutator bar. After the winding is completed, the coils are held in place by banding wires at intervals across the face of the core. The windings are connected to balancing rings placed conveniently between the armature core and commutator, each ring connecting at points of equal potential, ensuring uniform pressure between all the units making up the multipolar machine. It only remains to provide a support for the brushes which collect the current from the face of the commutator. Four brackets are bolted to the end of the frame, and in these the brush rocker rotates through a limited angle. This rocker carries a brush-holder and set of carbon brushes for each pole-piece. They are carefully insulated from the rocker and from each other, but all the positive brush-holders are connected to one massive ring, and all the negative holders to another. These cross-connecting rings form the terminals of the generator from which the leads pass to the working circuit.

The mechanical construction of direct-current generators has, as you can see, been very well developed, and there remain apparently very few improvements to be made in it. We will, therefore, have to look in other directions for changes which will improve their operation and diminish the cost of their manufacture. Until recently multipolar generators were constructed with a limited number of poles, and to accommodate them to the various speeds and increasing capacities required their proportions were distorted, as in the bipolar machines, with the unfortunate consequences always attendant on poor design. Recent machines are being built with an increasing number of poles, and generators of 1,000 kw. with 14 poles, 1,600 kw. with 16, and 3,000 kw. with 24, are in successful operation with speed ranging from 75 revolutions per minute for the larger size to 90 revolutions for the smaller. It is apparent that modern design is tending to a greater number of magnets in the direct-current generator, and it is interesting to see that, on the other hand, the modern alternating-current machine is being made with fewer and fewer poles. The frequency in modern direct-current generators is about 15 cycles per second, while in alternators for power transmission the frequency is as low as 25 cycles per second. Even in the mechanical construction and general appearance these two classes of machines are approaching each

other with this difference, that for the direct-current the armature must revolve to carry on the process of commutation, while in the alternator the field magnets are made to revolve. How far are these changes in design to be carried, and what are the causes acting to bring them about? Experience has taught us that there are certain mechanical, electrical and magnetic values, which, when strictly adhered to in the design of direct-current generators, produce the best working results.

We will apply the best average working values to a unit dynamo with one pair of poles, and for greater capacities add two or more of these units together in the form of multipolar machines to determine the best relation between speeds and capacities. The capacities of these machines thus made from unit dynamos will be fixed, depending on the capacity of the unit and the number of these units used in its design. The speed of these machines will also be established, as we have in the unit dynamo adopted certain values depending upon speed. I have taken for the unit dynamo a surface speed of 3,300 feet per minute for the armature; for the commutator a peripheral speed of 2,500 feet per minute. The teeth on the face of the armature have a pitch of one inch. The commutator bars (550-volt generator) are .377 inch wide, and the pressure between them is 10 volts. Every inch of the periphery of the armature face carries at full load 500 amperes; 10.3 million magnetic lines pass through the magnetic circuit in this unit dynamo. The density in the poles at full load is fixed at 95,000 lines per square inch, in the air it is 80,000, while in the teeth it reaches 120,000 lines. In the armature core the flux is reduced to 65,000 lines per square inch. A fair average frequency for direct-current generators is 1,600 alternations, or 800 cycles per minute; therefore, this unit must run when made into a bipolar machine 800 revolutions per minute and deliver 137½ kw. The performance of this machine will in every way be good, for the various values taken are those most satisfactory. Without making any changes in the dimensions of the parts or in the electrical and magnetic values, we will put two of these units together in the form of a multipolar generator. There will now be four poles, but they will have the same section and the same magnet spools. The armature will be doubled in circumference, also the slots and armature coils, commutator bars, brushes, brush-holders, and various other parts, all being interchangeable with those of the unit machine. This four-pole machine will deliver 275 kw., and the speed will be 400 revolutions per minute. Applying these unit dynamos in the construction of an eight-pole machine, we find that it runs 200 revolutions per minute and has an output of 550 kw. A 10-pole machine will run 160 revolutions per minute and deliver 687 kw.

The accompanying table gives the speeds, capacities and general dimensions of machines up to 30 poles, and in all of them we have not varied from our original data established for unit dynamo:

UNIT DYNAMO-ELECTRIC MACHINE.

Mechanical Data.

Pole pitch.....	25 in.
Peripheral speed arm.....	3,300 ft.
Tooth space.....	1 in.
Peripheral speed com.....	2,500 ft.
Thickness bar.....	.377 in.
Section pole-piece.....	125 sq. in.
Section yoke.....	150 sq. in.

Magnet Data.

Induction air.....	80,000 L.
teeth.....	120,000 "
armature.....	65,000 "
poles.....	95,000 "
yoke.....	35,000 "

Alternations per min..... = 1,600

Electrical Data.

Kilowatt capacity.....	137
Amperes per inductor.....	125
Volts per bar.....	10
Pressure of machine.....	550 V.

Poles.	R. P. M.	Amperes.	Kilo-watts.	Arm. dia. Ft.	Com. dia. Ft.	Kw. 100 revs.
2	800	250	137½	1.3	1.0	17.2
4	400	500	275	2.7	2.0	68.8
6	267	750	412½	4.0	3.0	154
8	200	1000	550	5.3	4.0	275
10	160	1250	687½	6.7	5.0	430
12	133	1500	825	7.9	6.0	619
14	111	1750	962½	9.2	7.0	844
16	100	2000	1100	10.6	8.0	1,100
18	80	2250	1337½	11.9	9.0	1,375
20	73	2500	1575	13.2	10.0	1,720
22	67	2750	1812½	14.6	10.9	2,070
24	63	3000	2050	15.9	11.9	2,460
26	61	3250	2287½	17.3	12.9	2,890
28	57	3500	2525	18.6	13.9	3,360
30	53	3750	2762½	19.9	14.9	3,820

A study of this table reveals the fact that when we have established certain running values to be used in the construction of multipolar generators, we must let the speed of the machine depend upon the output. In making up this table of speeds, the unit dynamo adopted works out well for capacities up to 1,000 kw. or 1,200 kw. For the larger machines, however, it is possible to load the armature with 600 or even 700 amperes per inch of periphery, thus lowering the number of poles, decreasing the diameter of the armature, and increasing the speed. A considerable variation in speed for a given output may be secured by varying the section of the magnetic circuit of the unit dynamo and the number used; the range through which this change in speed can be made is, however, limited. The advantages of a standard system of design as outlined here will be appreciated by manufacturers as well as by users of electrical apparatus, because of the interchangeability of parts and the certainty of uniformly perfect operation of every machine regardless of capacity. In all sizes of machines the same size pole-piece would be used. The magnet spools would all be interchangeable. The armature coils would all be alike. The brushes, brush-holders, and all the connecting parts would be made after the same patterns. The slots in all the armature laminations would have the same width and depth. These conditions, if existing, would greatly cheapen the cost of manufacturing dynamos, therefore the prices charged the purchaser. The steam engine stands in the way of accomplishing these results. The speeds and capacities of engines have been established by their makers without reference to the best conditions for the successful operations of the generators they are to drive. For the smaller dynamos, as you will see by the table given above, speeds of from 300 to 800 revolutions per minute are permissible and entirely proper, but when the larger capacities are reached the speed must be lowered in order to obtain good performance, especially for traction generators. I hope, therefore, that the builders of engines and the manufacturers of direct-current generators will co-operate in establishing a satisfactory scale of speeds and capacities for steam dynamo sets.

THE OUTHENIN-CHALANDRE ELECTROLYTIC ALKALI PROCESS.*

BY JOHN B. C. KERSHAW,
London.

This process for the production of alkalis and chlorine compounds by the electrolysis of solutions of sodium or potassium chloride is a diaphragm process and is in actual operation at Chèvres, near Geneva, and at Montiers, in France. Other works are being built to operate the same process in Italy and Spain. The English patents protecting the process are dated 1893 and 1896, and are numbered 15,906 and 15,834 respectively. The first relates to the cell design, the second to a modification in the process for improving the impurity of the chlorine evolved from the anode chamber of the cell.

Fig. 1 is a sectional elevation of the cell. The cell consists of an outer vessel K, and of an inner vessel A, entirely closed and built of materials unacted upon by chlorine gas or its compounds. This inner vessel is filled with rows of porous-diaphragm tubes *o o*, open at each end to the outer chamber, K, of the cell, and inclined at a slight angle, as shown in Fig. 1. Each tube is hermetically sealed into the walls of the chamber A by a special device shown at Z, and contains an iron sheet cathode running the whole length of its interior. These sheet cathodes join to a common terminal at M, and each vertical row of diaphragm tubes is thus served with current by the one electrical contact to the mains' supply. The anodes, I, are round rods of specially prepared carbon, fixed into the common lead head-piece U, and communicating at *e* with the negative terminal of the dynamo.

They hang vertically in rows of seven between the rows of diaphragm tubes, and the chlorine evolved at their surface collects in the upper portion of the anode chamber, and is carried away by the outlet pipe H. The right-hand side of the inner cell is provided with a sheet iron movable hood, V, and outlet pipe not shown in Fig. 1. This serves to collect and carry away the hydrogen liberated within the diaphragm tubes and facilitates its utilization for other purposes.

The cell is operated in the following manner: The inner chamber A is nearly filled with a concentrated solution of sodium hydrate. The electrical connections are then made. The chlorine gas liberated within the chamber A passes off by the pipe H, and is used for the manufacture of bleaching powder or for some other purpose. The sodium liberated at the surface of the sheet-iron cathodes decomposes the water present, yielding hydrogen gas and a solution of sodium hydrate. The first travels up the tubes, and escapes into the collecting chamber V, whence it passes to a gas-holder for storage until required. The solution of sodium hydrate, owing to its higher specific gravity than the surrounding solution, travels down the tubes, and collects on the bottom of the outer chamber of the cell. Since the cell design permits the hydrogen to pass away with a minimum disturbance of the electrolyte in this outer chamber, fairly concentrated solutions of sodium hydrate can be obtained, and when required are run off by the outlet pipe *v*.

The advantages claimed for this type of cell are: Complete separation of the electrolyte in

the anodic and cathodic compartments of the cell, with consequent prevention of hypochlorite and chlorate formation; collection and utilization of the hydrogen liberated at the cathodes. The disadvantages would appear to

FIG. 1.

Sectional Elevation of the Outhenin-Chalandre Type of Cell.

be a high emf. due to the diaphragms, and a very complicated structure, with consequent high cost for maintenance and repairs. That the cell has been operating at Chèvres since

acid present in excess of that required for the above decomposition shares in the electrolysis with production of Cl at the anode and H at the cathode.

The writer is informed that this modified process is in operation at Chèvres. It is obvious, however, that the chlorine liberated by direct electrolysis of hydrochloric acid is only gained by a double expenditure of electrical energy; for each atom of chlorine obtained in this way has first been separated by electrolysis of sodium chloride. The gain in purity of the chlorine liberated in the anode chamber of the cell is therefore purchased by an increase in the kilowatt hours per ton of chlorine produced, and the advantage is a doubtful one. Until figures have been published showing the yield of the Outhenin-Chalandre cell under actual working conditions, comparison of its efficiency with that of the Castner and Hargreaves-Bird cell is impossible.

The works at Chèvres are operated by power from the Geneva municipal generating station on the Rhine. The power is transmitted by air lines a short distance to the electrolytic works, and is used to operate a 1,200 hp. Thury motor generator and a 500 hp. Brown-Boveri motor generator, both giving direct current. Fig. 2 is a river-side view of the electrolytic alkali works. A portion of the chlorine produced in this works is used in the manufacture of pure chemicals for laboratory

FIG. 2.—THE ELECTROLYTIC ALKALI WORKS AT CHEVRES, SWITZERLAND.

1899 with presumably satisfactory results (for other works to operate the same process have since been planned) is proof that under certain conditions the advantages outweigh the disadvantages named above. The cell, however, cannot be considered a complete success, for oxygen and oxygen compounds are liberated with the chlorine at the anode, and it is in order to suppress these that the process has been modified in accordance with the details given in patent No. 15,834 of 1896. The hydrogen liberated at the cathodes is collected and burned in a special form of burner in an atmosphere of chlorine, and the hydrochloric acid which results from this combustion is fed into the anode chamber of the cell. Should ClO compounds be present these are decomposed with production of H₂O and Cl₂. The hydrochloric

and medical purposes. Liquefied chlorine is also one of the products of the works.

The greater portion is, however, used in the production of bleaching powder. As regards soda products, caustic lyes and solid caustic soda are manufactured to suit the requirements of the firm's customers. At the Paris 1900 Exhibition a block of solid caustic soda was exhibited by this firm, testing 75.6 per cent. Na₂O, equal to 97.6 per cent. NaOH. This shows that only comparatively small amounts of sodium chloride and other impurities find their way into the cathode compartment of the cell. The works at Chèvres are owned by the "Société Anonyme Suisse de l'Industrie Electro-Chimique Volta," a company which also owns and operates the carbide works at Ve-niers.

*From the "Electrician," London.

THE INSTITUTE'S CONVERSAZIONE.

The American Institute of Electrical Engineers held on Friday evening, April 12, its "conversazione," at Columbia University. There was a most attractive display of electrical apparatus and inventions of every description. Nikola Tesla exhibited his oscillator while Peter Cooper Hewitt's invention for lighting by means of incandescent gas was also in evidence.

In a room near the Hewitt lights were the akouphone and akoulalion invented by M. R. Hutchinson, and described recently in *ELECTRICITY*. They are microtelephonic instruments, so constructed as to reproduce and intensify sounds and still preserve their quality.

To show how the instruments worked there had been brought to the conversazione from the New York Institute for the Deaf about a dozen young men. Head instructor William H. Van Tassel was in charge of them and announced that they were the deafest of all the scholars in the institution. One of them, Oris Benson, was both deaf and blind. He cannot hear a gun shot off within a yard of his head, only perceiving the vibration of air caused thereby. It was his performance with the help of the akouphone that interested the spectators. Altogether he has never had but five hours of instruction in talking. His vocabulary is limited to a little more than a dozen words.

When Mr. Van Tassel spoke to him over the instrument, it was wonderful to see the expression of delight that spread over his previously sad face, the smile that came seeming almost to reach to the very edges of his sightless, dull eyes. In a hollow, mechanical voice he repeated the things he heard in the receiver of the akouphone. He said "bad boy," "papa," and several short words. Then a gramophone was attached to the instrument and he listened to a gay march, smiling and beating time on the table with his fingers.

H. R. Palmer's "fac simile picture telegraph" was one of the exhibits. This instrument is worked on a system whereby half-tone pictures, sketches, handwriting, and the like can be transmitted over long distances by employing ordinary telegraph circuits. The original picture is enlarged for transmission, but is photographically reduced to its normal size when received. The enlargement is for the purpose of obtaining a greater contact surface for the transmitting stylus.

A practical appliance, and one that everybody could understand the workings of, was the telepherage carrier, for the transportation of freight in small bulk. Above the carrier, which is a diminutive car, there runs a cable that obtains a current by contact with a lighter wire above. Along this supporting charged cable the car is made to speed at a lightning rate by the aid of a motor. The vehicle will be used for transferring packages from ship to shore, from tunnel to surface, and so on.

Dr. Francis B. Crocker, Professor of Electrical Engineering at Columbia University, had on view his appliance for showing the magnetic properties of liquids and their permeability. An elaborate display of Dr. M. I. Pupin's long-distance ocean telephony was to be seen in model form.

Wallemar Paulsen's telephonograph and telegraphone was examined by those present with much enthusiasm. It is an intricate appliance, to be used for sending a telephone

message to a person who is away from home. The message is recorded automatically, and when the person returns, he or she has but to press a button to hear the message repeated.

In all there were thirty-two exhibits. The guests numbered several hundred, among them being Thomas A. Edison, Nikola Tesla and other famous electrical engineers and scientists.

Exports of Electrical Material from New York.

The following are the exports of electrical material, from the port of New York, for the week ended April 3:

Antwerp, 11 cases, \$1,012; Berlin, 25 packages, \$3,600; Brazil, 21 packages, \$2,656; British East Indies, 261 cases, \$1,275; British Guiana, 61 packages, \$5,128; British West Indies, 12 packages, \$522; Central America, 12 packages, \$684; Chili, 1 package, \$19; Cuba, 84 cases, \$1,240; Dutch West Indies, 1 package, \$12; Ecuador, 1 case, \$27; Genoa, 79 packages, \$18,970; Hamburg, 18 packages, \$608; 6 cases motor vehicles, \$1,800; Havre, 194 packages, \$23,853; Hayti, 2 packages, \$51; Liverpool, 96 packages, \$9,801; London, 181 packages, \$12,498; 21 packages motor vehicles and parts, \$14,000; Manchester, 41 cases, \$10,365; Mexico, 64 packages, \$2,583; Moscow, 6 cases, \$420; Newcastle, 1 case, \$200; Oporto, 3 cases, \$196; Peru, 21 packages, \$1,925; Santo Domingo, 12 packages, \$160; Southampton, 37 packages, \$3,322; 1 case motor vehicles and parts, \$117; U. S. Colombia, 29 packages, \$235.

INCORPORATIONS.

The Citizens' Electric Light & Power Company, Columbus, O. Capital stock, \$50,000. Incorporators: C. A. Neff, C. H. Kilby, L. Q. Rawson and S. C. Pasco of North Amherst.

The Au Sable Electric Light & Power Company, Au Sable Forks, N. Y. Capital stock, \$25,000. Directors: James Rogers, George Chahoon and J. Monroe Sheffield, all of Au Sable Forks.

The International Electric Company, Trenton, N. J.—to build and operate plants for the purpose of furnishing electric light, heat and power. Capital stock, \$3,000,000. Incorporators: Adrian H. Miller, Charles M. Kling and Stephen C. Smith.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED APRIL 9, 1901.

ELECTRIC RAILWAYS AND APPLIANCES.

671,488. Trolley Finder for Electrical Railroads. Paul Goldsmith, Troy, N. Y. Filed Aug. 16, 1900.

671,445. Door for Trolley-Car Barns. William R. Kinnear, Columbus, O. Filed Nov. 7, 1900.

671,482. Electric-Railway System. Paul E. Herkner, Berlin, Germany. Filed Nov. 30, 1900.

671,491. System of Train Control. William B. Potter, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed June 12, 1899.

671,515. Contact-hoe for Electric Railways. George T. Hanchett, Hackensack, N. J., and John M. Murphy, Torrington, Conn., assignors to the Murphy Safety Third Rail Electric Company, New York City. Filed July 27, 1900.

671,866. Electric-Railway System. John M. Murphy, Torrington, Conn., assignor to the Safety Third Rail Electric Company of New York City. Filed Aug. 4, 1898.

ELECTRIC LIGHTS AND APPLIANCES.

671,512. Electric Arc Lamp. Thomas E. Drohan, Chicago, Ill. Filed June 12, 1900.

671,698. Electric-Lamp Receptacle. Wilbert E. McDonald, Chicago, Ill. Filed Sept. 22, 1897.

671,618. Flexible and Adjustable Supporting Device for Electric Lamps. William F. Brewster, New York City. Filed Nov. 30, 1900.

671,819. Flexible Supporting Structure for Electric Lamps. William F. Brewster, New York City. Original application filed Nov. 30, 1900. Divided and this application filed Jan. 23, 1901.

671,725. Heater for Electric Glow-Lamps. Frederick M. Goddard, Pittsburg, Pa., assignor to George Westinghouse, same place. Filed July 20, 1899.

ELECTRICAL MACHINERY AND APPARATUS.

671,490. Controller for Electric Motors. William B. Potter, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Dec. 30, 1897.

671,655. Power Transmitting Mechanism. Fredrick T. Overrocker, Philadelphia, Pa., assignor of one-third to Alonzo W. Allen, same place. Filed Dec. 27, 1900.

671,662. Electric Motor. Henry P. White, Kalamazoo, Mich., assignor of three-fourths to Charles D. Fuller, same place. Filed Oct. 5, 1899.

671,730. Frequency or Speed Indicator. Ralph D. Mershon, New York City, assignor to the Westinghouse Electric & Manufacturing Company of Pennsylvania. Filed July 12, 1899.

671,776. Annunciator. David Rousseau, New York City. Filed July 21, 1899.

671,883. Electric Switch. Francis Head, Philadelphia, Pa. Filed Jan. 28, 1901.

671,907. Controller for Motors. Frederick B. Duncan, Madison, Wis., assignor to the Northern Electrical Manufacturing Company, same place. Filed July 9, 1900.

TELEPHONES AND TELEPHONE APPARATUS.

671,458. Electric Telephone-Receiver. Ernest H. Strauss and Frank J. Stein, Chicago, Ill. Filed Aug. 13, 1900.

671,473. Holder for Telephone-Receivers. Thomas Emerson, Newport, R. I. Filed Sept. 27, 1900.

671,577. Telephone Desk. Charles E. Bartholomew, Hamilton, Can., assignor to John F. Stevenson, same place. Filed July 23, 1900.

MISCELLANEOUS.

671,489. Booster Crusher. Mathias Pfaticher and Charles H. Bedell, Philadelphia, Pa., assignors to the Electro Dynamic Company, same place. Filed Aug. 24, 1900.

671,507. Apparatus for Electrically Treating Gases. Reginald J. Yarnold, Streatham, Eng. Filed Aug. 29, 1899.

671,518. Phonograph. Frederick D'Arrey Gould, Worcester, Mass. Filed Jan. 18, 1899.

671,528. Brake for Spring Motors. Belford G. Royal, London, Eng., assignor to Thomas S. Parvin, Philadelphia, Pa. Filed May 16, 1899.

671,532. Automobile Vehicle. John H. Warren and John A. Hoffman, Cleveland, O. Filed Oct. 15, 1900.

671,569. Electrically-Heated Sad-Iron. John D. Theisz, Newport, Ky. Filed July 30, 1900.

671,575. Motor-Carriage. William J. Woosley, San Francisco, Cal. Filed Aug. 11, 1900.

671,625. Phonograph. Ellsworth A. Hawthorne, Montclair, N. J. Filed Jan. 18, 1900.

671,660. Electrically-Operated Fan. Richard W. Schmelz, Brooklyn, N. Y. Filed Nov. 6, 1900.

671,673. Variable-Speed Reversing-Drive for Automobiles. Whitcomb L. Judson, Chicago, Ill. Filed Nov. 6, 1899.

671,675-671,676. Power-Transmitting Device. Whitcomb L. Judson, Chicago, Ill. Filed April 20, 1900, Aug. 30, 1900.

671,687. Brace for Motors of Self Propelled Vehicles. James H. Bullard, Springfield, Mass., assignor to the Overman Automobile Company, Chicopee, Mass. Filed Aug. 1, 1900.

671,715. System of Electrical Distribution. Charles I. Young, Philadelphia, Pa., assignor to the Westinghouse Electric & Manufacturing Company of Pennsylvania. Filed Aug. 8, 1899.

671,721. Gearing for Automobiles. Frank L. Dyer, Montclair, N. J., assignor of one-fourth to Leonard Huntress Dyer, Washington, D. C. Filed Jan. 6, 1900.

671,732. Wireless-Telegraph System. Harry Shoemaker, Philadelphia, Pa., assignor of one-half to Marie V. Gehring, same place. Filed Oct. 18, 1900.

671,835. Hydraulic Press for Splicing Electrical Conductors. Thomas J. McTighe, New York City. Filed March 20, 1900.

671,856. Truck for Autocarets. John W. Darley, Jr., Baltimore, Md. Filed Sept. 4, 1900.

671,876. Self-Locking Insulators. Willard P. Beardsley, Altoona, Pa. Filed March 19, 1900.

671,891. Electric Toy. Arthur A. Kent, Lebanon, N. H., assignor of one half to Frank B. Kendrick and William F. Davis, same place, and partners under the firm name of Kendrick & Davis. Filed Jan. 29, 1901.

671,916. Electrolytic Water Purifying and Filtering-Apparatus. Charles E. Holland, New York City. Filed Nov. 28, 1900.

Announcement.

The Haines & Noyes Company, manufacturers of guaranteed telephone apparatus for every possible use, announce that they have now consolidated their sales department and factory at 118 132 W. Jackson Boulevard, Chicago, and that they are prepared to fill all orders, large and small, very promptly. The increased space will permit them to manufacture telephone apparatus in large quantities, and they state they will have a large stock on hand at all times. They inform us that they are adding many improvements to their instruments. They will be glad to send their latest bulletins to parties desiring same.

THE TELEPHONE WORLD.

Ohio Telephone Association.

The annual meeting of the Ohio Telephone Association, which was held recently in Columbus, was attended by about 300 representatives of independent telephone companies of the State. Judge J. M. Thomas of Cleveland presided and an interesting programme of papers and discussions was carried out. The association re-elected the following officers: President, Judge J. M. Thomas, Cleveland; first vice president, D. J. Cable, Lima; second vice-president, C. Y. McVey, Youngstown; secretary and treasurer, H. D. Critchfield, Cleveland.

The manner of taxing the companies for funds to carry on the work of the association was discussed and placed in the hands of a special committee, composed of Judge Thomas, Mr. Cable, Hon. Edward Kibler, Newark; Mr. Critchfield, Frank Davis, Columbus; Judge L. D. Hagerty, Columbus, and Hon. Harry M. Daugherty, Columbus. The association voted to pay \$4,000 on the bill of \$25,000 for legal services in the Berliner Telephone patent suit. The manufacturers and operators of plants are to pay \$12,000 of this amount, and Judge Thomas at the meeting at Chicago guaranteed the payment of \$4,000 by the Ohio Association.

Several interesting reports were submitted, among them a report of the Citizens' Telephone Company of Columbus, which showed that it had 4,988 phones in operation, and 390 in course of extension. Henry A. Lanman of the local company and Secretary J. Y. Bassell of the Columbus board of trade delivered the addresses of welcome, which were responded to by Judge Thomas. A vote of thanks was extended to the Citizens' Company for courtesies shown the visitors.

The Iowa Telephone Company is rebuilding with copper metallic circuits a number of its lines in Iowa. A crew is now reconstructing a line between Des Moines and Sioux City by way of Fort Dodge and Boone. The line as far as Fort Dodge has already been fully equipped. From Fort Dodge another copper metallic circuit will be built north through Humboldt and Forest City to Albert Lea, where it will connect with a line into Minneapolis and St. Paul. Other lines will also be constructed. It is claimed for the improvements now under way that when they are completed Des Moines will be able to talk to practically every town of importance in the State direct without repeating messages as is necessary now in order to reach a number of points.

The Rochester, Ind., Telephone Company has purchased the telegraph line along the Cudaby oil pipe line from Roann to San Pierre, a distance of 71 miles. The company will at once rebuild the line and open stations at Disko, Gilead, De-long, Monterey, Bass Lake, North Judson and San Pierre. At Roann connection will be had with the independent long-distance telephone service of Indiana, Ohio and other States. It will also connect with the local telephone systems at Kewanna, Plymouth, Akron, Winamac, North Judson and Knox.

It is announced that the Western Telephone Company will construct a line from Garretson to Dell Rapids, S. D., and that the line will be in operation by the first or the middle of June. The line will run by way of Sherman. It is understood that a number of farmers along the line will have connections made with their homes so that they can talk direct either with Garretson, Dell Rapids or Sioux Falls, saving them many a long and tiresome trip, and making it possible for them to keep posted without "coming to town."

The Home Telephone Company of Buffalo, N. Y., now numbers nearly 500 subscribers, showing a good record for its ten months' existence. Toll service has been in operation with Tonawanda for some weeks and with the prospect of a franchise for Lewiston the extended service will soon double its patronage. Notwithstanding statements to the contrary, the Home Company seems to be gaining a firm foothold.

Direct telephone connection between Brenham and Caldwell, Tex., was established recently by the completion of the Trans-Telephone Company's lines to the latter place. The line will be carried north as far as Milano in that State as soon as possible, and will be extended south from Brenham.

There are some good prospects of a combination being formed between the Chesapeake Telephone & Telegraph Company and the Newport News and Richmond Telephone & Telegraph Company, both of which have central offices at Williamsburg, Va.

J. W. Martin of the People's Telephone Company of Detroit, Mich., states that work on the construction of the plant will begin shortly.

Telephone Companies Unite.

Final steps were taken April 11 in the big telephone consolidation scheme engineered by the syndicate headed by Geo. R. Webb of Baltimore, Md. At the meeting of the directors of the United Telegraph & Telephone Company, the following properties were acquired:

Maryland Telephone & Telegraph Company; capital stock, \$1,000,000.

Pittsburg & Allegheny Telephone Company; capital stock, \$1,500,000.

West Penn Long Distance Telephone Company; capital stock, \$1,000,000.

Home Telephone & Electric Company; capital stock, \$300,000.

Allegheny County Telephone Company; capital stock, \$20,000.

Harford County Telephone Company; capital stock, \$10,000.

In all about 50,000 telephones, either in actual operation or under contract awaiting installation, will go into the combination. The United Company obtains a strong position in the Pittsburg territory by the interests absorbed there.

The Georgia Telephone & Telegraph Company of Savannah has issued a new list of stations, which shows that the company has added 400 subscribers to its list since last October. These additions give the company now slightly over 1,300 subscribers and others are being added daily—in fact, so great is the demand for phones that the company will be forced to add a new cable capable of accommodating 200 instruments. This cable has already been ordered, and it is expected that the work of drawing it in will be begun about May 1.

S. P. Light and W. D. Barnard, directors of the United Telephone & Telegraph Company of Philadelphia, Pa., have bought the Altoona Phoenix Telephone Company. The purchasers will connect the local system with their recent purchases in Montgomery, Chester, Delaware, Lancaster, Lebanon, Northumberland, Montour, Columbia, Union and Lycoming Counties.

Lockhart, Tex., now has regular telephone connection with all the surrounding towns and neighborhoods of Caldwell County. Maxwell, Reedville, Ublaud, Martindale, Mendoza, Lytton Springs, Dale, Tilton, Prairie Lea, Holmes, Fentress, McMahon and Luling are within talking distance of Lockhart.

Arrangements are now about complete for the construction of a telephone line between Laurel and Ellenville, Miss. As soon as this line is in working order lines will be strung to other points, and it will be only a few years until all points in southeast Mississippi will be connected by telephone. Local parties are behind the scheme, and are receiving united support.

L. B. Foley, of New York, superintendent of telegraph for Delaware, Lackawanna & Western, was in Binghamton, N. Y., recently, to make preparations for reorganizing the telephone system in the yards of that city. There are now eleven telephones in operation and it is expected that a number will be added and the system entirely changed.

John Smoulter, a banker of Wilkes-Barre, Pa., has a large financial interest in the new Independent Telephone Company of Seattle, Wash. He says that work will begin at once and that the system will be carried through Washington to Portland and eventually to California.

The New England Telephone Company will shortly begin to set poles and string wires for the establishment of a telephone exchange at Shelburne, Mass.

The West Liberty Telephone Company has been granted the use of the streets and alleys of Muscatine, Ia., to erect its poles.

At a recent meeting of the Idaho Springs, Col., city council the Pasquez Valley Independent Telephone Company made application for a franchise.

Bassett, Neb., is to have telephone connection with Springfield, the county seat of Keya Paha County, and also Carnes in the same county. The line will be about 45 miles long.

The Central Union Telephone Company has received material for a telephone line from Bloomdale to Eagleville, O., and will put in a toll station there.

The Union Telephone Company of Athens, O., has increased its capital stock from \$15,000 to \$30,000.

An Independent Telephone Combine.

Barber & Bailey of Wauseon, O., who in the last few years have established fifteen different independent telephone companies in various parts of Ohio, Indiana and New York, retaining an interest in nearly if not all, are endeavoring to form a combination of the fifteen companies.

The Farmers' Co-Operative Telephone Company has been organized in Clark's Hill, Ind., to meet the rates of the Bell and other companies. Subscribers must pay toll to use the city service of the old companies, while the co-operative company offers free service to all city switchboards operated by it at only 25 and 50 cents a month. As a result many subscribers to the old companies have withdrawn their support.

The long wire fences which many Australian herd owners have been compelled to make to protect their lands from the rabbits are now used to a great extent as telephone conductors which the neighbors communicate with each other. In many cases the distance covered is as great as 14 miles. Although the wires are somewhat defectively insulated, they perform their function in an excellent manner.

The Hinton, W. Va., Consolidated Telephone Company's plant has been sold by the stockholders to satisfy the indebtedness against the company. The property was bought by B. F. Mann, and will be consolidated with the Monroe and Greenbrier system, which owns several hundred miles of lines. This consolidation will connect nine counties in that part of the State and also have connection in Virginia.

The Commercial Telephone Company of Warsaw, Ind., announces that if a sufficient number of subscribers can be obtained it will extend its lines throughout the country and give to the farmers the same service as is given to the city people. The lines will be connected with the city system and the rental rate will be the same as that in Warsaw.

Franchises for telephone lines have lately been granted by the boroughs of Athens, Sayre, South Waverly and Tonawanda, Pa., to an organization of local capitalists. Application for franchises has been made in three other boroughs and in the city of Elmira by the same interests.

The Union linemen employed by the New England Telephone & Telegraph Company as well as the Boston Electric Light Company, have given notice of a strike on May 1 unless they are given an eight-hour day and a raise in wages of 50 cents per day. One thousand men may go out.

It was recently reported on apparently good authority that the Ansonia, Conn., Telephone Company would shortly be absorbed by the Southern New England Telephone Company. It is said that several of the large stockholders of the Ansonia company have already disposed of their holdings to the other corporation.

The wire for the new telephone line between Van Buren and Edmuntston, Me., will soon be laid and later a new line will be built from Van Buren to Caribou in that State, and connect with the New England Telephone Company.

The new telephone line will soon be completed to Buffalo Lithia Springs, Va., which will make connection with a great many of the North Carolina and Virginia cities, also nearly every village.

A report from Minneapolis, Minn., states that the Zenith Telephone Company will increase its funds by an issue of \$100,000 in bonds, which will be used for extensions to the system and for a commencement of the long distance system.

The Northern New York Telephone Company will probably extend its line to Tupper Lake this spring.

The Farina & Vandalla Telephone Company of Farina, Ill., has increased its capital stock from \$2,500 to \$5,000.

TELEPHONE INCORPORATIONS.

The Green's Fork Co-operative Telephone Company of Green's Fork, Ind. Capital stock, \$4,000.

The Enterprise Telephone Company, Elgerton, Minn. Capital stock, \$50,000. Directors: Edward Yocum, William Lockwood, C. G. Brady, C. S. Howard and H. W. Davies.

The Clarendon Telephone Company, Clarendon, Tex. Capital stock, \$3,000. Incorporators: R. W. Talley, John M. Clower, J. D. Stocking and A. M. Beville.

The Interstate Telephone Company, Camden, N. J.—to operate telephone lines. Capital stock, \$100,000. Incorporators: Paul W. Muller, Camden, N. J.; Max Phillips and F. R. Hansell.

GENERAL ELECTRICAL NEWS.

Lighting.

Abbeville, S. C.—The Abbeville Electric Light & Power Company will issue \$10,000 of bonds for improvement purposes. C. G. Sayre, general manager.

Amherstburg, Ont.—The plant of the electric light company was recently destroyed by fire.

Baker City, Ore.—An election will be held April 29 to vote on the question of issuing \$100,000 bonds for the construction of an electric light plant and the improvement of its water system.

Booth Bay Harbor, Me.—The Booth Bay Harbor Light, Heat & Power Company has been organized in this city for the purpose of generating and supplying gas or electricity with \$10,000 capital stock. K. H. Richard is president.

Brazil, Ind.—This city is taking steps to put in and operate its own electric light plant.

Burlingame, Kan.—The citizens of this place are agitating the question of electric lights.

Butler, Mo.—At the recent city election the proposition to issue \$10,000 in bonds to erect an electric plant was carried by an overwhelming majority.

Canton, W. Va.—The electric light power house in this village was burned a short time ago.

Carthage, Ind.—The town council has granted a franchise to Ed. Hill to put in a water and electric light plant.

Cedar Springs, Mich.—J. H. Worden will soon install an electric light plant in his new planing mill.

Clear Lake, S. D.—A local company is being organized to erect an electric light plant.

Clifton, Tenn.—T. S. Hughes and J. G. Russ will establish an electric light plant here.

Daytona, Fla.—A Schantz of Dayton, O., has purchased a site at this place and will erect an electric light plant.

Fairfield, Ia.—The citizens of this place have voted to establish a municipal electric light plant.

Greenwood, Ind.—Greenwood has voted in favor of permitting a company to build an electric light and waterworks plant.

Greenville, Miss.—H. Crittenden and others have organized a \$25,000 company for the establishment of an electric light plant.

Indianapolis, Ind.—The board of works has instructed City Engineer Jeup to prepare specifications for a new electric light contract, and bids will be advertised for shortly.

Lincoln, Neb.—The proposition to permit the city council to issue \$55,000 in bonds to establish and maintain an electric light plant was carried at the recent election.

Manchester, Vt.—An electric light plant will be installed here by J. Marsden, of Utica, N. Y.

Mansfield, O.—An election will be held May 6 to vote on the question of bonding the city for \$65,000 for the establishment of a municipal electric light plant in connection with the sanitary plant now in process of construction here.

Michigan City, Ind.—The Laporte & Michigan City Railway Company is after a franchise for an electric light, heat and power plant in this city.

Minot, N. D.—Minot has granted an electric light franchise to L. M. Davis.

Oskaloosa, Ia.—Among the improvements for this place are an electric railroad, an electric light plant and a heating plant. This alone will cost \$275,000.

Pittsburg, Tex.—The plant of the Pittsburg Ice & Electric Light Company was lately destroyed by fire. The loss is estimated at \$7,000.

Salisbury, N. C.—The gas plant and electric light plant at this place have been purchased and will be remodeled and renovated. The J. B. White Company can be addressed.

Sharpsburg, Pa.—The city council contemplates the issuance of \$30,000 in bonds to improve its electric light plant. An election will be called to vote on the question.

Worcester, Mass.—The Worcester Electric Light Company will ask the city for permission to lay 10 miles of conduits this year. To do the work more than \$200,000 will be spent.

Street Railways.

Baltimore, Md.—The incorporators of the Washington & Annapolis Electric Railway Company are trying to interest Philadelphia capitalists and the Johnson street railway syndicate in a plan to construct a trolley line from Philadelphia to this city.

Canton, O.—The Canton-Akron Electric Railway Company has been incorporated by W. H. Hoover of New Berlin, C. A. Kolp, J. C. Welty and others. The company's capital stock will be \$600,000, and an electric line will be built from here to Akron.

Carrollton, Ky.—The Carrollton, Worthville & Owenton Electric Railroad Company will erect an electric road from Milton to Owenton a distance of 40 miles.

Charleston, S. C.—The Exposition Traction Company of this place, has been granted a franchise and will build a car line from here to the exposition grounds.

Cincinnati, O.—The Cincinnati & Eastern Electric Railway Company, which will build the line to New Richmond, has increased its capital stock from \$10,000 to \$500,000.

Corsicana, Tex.—R. Stanhop, representing St. Louis capitalists, has a plan for building an electric railway here.

Elkin, N. C.—The prospects for building an electric railway from here to Sparta seem to be good.

Findlay, O.—The Toledo & Findlay Traction Company, capitalized for \$1,500,000, will build an electric railway from Toledo to this city.

Garrett, Ind.—The Garrett, Auburn & Northern Electric Railway Company was lately incorporated with \$10,000 capital stock. It will extend from this place to a point near the shore of Fish Lake in the extreme northern part of the State.

Iola, Kan.—The Secretary of State has issued a charter to the Iola Electric Street Railway Company, capitalized at \$50,000. The company proposes to build and equip the line this summer running through Iola and adjacent small towns in the gas belt. F. V. Crouch of Carrollton, Mo., is president.

Mattoon, Ill.—The directors of the Charleston & Mattoon Electric Railway Company have decided to issue bonds to the amount of \$200,000 for the construction of the proposed line between this city and Charleston, a distance of 12 miles. The promoters of the project are Forbes Holton of Huntington, W. Va.; Henry Rawie of Anderson, Ind., and prominent Coles County capitalists.

Maysville, Ky.—It is said that capitalists are taking the preliminary steps to construct an electric railroad from here to Tolesboro.

Newark, N. J.—A company is to be organized to build a trolley line from Bloomfield to Irvington. Representatives of Essex County capitalists have been busy in an effort to obtain the right of way from property owners. Among those behind the scheme are Francis M. Eppley and former Mayor George A. Smith of Vailsburg.

Republic, Wash.—The Ives Investment Company, owners of the California Mine, has in contemplation the construction of an electric railway between Grand Forks and this place.

Smithville, Ky.—The Louisville, Mt. Washington & Fairfield Electric Railway Company will build its proposed power house here. Judge W. B. Hoke is president of the company.

Trenton, N. J.—The Philadelphia, Trenton & New York Railroad Company, which is a link in the Johnson chain to connect New York and Philadelphia by trolley, has been incorporated with an authorized capital stock of \$500,000.

Warren, O.—The Cleveland & Chagrin Falls Electric Railway Company lately closed contracts for the private right of way from Garrettsville to this city.

Ymir, B. C.—The Ymir mine, near this place, is planning to make an immense improvement to the mining industry by building an electric tramway from the mine to this town, a distance of four miles. The tramway is to be used for the hauling of concentrates and for transporting supplies and timber to the mine.

Manufacturing.

Camden, N. J.—The E. L. Roe Electrical Company, capitalized at \$50,000, has been formed for the purpose of manufacturing electrical supplies.

Central Falls, R. I.—The Rhode Island Electrical Works has located here and will manufacture magnet wire.

New York City.—The plant and business of the insolvent National Electrical Manufacturing Company has been purchased by the Bunnell Telegraphic & Electrical Company of this city.—A concern known as the Traction Company and capitalized at \$250,000 has been organized here to manufacture traction engines. Herbert Knight David J. Newland and F. W. Roller are back of the enterprise.

Oconomowoc, Wis.—A proposition for the establishment of a factory for the manufacture of electrical instruments here has been submitted to the local business men's association.

Waukegan, Ill.—Blewitt Lee, Max J. Spiegel and Samuel Adams have organized the Porter Battery Company with a capital of \$300,000. The concern will manufacture electric storage batteries.

Company Matters.

Allentown, Pa.—R. Bachman, A. Missiner and S. P. Gemmel have organized the Star Electric Company. Besides doing a wiring and contracting business they carry a full line of electrical supplies. Dynamos and motors are overhauled by them and all kinds of repairing done.

East Orange, N. J.—The Morris Electric Company of New York will shortly build a factory here.

Power and Transmission.

Chippewa City, Wis.—The proprietors of the Stanley saw mill contemplate converting it into an electric power plant. The power will be transmitted to Chippewa Falls, and utilized for the motive power in the Stanley planing mill.

Davenport, Wash.—At a recent council meeting W. T. Steel and W. E. Eldrige, representing the Big Bend Light & Power Company, made application for a franchise through the streets of this city to transmit power from their plant on the Spokane River to the Big Bend Flour Mill. They also stated that they expected to spend \$250,000 in Lincoln County this year and next year. The council granted the prayer of the petitioners.

Phoenix, Ariz.—A party of hydraulic engineers has completed a trip to the Grand Canyon of the Colorado River, and reports that it will be possible to install a power plant in one of several places on the lower end of the canyon capable of supplying a greater horse power than is now being utilized at Niagara. It is said that a company of Eastern capitalists proposes to install large plants as soon as Government arrangements are perfected. Electric trolley line observation cars along the rim of the canyon for 15 miles are also contemplated.

The Dalles, Ore.—The Interstate Power Company has been incorporated to construct and operate an electric light plant at the mouth of the Deschutes River, for the purpose of generating and conducting electric power to points in Wasco, Sherman and other counties. E. Kurtz, W. M. Monod, H. L. Kuck and others are interested in the scheme.

Automobiles.

Franklin, N. H.—An automobile line between here and Tilton to take the place of the proposed electric line has been suggested.

Newport, R. I.—Despite the report that the New England Electric Vehicle Transportation Company has decided to wind up its affairs, it is stated that its branch here will be doing business at the old stand this summer, where a large number of orders for vehicles has already been booked, after which the depot may close.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

a The United Railways & Electric Company comprises in its organization the Baltimore Consolidated Railway Company, the Baltimore City Passenger Railway Company, all the lines of street railway operated by these companies, and also the Central Railway Co. of Baltimore. The pref. stock of U. R. & E. Co. has been issued in the form of income bonds.
b Leased to Boston Elevated Railroad Company.
c Owned by Brooklyn Rapid Transit Company.
d Leased to Brooklyn Heights Railroad Co., which guarantees 10% on capital stock.
e Stock owned by Brooklyn Rapid Transit Company; road operated by Brooklyn Hts. Co.
f Stock owned by Kings County Traction Company; road leased to Nassau Electric RR.
g Owned by Atlantic Ave. RR. and leased to Nassau Electric.
h 90 per share on outstanding capital paid as rental by lessee—West Chicago St. RR. Co.; \$200,000 of stock owned by North Chicago Street Railroad Company.
i Controls by lease Chicago West Division Railway, Chicago Passenger Railway, and West Chicago Street Railroad Tunnel Company.
j 30 per annum paid on outstanding capital as rental by lessee—North Chicago Street Railroad Company; \$625,100 of stock owned by West Chicago Street Railroad Company.
k Majority of stock owned by Chicago West Division Railway Company; 5% on \$1,000,000 stock guaranteed by West Chicago Street Railway Company, lessee.
l Cincinnati St. Railway purchased the Mt. A. & Eden Park road, assuming its bonds.

Unlisted: Full paid. Outstanding: Ex div.

a Leased to New Orleans Traction Company at 6% on stock.
b Leased to New Orleans Traction Company at 8% on stock.
c Leased to Central Crosstown Railroad at 8% on stock and interest on bonds.
d Operating the former Met. Trac. system, that corporation having become extinct.
e Leased to 23d Street Ry. for 99 years; lease assigned to Metropolitan Street Ry.
f Leased to Houston, West Street & Pavyon Ferry—now Metropolitan Street Ry.
g Leased to Metropolitan Street Ry. at 8% on stock until Oct. 1, 1897; thereafter 9%.
h Leased to Metropolitan Street Ry. for 99 years from Jan. 1, 1895, at \$215,000 per annum.
i Leased to Met. St. Ry. for 99 years from April 20, 1892; 6% first 5 years, 8% thereafter.
j Leased to Metropolitan Street Railway for \$145,000 per annum.
k Leased to Metropolitan Street Railway for 18% on capital stock.
l Controlled by Third Avenue Railroad by purchase.
m Dividends of 15% yearly guaranteed by Consolidated Traction Company.
n Controls by lease the Allegheny, Cent., Citizens' Duquesne, Fort Pitt & Pitt's Traction.
o Leased to Consolidated Traction Company for 8% per annum on par value of stock.
p Leased to Fort Pitt Traction Company for 6% on \$8,000,000 capital stock.
q Leased to Consolidated Traction Company for 4% on capital stock.
r Leased to Consolidated Traction Company for 7% on capital stock.

TELEPHONE AND TELEGRAPH COS.

* Unlisted. † Paid in. ‡ Full paid. § Outstanding. ¶ Ex-div.
a Leased to Hestonville, Man & Fairmount Passenger Ry. for 6% on stock per annum.
b Consolidation Electric, People's and Philadelphia Traction Companies. Fixed charges and all indebtedness of constituent and leased companies assumed by Union Traction Company.
c Practically all shares owned by Union Traction Company.
d Lease to Frankford & Southwark Passenger Ry. assumed by Electric Traction Co.
e Leased to Electric Traction Company.
f Controlled by Frankford & Southwark Passenger Railway.
g Leased to People's Passenger Railway at \$5 per share.
h Majority of stock owned by People's Traction Company.
i Leased to Union Traction Company.
j Lease transferred to Union Traction Company.
k Leased to Union Traction Company at a rental of \$10,000 per annum in 1886-7-8; in 1890-1899 and \$30,000 per annum thereafter, payable semi-annually, rental declared as a dividend semi-annually.
l Dividend of 10% guaranteed by Reading Traction Company.
m Dividend of 6% guaranteed by Reading Traction Company.
n Leased and operated by the Scranton Railway Co., formerly Scranton Traction Co.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16½@16¾c.; Lake, 16½@16¾c. casting, 16½@16¾c.

General Electric furnished the spectacular movement of the week by jumping about 20 points.

The International Electric Company, capital \$3,000,000, has been incorporated under New Jersey laws.

It is understood that nothing will be done in the Chicago elevated railway consolidation matter for some time.

The Citizens' Light & Power Company of Rochester, N. Y., will vote May 2 on increasing the capital stock to \$2,500,000.

The annual meeting of the New England Telephone and Telegraph Company will be held May 6. Books close April 25 and reopen May 15.

Business failures in the United States last week numbered 203, against 193 the same week last year; in Canada there were 24, against 41 last year.

The Philadelphia Electric Company's report for the year ended December 31 shows a surplus of \$131,497, or about 2½ per cent. on the amount paid in.

It is stated that the Chattanooga Rapid Transit Company will absorb the Chattanooga City Electric Railway Company and other lines into one system, with a capital of over \$1,000,000.

A consolidation of the important gas and electric light companies of Cincinnati has taken place under the name of the Cincinnati Gas and Electric Company with a capital stock of \$28,000,000.

The Metropolitan Elevated Railroad Company of Chicago has authorized \$5,000,000 4 per cent. 27-year extension bonds, subject to redemption at 105 on any interest day on four weeks notice.

The position of the copper market seems to be a firm one with considerable business going on at the full basis of 17 cents for Lake ingot. Of recent sales for export, 17 cents was the basis of the trades.

Shareholders of the American Railway Electric Light Company, the Columbian Electric Car Lighting and Heat Company and the United Electric Company will meet April 24, 25 and 26, to act upon the proposition to sell the stock of each to the Refrigerator Company.

The following are quotations for some of the industrial stocks not quoted elsewhere: Electrical Lead Reduction, 4½@4¾; Electric Boat, 20@20½; Electric Vehicle, 11@13; Tel. & Tel. Company of America (full paid) 6@7; Electric Company of America, 8½@8¾; National Carbon, 16@16½.

The Delaware General Electric Railway Company on Monday filed with the Recorder of Deeds for Kent County, Delaware, a mortgage for \$1,000,000 given to the Knickerbocker Trust Company of New York City for the construction of the Kent County trolley, work on which is to be begun this week.

The Electric Vehicle Company has decided to issue \$1,675,000 6 per cent. bonds. The bonds have been underwritten at 90 by a syndicate which agreed to take all that are not subscribed for by the stockholders of record at the close of business April 22. The \$1,507,500 derived will more than pay off all existing debts of the Electric Vehicle Company, and the surplus will be paid into the treasury to be used for working capital.

The Printing Telegraph Company said Monday: "The American Railways Company will ask the Chicago city council for a fifty-year franchise for a new south side elevated railroad. The road is to extend from Van Buren street to Sixty-third street in a southerly or southeasterly direction. South of Sixty-third street the line can extend within the city limits. A five-cent fare for a continuous ride over the road and its branches is provided for. It is to be operated by electricity or some equally clean motive power."

The Philadelphia "Stockholder," says: "It is believed in traction and market circles that important developments involving the Pittsburg traction systems are near at hand, which, when announced, will be followed by sharp price advancements. Of what nature expected developments are to be is not known; but the character of recent buying in Philadelphia Company and Consolidated Traction common are believed to suggest something favorable to stockholders in both companies. Consensus of opinion is that consolidation of the Pittsburg traction systems are being considered, and before very long all its systems will be merged into one similar to our Union Traction. As mergers and combinations are the order of the day, it would not seem to be a difficult matter to complete a consolidated trolley system in Pittsburg."

The Boston "News Bureau" says "the Erie Telephone situation is becoming intensely interesting as there are rumors of a possible contest for control. The Telephone, Telegraph and Cable Company bought in February, 1900, a controlling interest in the stock, 50,001 shares at \$115 per share. Later, to secure financial assistance for Erie, it parted with 29,000 shares of the stock of the company at \$100 per share, retaining 21,000 shares, which now stand at an average cost of \$137.38 per share. Soon after the transfer of the 29,000 shares to the Eastern people the stock was raided down to \$48 per share for the purpose of compelling the owners of the 21,000 shares and the holders of the 29,000 shares to throw over their stock. Various rumors come to the front, one to the effect that the American Bell Telephone Company proposed to buy Erie at its own price. After the decline to \$48 there was a quick rally to \$66 and persons friendly to Bell interests are credited with buying 15,000 shares. Indications now are that the Cable Company is endeavoring to average up its holdings with a view to again securing control and the new interests at present owning 15,000 shares may try to secure control in the interests of the Bell Company. If Bell again loses its control of Erie and it passes into the hands of the Independents who, it is said, have already arranged with a large trust company to finance Erie on a broad and liberal basis, all stock purchased under par by the Cable Company will reduce the cost of their present 21,000 shares."

ELECTRICITY.

EDITORIAL NOTES.

The Independent Telephone Association Convention.

The Independent Telephone Association of the United States of America will hold its next Convention in Buffalo, N. Y., on June 11, 12 and 13. The programme, which has not as yet been definitely decided upon, is expected to be elaborate, and there is no doubt but that it will prove as profitable and enjoyable as those of former meetings. It was decided to hold the Convention in Buffalo on account of the Pan-American Exposition being there, which was a most happy thought, as it will not only afford members of the Association an opportunity of seeing the sights, but it will also enable the representatives of the Pan-American countries to inspect the high grade telephonic apparatus manufactured by the independent companies.

Provision as usual has been made with the railroads to carry the visitors at one and one-third fare for the round trip, while a committee will arrange for special rates at the hotels for those attending the Convention.

This year's meeting should prove most instructive and enjoyable, and there should be a feeling among the members of work well done now that the Berliner patent incubus has been thrust aside. That the recent decision means much to the independent telephone movement is clearly shown in the increased number of independent telephone companies that have been incorporated of late. Capital that has been held back is now evidently being put forward and it will not be long before the independent movement will cause the monopoly more anxiety than it has heretofore.

* * *

Some Important Electrical Doings.

Just at present there are a number of important things going on in the electrical industry that should prove of interest to the electrical fraternity. In the first place—what should interest investors—the General Electric Company has just issued a circular letter announcing that, upon the written request of any holder of preferred stock of the company, the preferred stock of such holder shall be received in exchange for common stock, and that certificates for common stock shall be issued therefor, share for share, upon surrender and cancellation of the certificates for the preferred stock received

upon such exchange. The time of making such exchange has been limited to the period beginning the 15th day of May and ending the 1st day of August.

Holders of preferred stock desiring to avail themselves of the opportunity of making such exchange must, within the period above prescribed, present to the Farmers' Loan and Trust Company their certificates, duly indorsed in blank, together with a written request for such exchange in the form furnished herewith.

The certificates for common stock will be issued only in the name of the registered holders of the preferred stock surrendered for exchange.

In the development line a dispatch from Montreal, Canada, states that an application for incorporation is now being considered by the Canadian Parliament from a concern which asks most extraordinary powers, perhaps greater than has ever before been requested from the Dominion of Canada. The bill is for the incorporation in Canada of the St. Lawrence Power Company, now operating at Massena, N. Y.

The intentions of the company with respect to Canada are shrouded in mystery, but its purpose in the United States is well known. The company already has a charter, obtained from the State of New Jersey, and under its authority is developing 150,000 hp. at Massena, N. Y., sixty miles from Montreal, where it is its purpose to establish an extensive manufacturing community, attracting all possible industries to that locality. Of the 150,000 horse power, just half will be turned into electricity.

The remarkable powers asked by the new company from the Canadian Government would enable it to carry on an enormous business, of which the supplying of light and power to a city like Montreal would form a very small part. It asks for the right to manufacture, use, supply, and dispose of electricity, water, gas, and hydraulic and other power; to maintain works for the production, sale, and distribution thereof, and for these purposes may construct and operate canals, water courses, raceways, and water powers in or adjacent to the St. Lawrence River at any points eastward from Dickenson's Landing, and construct dams, wing dams, sluices, conduits and buildings.

It also wishes to acquire patent rights, manufacture and dispose of pulp wood, calcium carbide, acetylene gas, and other carbide pro-

ducts, mine minerals, construct furnaces, ovens, etc.; construct tramways, wharves, own vessels, conduct a towing business on the St. Lawrence and adjacent waterways, and other things.

Incidentally it is reported that the Canadians do not relish this so-called "American invasion."

Another mammoth scheme is heard of from Connecticut. The Legislature of that State passed a bill a few days ago giving great powers to the Consolidated Lake Superior Power Company, a twenty-million dollar corporation. According to the terms of the bill the company is permitted to engage in owning and operating railroads, steamships, sailing vessels, express business, furnishing water and light, to buy and sell all kinds of stocks, bonds and securities, and it may do business in the United States and Canada. The company may increase its capital stock as it sees fit, but may not operate in Connecticut unless under a special charter.

From the above it will be seen that there are a number of important electrical undertakings on foot, to say nothing of a \$90,000,000 telephone combination which, it is rumored, is about to be organized.

* * *

Electricity and Railroads.

In a recent edition of a New York newspaper there appeared an interesting article from the pen of Albert L. Johnson, entitled "The Trolley Age." The author took the stand that the steam railroad was practically doomed, and the near future would see this country covered with a network of high speed electric roads. Referring to the subject Mr. Johnson says:

"I say we must start afresh, from the ground up, discarding the cumbersome and expensive mode of operation now in use on the steam railroads. We must adopt the electric system, in which each individual car is supplied with its own motive power, and can be run as often as necessary, with nothing to earn beyond its own cost of operation, over a track honestly built and owned by a company capitalized for the actual cost of its plant, with franchise rights for which no money has been paid as tribute to the servants of the people. These servants have been placed in office by the people to subserve the interests of the people. Installation and security in a secure place does not mean that a public office is a private enterprise.

"I consider the electric system of transportation still in its infancy. What the future will bring forth no man can tell. But to-day it is a living fact, the speed and carrying capacity being limited only to the roadway and the power of the motor."

As an example, Mr. Johnson refers to the line that he is engaged in building between Philadelphia and New York, which will be provided with a roadbed conforming in every way to the highest standard in use by steam railroads. Commenting on the benefits to be derived by the adoption of electricity in lieu of steam, Mr. Johnson states that the cheap fare, frequency and accessibility of service, picking up and letting off of passengers practically at the doors of their homes, will create a volume of traffic which cannot be estimated. It will educate the city man by putting him in contact with his country brother. The former will get acquainted with the latter. One will learn the true details of the country and country life; the other will learn of the city

and city life. Both must be broadened and benefited.

The author concludes as follows:

"Thus far I have touched on the electric system, solely as applied to the transportation of passengers. The true function of the electric line is the carrying of both freight and passengers, not only between cities, but within the cities themselves, under conditions and at times that will not interfere with the traffic on the streets. With the proper roadbed and efficient motors, loads equaling the capacity of the largest freight cars can be handled quickly and economically by the electric system. Every car being an individual unit, capable of easy self-propulsion, can be sent singly forward to its destination, without the necessity of making up train loads in order to obtain the maximum load at the minimum cost of operation.

"In the beginning the freight business of the electric lines may be confined to package freight and the country products required daily for the support of the population of the towns and cities.

"Vested interests have ever been, in their origin, the parents of progress; in their maturity, its guardians; in their age, toll takers on its path."

The idea of converting steam railroads to electrically operated roads is no new thing, as it has been in the minds of many engineers for some time. The great drawback to the scheme would seem to be—as we pointed out in an editorial on January 26, 1898—that when it comes to equipping a trunk line railroad with electricity the interest on the large sums of money that would have to be invested in copper and in building power stations would be considerably greater than the cost of the fuel saved. It is true that since referring to this subject the three-phase method of electric traction has been developed and adopted to advantage on a number of lines abroad, but what would be gained in economy in such a system over the direct system, would be more than sacrificed by the well-known disadvantages that a polyphase alternating current system necessarily entails. In short, as we pointed out and demonstrated by figures over three years ago, electricity is as yet not well adopted to the operation of trunk line railroads in spite of Mr. Johnson's optimistic views to the contrary.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

THE Ohio Supreme Court has decided that street railroads have the right to carry freight.

A DISPATCH from London states that the Cunard Company has decided to install the Marconi wireless telegraphy on its ships.

THE General Electric Company has donated \$15,000 to the city of Schenectady with which to purchase a site for the proposed \$50,000 library to be erected by Andrew Carnegie in that city. The condition imposed by Mr. Carnegie is that the city appropriates \$5,000 annually for the maintenance. This has been met and the building will soon be erected.

A DISPATCH from Carlisle, Pa., to the N. Y. "World" states that "Daniel Drawbaugh, of Eberly's Mills, who claimed in the courts for

many years to be the inventor of the telephone, at the age of seventy-four has stumbled across an inexplicable electrical current of high potentiality. He has devised a small machine to demonstrate its existence. A private exhibition of the apparently new energy at Dickinson College on Friday last completely puzzled the scientific experts who were present. Mr. Drawbaugh's machine is very small, and is constructed similarly to the electro-magnetic apparatus found on telephone instruments. He turns on the positive and negative currents, subsequently short circuiting them, whereupon he draws another and an apparently unknown current from another part of the diminutive apparatus. The short circuited current and the third current combined make a powerful flow of electricity. Mr. Drawbaugh is at a complete loss to trace the origin of the power, and will build a new machine for further experiments at Dickinson College. Local experts declare that Mr. Drawbaugh has seemingly discovered a new and easy method of producing a strong electrical current, which will undoubtedly be of value in wireless telegraphic work."

THE Legislature of Minnesota has appropriated \$60,000 for the State University at Minneapolis, for the College of Engineering. Most of the money will go into the electrical laboratory and lighting plant.

AN interesting electric light buoy is now moored in the North Sea before Bunsum, in Holstein, to give warning of the dangerous sands at that place. Even a slight motion of the waves generates sufficient electricity for illumination, and clock-work in the interior regulates the half-minute lighting and extinguishing. Tests of this automatic light have proven so satisfactory that the extensive use of such buoys is predicted.

ELECTRICITY is used for cracking nuts in St. Louis, Mo., thousands of tons being submitted to that process annually.

It is understood that the deadlock between the two underground railroads, in London, is ended, and that a contract has been signed, by the terms of which both systems will be simultaneously equipped with electric power.

THE Miami and Erie Canal is to be equipped with electricity in the near future, a contract having recently been let for fifty boats to cost \$1,200 each. The power house will it is understood be erected near Hamilton, O.

AN apparatus for heating water for different purposes has lately been patented. The device consists, so it is claimed, of a series of pipes connecting inlet and outlet chambers, the pipes being covered with coils of resistance wire, and the entire warmer incased in a jacket of cement, which tends to aid in heating the pipes. With the switch which accompanies the apparatus the current can be turned into all or a portion of the wires surrounding the pipes to regulate the heat, as indicated by the names on the dial. The apparatus can be made in all sizes, and it is intended to use the heater in connection, not only with the stationary tank in residences, but also for travelers. With one of these heaters stored away in the trunk the traveler need never worry about not being provided with hot water at the hotels, as all that

is necessary is to attach a socket in place of one of the incandescent electric lights, when a turn of the switch will run the current through the wires and heat the water contained in the chambers.

THE President on Monday appointed Edward B. Moore of Michigan, to be Assistant Commissioner of Patents.

THAT the Bell monopoly is making money may be inferred from the fact that Frederick P. Fish, its newly-elected president, is to receive a salary of \$100,000 a year. Might it not be a good idea to reduce rates slightly and salaries proportionately?

A TRIAL of storage batteries for automobiles is being arranged to take place on June 1 next, at Paris, under the auspices of the Automobile Club of France. The trials will be made to ascertain the efficiency of the batteries submitted.

THE site has been selected on Barclay Sound, West Vancouver Island, for the landing place for the Pacific cable. It consists of one hundred acres, and will be laid out as a town and cottages built for employees.

THE purchaser of the plant heretofore in use by the United Light and Power Company of Georgetown, Col., for supplying electric power on the new tunnel into Covode Mountain will not only furnish the needed supply for all company purposes, but will provide also for the extension of an economical motor to many of the operations on Silver Mountain. Ample water is available at all seasons of the year, to insure against a resort to steam for maintenance of power, and the consequent saving in cost to the consumer will induce the early adoption of electricity at the leading mines.

THE Detroit, Mich., Romeo, Rochester & Lake Orion electric suburban line has decided to make a strong play against the regular steam railroad lines running from Detroit to the various points which it covers in conjunction with them. The electric line schedule is slower than the steam line, but to prepare for the comfort of its patrons it has ordered special cars which will feed the passengers of the road in route from Detroit to the various summer resorts and suburban points on its line. It proposes to cover this new feature of suburban traffic by having the conductors solicit the passengers for breakfast, luncheon and dinner orders on the various cars and having these orders supplied from the proper stations along its route.

PRESIDENT L. R. Adams of the Automobile Club of Long Island and A. Ward Chamberlain of the Automobile Club of America on April 18 traveled over the hundred miles that is to be the scene of the endurance test of the Long Island organization. Ninety-five direction signs were placed along the route by employees of the club in the course of the day, and there is little danger of competitors losing their way over the course. The steepest road was found to be on a hill near Roslyn, L. I., where, in the Wheatley Hills section of Long Island, the grades are very steep. A change in the course is announced. At Douglaston, L. I., the route will go northward into Great Neck, and the North Shore again will be taken up at Manhasset. From Hicksville, L. I., the route has

been changed, and will run through Farmingdale to Amityville, L. I.; thence to Massapequa by way of Central Park. The start and finish will be at Jamaica. Competitors from all parts of the country are here for the test, which promises to be one of the greatest trips and events in the new pastime ever known.

THE storm which raged last Saturday and Sunday worked great damage to telegraph lines in and around Chicago, so much so that communication between New York and the Windy City had to be made by way of Montreal.

NEW YORK exporters will no longer be required to affix revenue stamps to export bills of lading. Charles H. Treat, Collector of Internal Revenue for New York, made the announcement Saturday. New York exporters claim that they have paid \$40,000 in such revenue during the three years the act has been in effect. It has been declared unconstitutional, and the \$40,000 will be refunded.

ANOTHER connecting link in the trolley line from Philadelphia to New York was secured last Saturday, when the Trenton, Lawrenceville and Princeton Railroad was formally transferred to the syndicate headed by Albert L. and Tom Johnson.

THE system of trolley lines which was equipped by the United Tramways Company of London, England, but has been delayed getting to work for fear of interruption being caused to the magnetic instruments at Kew Observatory, is now in full swing, the objections having been somehow or other removed. It is stated that the delicate instruments which have been the cause of the trouble are to be removed where electric tramway currents are not likely to trouble them. This is the first electric trolley line to be operated upon a public way, either in or near London. Many miles of extension are being equipped for electrical service.

OWING to the number of companies advertising in America to sell stock in wireless telegraphy and telephone companies, on which large dividends are promised, Mr. G. Marconi, before sailing for Europe on the steamship Campania, requested his counsel, Mr. E. H. Moeran, to cause the publication of a letter, in which Mr. Marconi denies that he is associated in any way with any American company, having for its object the development of wireless telegraphy in this country.

HERR EWALD RASCH describes in the "Elektrotechnische Zeitschrift" for February 14, an arc light, says the London "Electrician," obtained by the use of solid refractory electrolytic electrodes which have to be heated to start with as in the case of the Nernst lamp. With electrodes 2.5 mm. diameter a pressure of 50 volts and a current of 2 amperes, 630 Hefner candles (horizontal) was obtained, and with electrodes 5 mm. diameter and 5.3 amperes at about 42 volts, 900 candles was given out, or about 4 candles per watt in each case. Experiments were made with 2.5 mm. electrodes, varying the current; with 1.1 amperes at 65 volts the candle-power was 146, the current was then gradually increased to 5 amperes when the voltage dropped to 45 and the candle-power increased to 1,012, but at this stage the electrodes fused; in fact, it was advisable for steady

working to keep the efficiency down to from 3 to 4 candles per watt. The author points out that Tumirz, in his paper "On the Mechanical Equivalent of Light," gave the ideal efficiency as 5.21 candles per watt, and as a result of these experiments it was found that the highest efficiency obtained was 5.2 when the metal fused. It must, however, be pointed out that the electrodes become convex so that probably the greatest illumination would be horizontal, and no tests of the spherical candle-power are given in the paper. Dr. W. Nernst, referring to this article in the "Elektrotechnische Zeitschrift" of March 21, attaches considerable importance to this point, which he considers militates against the practical employment of Dr. Rasch's electrolytic arc, and makes its efficiency no longer phenomenal. He further remarks that no figures are given in Dr. Rasch's article for rate of consumption of the electrodes. His own experiments with electrodes of a material similar to that employed in his incandescent lamp, showed that the negative and not the positive electrode burns away the quicker (a phenomenon which he thinks may have an important bearing on the theory of the arc) and that the quick consumption would prevent the construction of a practical lamp on these lines.

A RECENT mishap in Liverpool, where a live wire trailing on the ground after disconnection made considerable havoc, has led an inventive Englishman to devise means to prevent its recurrence. Ordinary overhead wires are provided with a fuse which should melt when a breakdown occurs, but, as was shown in Liverpool, this expectation is not always realized. The Englishman's invention is a secondary circuit. It is above the main cable, alongside the companion wire, but is insulated from the main cable. In the event of the main cable becoming broken an automatic switch connected with the companion wire would be operated in the main station to disconnect the circuit from the main cable.

BALTIMORE advices say that plans are well advanced in the formation of a new and large security holding company, with a total authorized capital of \$5,000,000, which will make a specialty of controlling, operating and constructing street railways in various cities throughout this country. The proposition to consolidate the street railway lines in San Francisco is one of the enterprises in which the new company is interested. It is understood from an authoritative source that the enterprise will be very broad in its character and that offices will be opened not only in Baltimore, but in New York and other leading cities.

Now that the time has come when electricity can be conveyed over a wire and utilized at a distance of many miles from the point of development its practical possibilities have been greatly increased. A swift mountain stream or a cataract may be made to yield up its power, and this power may be transmitted without material loss of energy to towns on the plains where it has great value to man. The success achieved along this line in California is of genuine interest, and electricity carried over short distances is finding new applications constantly. The most recent of these is in pumping water to irrigate arid lands. Several installations of this kind have already been made.

ARTICLE NO. 24.

THE TELEPHONE AND TELEPHONE PRACTICE.

(Continued.)

All central exchanges should be equipped with accurate and convenient means for testing lines and circuits so that, if at all possible, the trouble on a circuit may be determined and located before sending a trouble man out, as a great saving of time by this means can be secured. There are very few exchanges, outside of those in large cities, thus equipped and it is surprising the slow, old-fashioned means for doing this work that are still indulged in.

How often we have seen the inspector, when a line is in trouble, take down the hand magneto, hanging conveniently by, with a couple of flexible cords attached and connect it to the line. If the bell will ring the line is O K and if it will not ring it must be open. This is the full extent of the test.

In this article I will describe a simple and effective testing outfit and circuit that can be used on any system.

A central exchange should be supplied with a testing table equipped with the following apparatus: A low-reading voltmeter, a reversing key, a test battery, a ringing key, a talking set with a switching key for throwing the line from the test circuit to the talking circuit, and a simple means for connecting the test circuit to any line so that the line may be tested outward towards the substation with the switchboard circuit disconnected and also to test the circuit toward the switchboard with the line disconnected. This can generally be arranged by having suitable terminals at the cross-connecting or distributing frame.

If the exchange be of the common battery type the same battery which operates the system may be used for testing with, but if it is a local battery exchange a number of cells of primary battery aggregating about 15 volts should be provided for use in testing.

Fig. 1 describes the arrangement of the apparatus and circuit, B the battery, grounded at the negative pole, V the voltmeter, S strap key, R reversing key, L the listening key for throwing the line from the test circuit to the test operator's telephone and X the ringing key. In a small exchange the ringing key is not necessary and the test operator may use a generator on his telephone for ringing. The ringing key is only provided when the "power" generator is used in the exchange, then it is very convenient. If keys such as are described in the figure cannot be secured, then four point strap switches (Fig. 2) can be used in their place. PP represents the test cord or lead which may be attached to clips or some other convenient means for connecting to the line terminals.

This circuit as given is the plain, simple necessary circuit and may be extended however by an ingenious telephone man to include extra apparatus convenient for different purposes. After arranging a testing outfit as just described, a piece of paper, semi-circular in

form, should be pasted on the voltmeter directly above the dial upon which should be marked a resistance scale. To arrange such a scale, first connect the voltmeter directly across the battery to be used for testing and at the point indicated by the voltmeter needle mark on the paper 0 (zero). Then connect a "bridge" resistance in series with the voltmeter so that any known resistance may be cut in series with it. First cut in 100 ohms and note the point there indicated by the needle and mark it 100. Repeat this proceeding, adding an additional 100 ohms each time and marking the point where the needle rests until as much as you wish of the entire scale is marked off in this manner. You can readily see the advantage of this, for if a line is being tested the position of the needle will indicate approximately the resistance of the circuit without the operator having to figure this out from a formula.

In the operation of testing with this test circuit connected to a line note as follows. If one side of the line be grounded you would get a reading on the voltmeter with the reversing key R thrown in one direction and no reading when thrown in the other. If the two conductors of the line be connected together through the ringing coils of a telephone bell, as they usually would be on general system work, then the side of the line which was grounded would be indicated by the highest reading, as on the other side there would be the added resistance of the bell in the circuit of the volt-

are crossed together the resistance of the cross, as indicated by the voltmeter, will show whether the lines are "dead" crossed or closed together through a telephone. If one side of a line be open and the other grounded you would get a reading on one side to ground and no reading on the other, either with or without the strap key S.

If a circuit is being tested which has a condenser in series with the bell, as in common battery systems, the charge and discharge of the condenser will be indicated by the voltmeter needle giving a momentary deflection when the strap key is kept closed and the reversing key worked back and forth.

To determine whether there is a loose connection on a line or not, hold the strap key closed and allow the current to flow around the circuit. If the needle varies it will indicate such to be the case. If there is no variation in the current before the subscriber comes in on

the line, and there is after he does, that will show that the loose connection or poor contact is in the subscriber's instrument.

There are very few troubles about a line or instrument that an experienced operator, handling a test circuit such as just described, cannot determine what they are and in most cases locate them before sending a trouble man out to clear them.

Article No. 25 will be entitled "The Telephone and Telephone Practice" (continued).

HINTS FOR ENGINEERS.*

BY H. W. WAKEMAN.

An asbestos plug cock makes a very good blow-off cock. Engineers used to argue concerning the advisability of turning the plugs of these cocks more than one-quarter revolution, but such discussions were suddenly cut off by the appearance of plugs that could not be turned more than 90 degrees.

Many of the valves found in modern steam plants have removable disks, so that when one leaks it can easily be repaired. A supply of these disks should always be kept on hand, as it may not be convenient to buy one when it is wanted.

When an engine runs "under" it always has an awkward appearance.

If you are not paid as much money for running your engine as you consider the job worth, do not fail to keep the plant in first-class condition, for visitors will not stop to inquire how much salary you receive.

When calculating the speed of an engine, begin with the governor pulley, just as if it were the driving pulley on a shaft.

If it is necessary to use the common globe check valves when piping up a steam plant

*From the "Wood Worker."

meter to ground. If both sides of the line be grounded you would get a reading on both sides or in either position of the reversing key. If the lines be crossed together but not grounded the voltmeter would give a reading only when the strap key S was closed. If both sides of the line be open and clear there would be no reading whatever. When two conductors

use one size larger than the pipe, as they will work with less friction.

Leaky boiler seams should never be calked with steam pressure on the boiler.

One hundred pounds of wood are equal to forty pound of good coal, so far as steam-making qualities are concerned. A cord of hickory wood is worth much more than a cord of chestnut, but the latter does not weigh as much as the former, so that for equal weights, their value is equal. It is assumed that the wood is thoroughly seasoned.

Before you attempt to carry your indicator box away by the handle, be sure that the lid is locked or hooked, as otherwise you may find the indicator on the floor.

An injector requires steam for its successful operation; hot water will not answer the purpose.

Ground joints on cylinder heads of steam engines are good things, as they save packing and trouble, but they must be used carefully when taken apart, as it does not require much to make them leak. Before they are put together both surfaces should be well cleaned, and treated with cylinder oil.

Locate the blow-off valve as near your boiler as possible.

Plumbers often use wax for making joints on gas pipes, in order to prevent leaks, but red or white lead will do for ordinary work; if there are small leaks the joints may be varnished.

When fitting up a water tank for use in the upper story, or perhaps on the roof, locate the outlet pipe in the side near the bottom. Do not let it project on the inside, but have it funnel-shaped, with the inner end flush with the inside of tank. That is the way to secure the greatest efficiency; in other words, the proper way to get the most water through the pipe in a given time.

When an engineer thoroughly understands the machine that he has charge of he has made a good point, but he cannot claim to be well informed in the business until he has a good working knowledge of several other kinds. He should also study up the man who owns the machine he is running, for failure to do this may result in complete dissatisfaction, when he in reality is a competent engineer.

When it is desired to connect into a pipe, say two inches or less in diameter, it is frequently cheaper to break a cast iron L than to disconnect several joints.

If you intend to use a heavy cylinder oil in a cold place, buy a downward-drop lubricator.

Be sure to close the drip cocks on your engine when it has attained full speed.

The tensile strength of a rivet is usually much greater than its shearing strength, but this is counterbalanced by the fact that when two boiler plates are riveted together, the friction which must be overcome before they can be torn apart is very great.

Do not roll sheet packing into a bundle of small diameter, but spread it on a broad shelf.

Some pumps have hand levers to start them with in case the valve gear fails to work, while others have none because it is claimed that none is needed. I prefer the former.

It is a good plan to let your engine exhaust into your heating system, but it is not necessary or advisable to have the inner surface of the pipes coated with the dregs of cylinder oil. It is well to put a separator in the exhaust pipe and locate it near the engine.

Do not do anything to discourage yourself. This means that if you are an engineer, striv-

ing to keep an old plant in good order, do not count the hours you work each week (unless you are fortunate enough to be paid by the hour), for they may mount up to an alarming figure and so operate to dishearten you.

Heating by direct radiation means that the radiators are located directly in the rooms to be heated.

Resin makes a very poor belt dressing.

Do not attempt to tighten the nuts on a flange coupling under steam pressure.

What a great number of reasons are given for boiler explosions as we hear of them from day to day! If all were correct it would prove a steam boiler to be a very complicated and unsafe thing to handle, or work around, but fortunately some of these reasons do not exist outside of the fertile brain of those who exploit them for their own benefit. A boiler explodes because it is not strong enough to stand the pressure that is put upon it, and that covers the whole ground. The boiler may be new, with defects that render it at once unsafe, and when working pressure is put upon it there is trouble, or it may be old and gradually grow weaker until it fails under an ordinary pressure. Of course, it takes an experienced engineer to tell when it has become unsafe, but there is nothing supernatural about it, as some people would have us believe.

THE APPLICATIONS AND REQUIREMENTS OF A PRINTING TELEGRAPH.*

BY ROMYN HITCHCOCK.

Many efforts have been made by inventors to produce a practical printing telegraph which will supersede the Morse key in the telegraph business of the world, and many failures and disappointments have resulted. It is not an unusual experience that inventions of great ingenuity and apparent value have been perfected at large expenditure of time and money, only to discover that they are not wanted in the commercial world. We hear much of "the state of the art" whenever new devices are brought forward, but the state of the art, as shown in the records of the United States Patent Office, may be quite different from the conditions which prevail in practice. Inventors are by nature optimistic. They are not, however, usually able to accurately gauge the conditions under which their inventions must compete with existing devices. Superiority in certain directions may be offset by conditions which are practically prohibitory of the application of improvements which effect minor economies, although in the aggregate the saving may be large.

The writer has followed the development of the printing telegraph for many years, and while recognizing the value of a thoroughly good, cheap and reliable device of this nature, for special applications, there are obvious and good reasons for believing that it can never be introduced for the general telegraphic work of the great companies. The most that can be said in favor of the general use of a printing telegraph is that it practically doubles the speed of transmission by the Morse key. The further claim is made that it will reduce the cost of operating by permitting the substitution of typewriters for expert telegraphers.

Regarding the increase in speed, the advantage is not sufficiently great to be attractive in itself, particularly when the considerable cost of the instruments and keeping them in order

*From the "Telegraph Age."

is taken into account. The direction of improvement in telegraphy is certainly above all in an increase of speed of transmission; but this increase must be very much greater than the printing telegraph, by reason of its mechanical and electrical limitations, can ever realize. Machine transmission, at a speed far beyond any system now in use, is destined to be the great universal system of the future.

Regarding the plausible argument of economy in operating, this is illusory, because of the erroneous assumption that a general telegraph business can be successfully conducted by untrained operators. Granting that the parsimonious methods which characterize the present telegraph monopoly in the payment of faithful employees leads to a large average of inefficiency and loss of time, all important lines, on which service must be maintained under the most adverse conditions, are necessarily in charge of experienced men, and the introduction of printers on such lines would require equally good if not superior qualifications in the operators, who would have more than a simple key and relay to control. This is particularly true when the printers are duplexed, as they would necessarily be for this service. The balancing of the line for duplex working would require about the same skill as now is demanded of quadruplex operators. It is likewise doubtful if competent typewriters could be secured for the same low wages that the Western Union now pays for ordinary Morse operators.

For these and other reasons, which the practical telegrapher will immediately recognize, the printing telegraph operated from a keyboard can never compete with the Morse key for general telegraph service. In reply to this it may be said that the old Hughes printers is still used on several British lines, and the Baudot system is used in France. While these systems may be referred to as indicating the practicability of operating printing telegraphs over long lines, they do not meet the requirements for universal application. A close inquiry into the reason why the Baudot system is used in France will indicate that the intrinsic merits or advantages of the system are not the only considerations.

Nevertheless, a printing telegraph which fulfills certain specific requirements would doubtless find use on particular lines operated by the telegraph companies, and especially on certain railroad lines. At stations where the operators are required to be frequently absent from their posts on other business, the printing telegraph can be so arranged that it will receive messages while no one is present; at least it will be unnecessary to have a regular telegraph operator at every insignificant station on the line, since any person can quickly learn to use the apparatus.

However, telegraphers need not have misgivings concerning the introduction of the printing telegraph. A few of them may be changed about; but the way is opening for a large expansion of the telegraph service, and experienced telegraphers will not only be more and more in demand, but their services will be more adequately recompensed than they are now.

A much larger field for the printer is in connection with the telephone, or in the line of special wire connections between offices, factories, warehouses and homes. This field is not yet occupied by any similar device. It is virgin ground, unexplored and undeveloped. But it

has its possibilities. Some years past the writer was in London, and in conversation with a gentleman connected with the telautograph was much interested to learn of an important use which has been made of that ingenious invention. A certain piece of machinery was wanted immediately and the factory was located a long distance from the business office in the city. Ordinarily some hours would elapse before the order could be delivered at the factory, since it was necessary to submit a diagram. Having telautograph connection, the order was immediately written on the machine and the diagram drawn out and sent over the wire. The printing telegraph will not make the diagram, but otherwise it fulfills the purpose which the telautograph was intended to accomplish, and for which it was confidently believed that admirable invention would be largely used.

However perfectly the telautograph may operate, it is too slow for general commercial use. No person will write when a typewriter can be employed, and the relatively few cases in which fac simile signatures are necessary in wire communications scarcely warrant the hope of a very general use of the telautograph.

The introduction of the printing telegraph in connection with the telephone, however, is eminently practical and offers an attractive field for enterprise. Verbal communications are not always satisfactory to either party. Frequently they are subject to confirmation by letter, and perhaps the letter never comes. While the line is in use for speaking one may say "Please put that down in writing," and forthwith the telephone is switched off and the printing telegraph is switched on, and the writing is done. Moreover, if a man is absent from his office, a message can be recorded on his printer, which may be securely locked in his desk. There is thus no waiting to be called up when some one returns to receive the communication.

The "state of the art" in printing telegraphs, as revealed by the Patent Office, shows great activity and ingenuity. It is quite evident, however, that most of the inventors have entered the field without a very clear conception of the most serious obstacles to success. The first question asked of an inventor when he has completed his machine is, "Will it operate over a telegraph line?" The assumption is that if it will operate over a line the problem is solved. And so it is, but the practical difficulties in producing a printing telegraph are not, as might be and usually is inferred, in the line operating. Experienced telegraphers can meet any reasonable exactions in the line working, and the real difficulty is not in the line requirements, but in the printing mechanism. Here, then, is the stumbling block which has blasted the hopes of a multitude of inventors.

For a clear understanding of the requirements, we should separate in our minds the line working, which pertains to telegraphy, from the printing mechanism, which usually is, or at least may be, a separate contrivance designed to operate with such impulses as the telegraph line transmits. One great reason for the failures in this field has been that almost every inventor has undertaken to construct a printing mechanism of his own, while the real merit of his invention is in the transmission of electric impulses and the distribution of them at the receiving end. The man who can accomplish this in the best way

is not usually the sort of man who can design a printer, and the less he meddles with this part of the work the more quickly his invention will take practical form. For demonstration of his system an ordinary typewriter, in the absence of anything better, will suffice, and when this has been accomplished a suitable printing mechanism must be adopted.

It is a problem with which many keen inventors have wrestled, and some wonderfully complex and delicate, but not very satisfactory, contrivances have been evolved by experimenters. Therefore, it is assuming too much to suppose that one has only to give an order to a mechanic and he will forthwith evolve a practical printer. Inventions cannot usually be made to order. To one who knows what is necessary in this connection, and who is acquainted with some of the past efforts, the supreme confidence with which inventors undertake to accomplish results, each for himself, regardless of what others have learned, is not indicative of a clear conception of the difficulties to be overcome. Much time is often wasted in projecting new devices without regard to the experience of others. Inventors generally, and many mechanics, are abnormally sensitive to the least suggestion of a limitation to their ingenuity or skill, and a proposal to refer to the work of others is likely to be received with great disfavor. But it is the part of wisdom and a broad knowledge of men and affairs to combine past experience with the best special skill to accomplish a result.

No printing telegraph can be successful which operates a commercial typewriter. The nearest approach to a successful machine of this kind seems to be the Himrod printer, in which the mechanism of the typewriter is actuated through the medium of compressed air. But the Himrod printer was handicapped by a keyboard with two shift keys, and a method of manipulating the shift key which was confusing to an inexperienced operator. The objection to a typewriter machine is that it requires too much power to operate it. From a superficial view the power for printing is quite independent of the line impulses, since the relays have only to complete circuits from local batteries, which may have currents of any required strength. But practically the relay contacts restrict the amount of current which can be carried within comparatively narrow limits, and, moreover, the duration of the contacts must be sufficient to enable the mechanical movements to be perfected. For this reason the typewriter imposes limitations in speed, and while it is possible to operate under favorable conditions as rapidly as the keys can be used in practice, the margin of effective work is too near the limit of practical requirements to admit of absolute reliance.

No system of printing which involves synchronous movements at distant points can be universally successful, and there are serious objections to any system of multiplexing which gives the line to different writers in succession. Perhaps the greatest defect of such systems, apart from their liability to be interrupted by line disturbances, is the necessary limitations they impose on the duration of contacts. Whether the combinations transmitted for each letter are many or only three, if we are to insure the greatest possible effectiveness and certainty of working, they should not be of uniform duration, since the last impulse should always be made as long as possible to allow for the mechanical work which has to

be done in striking the letter. The whole problem now is, to reduce the force required to do this mechanical work. Here is the one remaining element of weakness in the printing telegraph.

The use of the printing telegraph can be greatly extended in the general telegraph field if the transmission can be made very much more speedy. Machine transmission, with a printer that will operate at a speed of a hundred words a minute as a minimum in each direction, while working duplex, would bring the system into rather close competition with the Wheatstone, with corresponding advantages of considerable value. The Buckingham machine is operated in this way, but it is difficult to understand how that rather complex mechanism is able to transmit words with the speed claimed for it. If that machine works at the rate of one hundred words a minute, with six impulses over the line for every letter and space, then it is assuredly possible, with other means, to greatly exceed that speed of transmission and printing.

In the writer's opinion, not much can be accomplished by new inventions in the direction of improving the purely telegraphic part—that is, the line working and the local receiving and distributing systems—of the printing telegraph as it stands to-day. Improvements will doubtless be made in minor mechanical details, but the broad principles of operating are doubtless as well worked out generally and as much simplified in principle as is possible.

What is now required is a simple printer to which these principles can be applied. Here is a field for inventive genius. The man who can make the simplest practical mechanical page-printer, to work like a typewriter, and which can be operated with the least possible power at a speed of more than one hundred words a minute, will deserve a rich reward.

In some telegraph systems the printing mechanism is an integral part of the local distributing devices. To these an independent printer would not usually be applicable. But with all those systems in which the last line impulse perfects a combination to operate a key or a printing lever it would be of use.

The tendency of the day in science and the arts is toward specialization. The best and surest progress is made when work is done by men having special qualifications for it. If the construction of a printer for telegraph use is taken up by skilled mechanics, we may anticipate an early solution of the problem which has thus far baffled the inventors of printing telegraphs.

Transformer of High Potential Difference with a Cathodic Voltage Raiser.

M. P. Villard brought to the attention of the French Physical Society, at a meeting held on March 9, a transformer made by the Carpentier firm, which had an efficiency of 50,000 volts in the secondary, derived from 110 volts in the primary circuit. The secondary circuit contained two condensers embodied in the apparatus and modifying the circuit to remove all danger. The limits were determined by a "cathodic valve" which absorbed one of the alternations, leaving only the difference of potential almost equal to that of a Ruhmkorff coil. The other electric alternation which can not get through the valve is used up in making electric sparks. This arrangement gives the remarkable effect of raising the voltage of the available alternation. Without utilizing the

valve the sparks do not exceed 9 to 10 centimeters in length, but when the valve is in use the sparks are 18 centimeters between the ball terminals and 24 centimeters in length between pointed terminals.

PARIS LETTER.

Special Correspondence of *ELECTRICITY*.

Electrical Oscillations from the Nerves.

At the meeting of the Academy of Sciences of Paris, March 11, M. d'Arsonval presented a communication from M. Carpentier of Nancy, relating to the nature of electrical oscillations that are produced through the medium of a nerve which is electrically excited during a short period of time. It was demonstrated that a short electrical excitation produced a double transmission on the part of the nerve of an alternating current; positive during half of its period and negative during the other half.

The Metropolitan Railway of Paris.

The subscription to the new shares of the Metropolitan Company, which has recently opened, has been a great success. This is due to the constant increase of the company's receipts, which continue at present to be very great. During a period of six days the company has collected 153,556 francs. In one day the line carried 113,868 passengers. There are at present 626 trains in constant service, which average 32.94 per hour. There are 2,504 cars, which means 131.78 in use per hour. The total distance traveled by these cars is 6,447.8 and the receipts per train kilometer have increased until they have reached 6,324 francs. The company is now meeting all of its expenses, including the payment for franchise services to the city, and shows a net profit of 27 per cent. on the gross receipts. This profit will certainly be larger when the preliminary expenses have become normal over the whole length of lines for which concession has been obtained, for it must not be forgotten that there is only one line, the Vincennes-Porte-Maillot, being at this time in service.

An Electrical Theft.

It is a well known fact that electrical meters are working very badly, and that there are a large number of errors which the consumer considers when his bill is presented at the end of each month by the company for current consumed that leads to considerable wrangling. This condition of affairs had the effect of very much exciting one Mr. S. of Paris who looked for a remedy for the constantly growing increase of his ordinary constant consumption of current. He conceived the idea of boring a hole through the door of the meter, and of inserting a screw-eye for the apparent purpose of hanging up his consumer's note-book, but after the company's agents had made their inspection and noted the reading Mr. S. took the screw-eye out and inserted in the hole a long needle which paralyzed the motion of one of the smaller working parts of the apparatus in such a way as to cause a smaller reading, so that the greater the consumption of current the lower became the bill to be paid at the end of the month. The official of La Place Clichy was notified by a neighbor of Mr. S., and the company's agents prepared a trap for him, composed of two movable contact pieces placed in the meter-box, and so constructed that the east push through the hole brought the pieces

in electrical contact with each other, and thereby establishing a short circuit. The trap was no sooner installed than Mr. S. again commenced his operations with the immediate result of a violent blinding flash of light. Mr. S. went to the official to complain of this startling phenomenon, and was very much alarmed by the way his meter was operating. They tried to calm him, but complaint was made to a court of justice and after a lawsuit the Tenth Chamber sentenced Mr. S. to three months in jail and to pay a fine of 300 francs, and two official announcements in the public press.

Electric Traction in Paris and its Suburbs.

There are a considerable number of Parisian tramway companies, there being not less than 12 who operate altogether 76 lines of which 23 are horse lines and 53 operated by mechanical traction. Franchises have now been granted for 590 kilometers, of which 420 belong to the latter class. In 1898 there were only 291 kilometers of street railway of which all were operated by horses except 84 kilometers. It is plainly to be seen the rapidity with which this growth has taken place during the last two years. Seven lines are operated by compressed air motors, steam motive power with different

velli surface contact system, of which there is one line in the Bois de Boulogne.

The Diatto system operates under an 80 kilometer franchise, but it undoubtedly will be annulled before long on account of the numerous accidents which are continually taking place, and has been previously brought to the attention of your readers in one of my previous letters.

ELECTRICAL EFFECTS ON THE PAN-AMERICAN MIDWAY.

BY FRANK C. PERKINS.

With the approaching day of opening the Pan-American Exposition grounds are rapidly assuming a more attractive appearance, and it is with pleasure that the Exposition officials announce that, notwithstanding the contrary statements which have appeared, the buildings and exhibits will be in a more nearly completed state than any of the recent expositions at Paris, Omaha or Chicago.

From the tower at Niagara Falls an enormous searchlight will be used and the Horse Shoe and American Cataract will be brilliantly illuminated with white and varying colors. The scene will be indescribable, even exceeding the wonderful effect of the whirlpool

HIGH POTENTIAL WORK AT THE PAN-AMERICAN EXPOSITION.

systems of boilers operate ten lines and there is only one using cable traction and four are operated by electric motors.

First—Accumulator traction is used for seven tramway lines in Paris and is in competition with the overhead trolley running outside of Paris to Clamart, to Malakoff and to Neuilly, etc.

Second—We have the Canivcan underground system operating two tramway lines, Montparnasse to l'Etoile and to the Bastille. These are in competition with the overhead trolley running outside of Paris to St. Ouen and to Villemonble.

Third—The overhead trolley system is allowed only outside of the fortifications and is used for operating or will operate over 31 lines, of which only 10 are now in actual service and are to be taken into consideration. The others are under process of construction.

Fourth—The Diatto surface contact, of which there are 8 lines in Paris, and the Vedo-

and rapids in the Niagara Gorge of last season, when illuminated with searchlights and colored lights. The Observation Tower searchlight will be supplied with current from the power house of the Niagara Falls Hydraulic Power & Manufacturing Company, and the light from this projector will be observed more than 50 miles away, but it is believed on account of the great height of the tower that the Exposition, which is 22 miles away, is easily within its range.

Its powerful rays will be met by those of two 30" projectors on the Electric Tower at a height of 350 feet from the ground. These searchlights will require a current of from 75 to 100 amperes at a potential of about 50 volts. These powerful beams of light from the tower will illuminate the various groups of statuary about the grounds, and give the visitor a bird's-eye view of the Pan-American Midway from the tower.

The many features on the Midway utilizing

electricity extensively in their various effects, are the "Trip to the Moon," "Darkness and Dawn," "House Upside Down," "Dreamland," "Hawaiian Volcano," and the "Aerio Cycle." What the Ferris Wheel was to the Chicago Exposition, the "Aerio Cycle" will be to the Pan-American Exposition. It is the altitudinous wonder of the Midway. At each end of a structural iron beam, which in operation is remindful of the "teeter" of boyhood, is a revolving wheel in which four cars are hung after the manner of the Ferris Wheel. These cars are operated by 40 horse power electric motors. When one wheel is down taking on and discharging passengers, the other is revolving 275 feet in the air. Two powerful searchlights will be used from the axis of each wheel, while the "Aerio Cycle" will be illuminated by more than 2,000 incandescent lamps operated by current from Niagara.

The electric launches will be operated as in Chicago from the concession "Venice in America," while the other features above referred to will use electric projectors, chasers, electric

plates of glass. The discharges are varied up to 250 per second.

The line potential has been raised from 11,000 volts to 22,000 volts, and many of the static step-down transformers are already in position in the Electricity Building for converting the high tension Niagara Falls current to a moderate tension for distribution about the grounds and to the various buildings. The Electricity Building has been ready for exhibitors for some time past, as well as the Machinery and Transportation Building and others in different parts of the grounds. Little fear is entertained by the officials but that the opening and dedication exercises will occur as scheduled.

TRAIN LIGHTING BY ELECTRICITY.*

BY PROF. GEO. D. SHEPARDSON.

Attention may be given to the various parts of the axle-lighting systems, noting how different engineers have attacked the difficult problem. The mechanical connection between the car axle and the dynamo is a much simpler

car axle and geared to it by a 41 reduction gearing. A somewhat similar arrangement was used for a while by the American Railway Electric Light Company in 1897, who fitted a split sleeve over the car axle, to carry the gear and dynamo journals. The first equipment put out by Moskowitz, in 1893, on the Central Railway of New Jersey, had a sprocket wheel on the car axle, from which a chain drove a countershaft with a cone pulley driving the dynamo, which was in one corner of the baggage car. The sprocket was abandoned and the dynamo was then mounted on the car truck with a friction drive, which in turn was replaced by a belt drive with countershaft hung with tension springs. With any kind of a belt drive it is necessary to use wide flanged pulleys on account of the up-and-down and endwise motion of the car axle and on account of the swinging of the truck in rounding curves. In the Stone system, largely used in England and Europe, and in its American representative, the Gould system, the dynamo is hung on the car body with links and tension springs. The system put out by the Consolidated Railway, Electric Light & Equipment Company, which has consolidated the Moskowitz interests. National Electric Axle Light Company, the Electric Axle Light & Power Company, the Columbia Car Lighting Company and the United Electric Company, uses a peculiar belt with V-shaped links working in grooved pulleys, the dynamo being mounted on the car truck with a spring tension device.

To protect the axle-lighting outfits from the weather, the dynamo is generally made iron clad and weatherproof, so that externally it looks like a tight box. The difficult part to protect is the belt, or gearing; in the case of a dynamo hung on the axle, the gears or friction drive may be inclosed in a dust and oil tight metallic casing, as is common on street railways. Where a belt is used, some sort of flexible casing is desirable. The batteries are placed in boxes hung under the car body, having removable fronts, and having suitable ventilating openings for the escape of the gases which arise during the charging of the batteries.

The regulation of the voltage with the varying speeds is one of the most difficult problems to handle. One method of keeping the voltage at the lamps constant while the speed of the train varies, is to secure a variable ratio of reduction between the car axle and dynamo. Below a certain limit of speed of train it is impossible with any system to maintain proper operation of the dynamo, and some automatic device must be provided to cut the dynamo from the battery and lamp circuit below the critical speed. Above this speed the dynamo may be kept at constant speed by means of friction cone pulleys, as was done by Barrett and by Moskowitz. The plan of Stone, in England, and of Gould, in America, is to maintain the speed constant by allowing the belt to slip; if the speed of the dynamo increases, the voltage also increases, and this makes the current through the battery or lamps increase correspondingly, but the pull on the belt is closely proportional to the current from the dynamo armature, hence the higher speed of the dynamo involves a greater pull on the belt; now, it is not difficult to adjust the tension of the belt so that it will slip more or less and pull the armature just hard enough to deliver the desired current and no more.

A more common method of securing constant

HIGH POTENTIAL WORK AT THE PAN-AMERICAN EXPOSITION.

stereopticons, and numerous motors, fans and focusing arcs in producing the mysterious sensations on the airship "Luna," in the City of the Moon, the caverns and grottos in the representation of "Dante's Inferno" revised and up to date.

Probably the effects produced in "The Johnstown Flood," "The Hawaiian Volcano," and "Hell up to Date," could not have been made so effective without the present high tension current now available, and the storm, thunder and lightning effects would not be possible.

One of the most interesting and startling features at the Exposition will be the high-tension experiments produced by Mr. C. E. Skinner of the Westinghouse Electric & Manufacturing Company, and Mr. Paul M. Lincoln, superintendent of the Niagara Falls Power Company. The enormous pressure of 40,000 volts is required to produce the most brilliant effects in their demonstration, which produces a wonderful imitation of a thunderstorm with lightning effects, which are truly wonderful. The accompanying illustrations show a few of the effects produced by lettered signs of heavy

problem in Europe, with rigid car basis, than in America, with four or six-wheel swiveled trucks. In Europe, it is usual to mount the dynamo on the car body, for the car axle is always practically at right angles to it. The power is generally transmitted by means of flat belts of link or solid leather, or of camel's hair. On one car of the Paris, Lyons and Mediterranean road the pulley on the end of the armature shaft was pressed against the side of one of the car wheels; then end motion of the axle was apparently too much for it, for later devices by their engineer, Auvert, use a flat belt. In the Vicarino axle lighting system, now being exploited by the Pollak Battery Company of Frankfurt, Germany, the power transmitted by a friction drive, a flat-faced pulley on the armature being pressed against a larger flat-faced pulley on the car axle. This is similar to the drive used for some time in the Moskowitz system, and abandoned for a belt drive. The Dick system uses a dynamo made like a regular street car motor, hung upon the

*Abstract of a paper presented at the March meeting of the St. Louis Railway Club.

output from the dynamo is to let the speed vary with that of the car, and to change the strength of the magnetic field, or the effective number of armature wires to compensate any changes in speed. It is practicable to change the effective number of armature wires only within narrow limits, and, so far as the writer knows, this has been adopted only on the Brush dynamos used in the early work of Stroudley and Houghton in England. The regulation by changing the strength of the magnetic field has been used more generally. The method adopted by the Consolidated Railway, Electric Lighting & Equipment Company is to have a small motor connected with the adjustable arm of a resistance box and governed by a magnet in the main circuit; this motor automatically adjusts the resistance in series with the shunt field coil, so as to strengthen or weaken the magnetic field to compensate for any changes in speed above the critical speed of about 15 miles per hour. Personal observation of the working of this device on the Santa Fé road last December showed that, after the dynamo was connected with the lights, a sensitive Weston voltmeter indicated no perceptible variation of voltage between 15 miles and the highest speed attained, probably 40 miles per hour. In a few cars there was a slight but gradual change at the critical speed when the lights were shifted from the dynamo to the battery or vice versa. In no case was the fluctuation objectionable, and it was probably not noticed by the passengers.

One of the earliest forms of this regulator was used experimentally on a Boston & Albany car about 1897. In the Dick system the resistance is regulated by an electro-magnet. Another method of regulation is that formerly used by Moskowitz, and now used by Vicarino in Europe, namely, a differential winding on the dynamo field magnet. This carries two sets of coils, one a shunt field, such as used by the systems already noted, and in addition to this, a second coil of large wire through which the main current passes. As the car and dynamo run faster, the voltage tends to rise correspondingly, and, consequently, the current delivered to the lamps and batteries increases, but the current passing through the series coil weakens the magnetic field and so tends to offset the higher speed. There are numerous technical difficulties in the design of such a dynamo, but by careful adjustment the voltage at the lamps may be kept constantly within a narrow range. A test on the Vicarino system showed a variation from 31.0 to 31.8 volts as the train speed rose from 50 to 100 kilometers (31 to 62 miles) per hour, certainly a close regulation.

A source of difficulty in any system using a storage battery is that the voltage gradually drops off as the battery discharges. In large central stations this is compensated for by an end cell switch, which cuts in more cells as the voltage falls off. This is too much complication for train service. It is found, however, that if the number of lamps burning is diminished as the battery discharges, the voltage remains practically constant and the regulation is close enough. It naturally takes more voltage to charge a battery than it delivers, and when the battery is charged and discharged intermittently, being connected with the lamps at the same time, it is necessary to protect the lamps by a resistance which cuts down their voltage to the proper amount. This method is adopted in all axle-lighting sys-

tems. The adjustment of the series resistance involves some technical difficulties which need not be dwelt upon, but which yield to care in adjusting the equipment to the regular run of the car.

The devices for maintaining the proper polarity of the dynamo and for cutting it in or out as the critical speed is passed, are partly mechanical and partly electrical, the details of which would extend this paper, already too long, far beyond the limits of your patience. Whatever may be said of some of the older systems which appeared from time to time, there are at present at least four systems in Europe and two in America which seem to have reached the practical and reliable stage, and it is now possible to obtain axle lighting equipments even on rental basis at no greater cost than gas, with strong guarantees of perfect service backed by ample capital.

Death of Prof. Henry A. Rowland.

Henry A. Rowland, professor of physics in Johns Hopkins University at Baltimore, Md., died April 16. He was the son of the Rev. H. A. Rowland, and was born in Honesdale, Pa., in 1848, and was graduated as a civil engineer at the Rensselaer Polytechnic Institute in 1870. His earliest professional work was on a railroad survey.

In 1881 he was a member of the Electrical Congress in Paris, and was one of the jurors in the electrical exhibition in that city, being appointed a member of the Legion of Honor in recognition of his services. For many years Prof. Rowland had enjoyed an international reputation. He was a permanent member of the International Commission for establishing electrical units, was a corresponding member of the British Association and of the London Physical Society, and was intimately connected with scientific associations all over the world.

His original investigations were on a most comprehensive scale, and resulted in a vast number of electrical and optical discoveries and improvements.

New York Electrical Society.

The 214th meeting of the Society will be held at Havemeyer Hall, Columbia University, Thursday, April 25, at 8 p.m. Mr. C. F. Scott, chief electrician of the Westinghouse Electric & Manufacturing Company, will lecture on "Alternating Current Motors." The subject will be treated with special reference to the operation of motors rather than their theory and design. The characteristics of different types of alternating motors will be explained, and particular attention will be directed to the induction motor. The leading points of different forms of induction motors will be brought out, and the adaptation of these forms to different classes of service will be set forth. The motors will be on exhibition; performance curves will be shown, and lantern slides will illustrate various induction motors, together with their controlling devices. Other illustrations will show the motors in varied application. Experiments will also be given to illustrate the rotating magnetic field, which is the principle on which the motors depend for their operation. This lecture will embody a fund of valuable information never before made available to the public.

Exports of Electrical Material from New York.

The following are the exports of electrical material, from the port of New York, for the week ended April 10:

Antwerp, 15 packages, \$546; Argentine Republic, 133 cases, \$6,569; 3 cases motor vehicles, \$1,850; 18 packages, \$4,121; Brazil, 232 packages, \$44,203; 1 coil cable, \$105; Bremen, 1 package, \$75; British East Indies, 3 cases, \$158; British Possessions in Africa, 39 packages, \$2,180; British West Indies, 13 packages, \$454; Bristol, 6 packages, \$2,030; Bolivia, 9 packages, \$160; Canada, 20 cases, \$180; Central America, 68 packages, \$2,409; 1 case, \$270; Chili, 1 case, \$12; Cuba, 413 packages, \$2,299; 1 reel cable, \$137; Dundee, 5 packages, \$520; Ecuador, 82 packages, \$1,476; Glasgow, 1 case, \$100; Hamburg, 28 packages, \$2,142; 8 packages motor vehicles and parts, \$5,000; Havre, 7 packages, \$100; 1 case motor vehicles, \$600; Hayti, 9 packages, \$149; Huddersfield, 2 cases, \$32; Liverpool, 200 packages, \$22,229; 5 packages motor trucks, \$325; London, 197 packages, \$3,392; 5 cases motor vehicles and parts, \$3,820; Marseilles, 8 cases, \$587; Mexico, 71 packages, \$1,312; Newcastle, 27 packages, \$3,515; New Zealand, 2 packages, \$16; Peru, 16 cases, \$825; Preston, 3 cases, \$157; Ramsgate, 2 cases, \$200; Rotterdam, 1 crate motor vehicles, \$150; Siam, 34 packages, \$11,212; Southampton, 10 packages, \$2,409; 6 cases motor vehicles, \$3,000; U. S. Colombia, 7 packages, \$453; Venezuela, 140 packages, \$1,046; Vienna, 16 packages, \$792.

The following are the exports of electrical material, from the port of New York, for the week ended April 17:

Alicante, 8 cases, \$274; Antwerp, 16 cases, \$1,401; Argentine Republic, 72 cases \$2,125; Australia, 658 packages, \$47,603; 6 packages motor vehicles, \$5,050; British East Indies, 32 cases, \$1,051; 42 packages, \$10,525; British West Indies, 26 cases, \$662; 1 case motors, \$17; Central America, 236 packages, \$4,982; Chili, 1 package, \$11; China, 74 packages, \$2,451; Cuba, 263 cases, \$3,233; 4 barrels, \$195; Dunkirk, 8 cases, \$1,077; Ecuador, 1 package, \$57; Genoa, 137 cases, \$9,776; Glasgow, 109 packages, \$18,463; 81 reels cable, \$24,311; Hamburg, 32 packages, \$6,433; Havre, 71 packages, \$3,029; Japan, 73 cases, \$3,497; 781 packages, \$22,156; Liverpool, 135 packages, \$18,899; London, 291 packages, \$9,597; Marseilles, 9 cases, \$363; Mexico, 67 cases, \$2,170; 46 packages, \$10,063; Milan, 8 packages, \$992; Newcastle, 80 cases, \$9,700; New Foundland, 1 package, \$35; Nova Scotia, 5 packages, \$137; Nice, 1 case, \$50; Odessa, 4 cases, \$40; Peru, 5 packages, \$124; Philippines, 45 packages, \$4,396; Southampton, 19 cases, \$1,749; Uruguay, 8 cases, \$180; U. S. Colombia, 105 packages, \$1,406; Vienna, 56 packages, \$2,058.

Lundell Power Apparatus Selected.

The new large machine shops being erected at Elizabethport, N. J., for the Central Railroad of New Jersey, for which Mr. George Hill is consulting engineer, will be equipped exclusively with the well known Lundell power apparatus manufactured by the Sprague Electric Company. The equipment will consist of three 100 kw. generators of 240 volts and 250 r.p.m., direct connected to Ball & Wood engines, and 75 motors of various sizes for driving the machine tools. The Lundell generators and motors have long had the distinction of being of the very highest degree of ex-

cellen in the qualities pertaining to efficiency, durability and mechanical construction. All of the motors and one generator are booked for delivery in June and the other two generators will be delivered in July.

Extending Its Business.

The Thresher Electric Company of Dayton, O., has been incorporated under the laws of the State of West Virginia, with an authorized capital of \$600,000, for the manufacture and sale of all kinds of electrical machinery and appliances.

This corporation succeeds the company of the same name of which Mr. Alfred A. Thresher has been the sole proprietor and which he has incorporated for the purpose of providing more ample facilities for conducting the large and growing business which has been built up during the past eight years under his individual management.

Mr. Thresher is a member of the American Institute of Electrical Engineers, of the Franklin Institute of Philadelphia, an associate member of the Society of Naval Architects and Marine Engineers and a graduate of Denison University, where he obtained a thorough grounding in the principles of higher mathematics which are essential to a complete mastery of his chosen calling of an electrical engineer. After graduation he spent more than a year abroad in travel and observation and soon after his return established the business which he has prosecuted to the present time overcoming all the obstacles incident to a new enterprise with persistent energy and determination and with single ability.

In thus adding a leading branch of one of the most prominent of modern industries to the list of Dayton's successful manufacturing enterprises, it has been the aim of Mr. Thresher in addition to obtaining the discipline and knowledge of details, requisite to the conduct of any successful business, to also gain such a grasp of practical mechanical knowledge as well as a personal acquaintance with the requirements of purchasers as would fit him to design and construct the highest grade of electrical machinery.

In entering upon the general market, the Thresher Electric Company offers a complete line of direct current apparatus for electric railways, lighting and power transmission, and has placed its outfit at the head of the list as against all competition on three special lines. First, generators, both direct connected and belted, of the most approved design, exact in regulation under all degrees of load and economical in operation; second, a complete system of motors for the transmission and application of electrical power to the varied requirements of industrial uses, including an entirely inclosed type giving very high efficiency combined with complete protection; third, marine generating sets, of highest efficiency, designed to meet the severe requirements of the Government naval service.

Plans are being prepared for extensive shops with a complete equipment, affording the most approved facilities for manufacturing and testing.

Meeting of Municipal Electricians.

President Morris Mead of the International Association of Municipal Electricians has called a meeting of the executive committee of that body, to be held at Niagara Falls, N. Y., April 27.

PERSONAL MENTION.

Mr. Frederick P. Fish was recently elected a director of the American Bell Telephone Company and of the American Telephone & Telegraph Company. He has accepted the position of president of these companies and will take office July 1.

Prof. A. B. Clemens has been appointed principal of the School of Mechanical Engineering of the International Correspondence Schools, Scranton, Pa.

Mr. S. R. Smith, formerly a resident of Watertown, N. Y., has accepted the position of general manager of the Cincinnati, Columbus & Southern Railway, an electric line 100 miles long, with Cincinnati and Columbus as the terminals.

Mr. Frank J. Bazak, formerly superintendent of maintenance of the Detroit Telephone Company, has been appointed superintendent and consulting engineer of the Seattle, Wash., Telephone Company.

INCORPORATIONS.

The Wayne County Electrical Company, Lyons, N. Y. Capital stock, \$100,000.

The Citizens' Electric Light & Power Company, Elyria, O. Capital stock, \$20,000.

The Strasburgh Electric Company, Strasburgh, O. Capital stock, \$10,000. Incorporators: T. Kemp, E. P. Hopitzky and E. R. Carver.

The Hixley Electrical Company, Columbus, O. Capital stock, \$1,000. Incorporators: M. A. Pixley, C. F. Pryor and H. W. Webb.

The Frenchtown Electric Construction & Maintenance Company, Frenchtown, N. J. to supply light, heat and power. Capital stock, \$50,000.

The Monarch Electric & Wire Company, Chicago, Ill. Capital stock, \$25,000. Incorporators: Samuel J. Howe, Ralph R. Keller and Mark C. Keller.

The Dayton & Richmond Traction Company, Indianapolis, Ind. Capital stock, \$10,000. Directors: A. C. McDonald, H. G. Cress, C. J. Hall, William Ammon and D. T. Baker.

The Joy Printing Telegraph Company, New York City. Capital stock, \$80,000. Directors: O. J. Smith, Dobbs Ferry; G. W. Cummings and J. H. Grant New York City.

The Los Angeles & Pasadena Electric Railway Company, Los Angeles, Cal. Capital stock, \$1,000,000. Incorporators: A. McNally, D. Dewey, J. W. Hughes, P. M. Green, F. C. Bolt and others.

The Universal Wireless Telegraph Company, Pierre, S. D. Capital stock, \$20,000,000. Incorporators: J. N. Huston, Thomas B. Bishop and L. C. Smith.

The Prismatic Electric Sign Company, Syracuse, N. Y. Capital stock, \$4,000. Directors: F. C. Sherman and Emma O. Sherman, Syracuse, and Harry Hill, Williamsport, Pa.

The Leok's Company, New York City—to carry on the business of the supplies of light, heat and power, with gas and electricity, and to act as carriers of passengers and goods by land and water. Capital stock, \$200,000. Incorporators: Alfred George Brown, Edward B. Hawkins and Edward T. Magoffin.

The East Jersey Light & Power Company, Jersey City, N. J.—to manufacture electricity for light, heat and power. Capital stock, \$250,000. Incorporators: A. M. Reid, B. F. Freeze and Frank Bill, of New York; George Holmes, of Jersey City.

The Arcadia Electric Light, Telephone & Ice Company, Arcadia, Fla. Capital stock, \$20,000. Officers: President, J. J. Heard; vice president, C. C. Chollar; secretary and treasurer, J. L. Jones.

The Beresford Milling & Electric Company, Beresford, S. D. Capital stock, \$20,000. Incorporators: L. N. Crill, William A. Frild and Louis Wagner.

The North Georgia Electric Company, Dahlonega, Ga. to conduct a general electrical business, construct waterworks, etc. Capital stock, \$50,000. Incorporators: A. J. Warner, W. A. Carlisle, of Marietta, O., and J. F. Moore.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED APRIL 16, 1901.

ELECTRIC RAILWAYS AND APPLIANCES.

672,276. Automatic Fender for Street Cars. Wilhelm Maek, Hanover, Germany. Filed July 21, 1900.

672,319. Insulator for Conduit Electric Railways. John M. Fadie, Alexander Stevens and Romeo P. Tomassek, New York City. Filed Aug. 2, 1900.

672,335. Trolley-Pole Attachment. Willard P. Smith, Brooklyn, N. Y. Filed Feb. 20, 1901.

672,387. Electrical Connector. Thomas J. McTighe, New York City. Filed Feb. 6, 1901.

ELECTRIC LIGHTS AND APPLIANCES.

672,019. Electric Incandescent Lamp. Alf Sinding-Larsen, Fredriksvaern, Norway. Filed Oct. 2, 1899.

672,032. Arc Lamp Carbon. Herbert A. Couchman, Burton-on-Trent, Eng. Filed March 7, 1900.

ELECTRICAL MACHINERY AND APPARATUS.

670,015. Automatic Switch for Groups of Transformers. Alfred Schlatter, Buda Pesth, Austria-Hungary. Filed Oct. 5, 1900.

672,017. Electric Igniter for Gas Engines. Luther J. Severson and Louis D. Cond, Constantine, Mich. Filed June 29, 1900.

672,020. Electric Generator. George A. Burwell, Plattsburg, N. Y. Filed Jan. 17, 1901.

672,048. Static Machine. Henry E. Waite, New York City. Filed March 8, 1901.

672,201. Carbon-Sorting Machine. Mahlon M. Zellers, Cleveland, O., assignor to the National Carbon Company, Trenton, N. J. Filed Sept. 5, 1899.

672,232. Construction of Armatures and Inductors for Dynamo-Electric Machines or Motors. Oskar Lasche, Berlin, Germany. Filed Feb. 4, 1901.

672,268. Electric Chain Link-Welding Machine. Eugene F. Giraud, Doulaingourt, France. Filed Feb. 12, 1900.

672,332. Sparking Igniter for Explosive-Engines. William Roche, Jersey City, N. J. Filed Nov. 20, 1900.

672,411. Electrical Igniter for Explosive Engines. Madison F. Bates, Lansing, Mich. Filed Dec. 1, 1899.

672,419. Means for Controlling Electric Motors. Frederic A. Johnson, Binghamton, N. Y., assignor to the Stow Manufacturing Company, same place. Filed Jan. 15, 1901.

TELEPHONES AND TELEPHONE APPARATUS.

672,035. Toll-Collecting Machine for Telephones. William A. Foss, Cleveland, O., assignor to the American Toll Telephone Company, same place. Filed Sept. 17, 1900.

672,064. Telephone Metering System. Newman H. Holland, Brookline, Mass., assignor to the Automatic Telephone Motor Company of New Jersey. Filed Nov. 27, 1899.

672,122. Appliance for Telephone Switchboards. William W. Dean, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Dec. 8, 1899.

672,327. Switch for Telephone Exchanges. Frank A. Lundquist, Chicago, Ill., assignor to M. E. Richardson, trustee, Sterling, Kan. Filed Jan. 22, 1900.

672,388. Holder for Telephone Receivers. Ceibert H. Newhall, Philadelphia, Pa. Filed Jan. 14, 1901.

672,406. Combined Desk-Telephone and Switch-Stand for Interconnecting Telephone Lines. Hermann Herbstritt, San Francisco, Cal., assignor to the Automatic Interconnecting Telephone Company, same place. Filed Feb. 12, 1900. Renewed Sept. 17, 1900.

MISCELLANEOUS.

672,030. Motor Vehicle. Daniel T. Clark, Cleveland, O. Filed Oct. 8, 1900.

672,047. Electrode. Henry E. Waite, New York City. Filed Feb. 16, 1901.

672,054. Electric Crucible Furnace. Guillaume de Chalmot, Holcomb's Rock, Va., assignor to the Wilson Aluminum Company, New York City. Filed Sept. 5, 1899.

672,067. Electric Furnace. Francis J. Patten, New York City. Filed June 16, 1900.

672,071. Fireproof Insulating-Duct. Horace N. Speer and Edward D. Speer, New York City, assignors to the Security Conduit Company, same place. Filed Sept. 8, 1900.

672,074. Apparatus for Electrical Laundrying. George D. Burton, Boston, Mass. Filed June 27, 1898.

672,168. Telegraph Sounder. William A. Hudson, Washington, D. C., assignor to James Edgar Smith, same place. Filed Dec. 29, 1900.

672,184. Photometer. Ernest W. Cushing, Boston, Mass., assignor to the Eastern Electric Company, same place. Filed July 13, 1900.

672,191. Voltaic Cell. Washington H. Lawrence, Cleveland, O., assignor to the National Carbon Company, same place. Filed Oct. 9, 1897.

672,219. Electric Battery. Arthur L. Stevens, New York City. Filed May 28, 1900.

672,236. Electrical Resistance With Small Heating Capacity. Karl Ochs, Berlin, Germany, assignor to the Allgemeine Elektrizitäts Gesellschaft, same place. Filed Sept. 16, 1899.

672,243. Electrical Card Punching Apparatus for the Production of Jacquard-Cards. Jan Szczepanik, Vienna, Austria-Hungary. Filed Feb. 16, 1899.

672,246. Electric Fire-Alarm System. Fulton Gardner, Chicago, Ill. Filed July 28, 1900.

672,263. Supporting Device for Electric Fans, etc. Louis N. D. Williams, Ashbourne, Pa., assignor of one-half to Robert W. Scott, Philadelphia, Pa. Filed July 26, 1899.

THE TELEPHONE WORLD.

Independent Telephone Association Convention.

Through the efforts of the Queen City Telephone Company, now seeking a franchise in Buffalo, N. Y., the convention of the Independent Telephone Association of the United States will be held in that city this summer.

The association is made up of about 1,000 telephone companies, and there will be about 1,000 delegates in attendance at the convention, which will be held during the second week in June.

The Kansas State board of telegraph and telephone assessors has fixed the price at which the property of the companies in that State will be assessed this year. The new schedule of valuation agreed upon is a reduction from the valuation of last year of about 8 per cent. Telegraph poles and wire are assessed at \$65 per mile for first wire and \$10 per mile for each additional wire. First class telephone toll lines are assessed at \$40 for poles and first line and \$6 for each additional wire. First class telephone exchanges will pay taxes on valuation of \$175 for each pole, \$5 for each mile of wire, and \$5 for each instrument. Second class telephone companies using copper wire will pay on valuation of \$24 per mile for poles and wires and \$6 on each additional wire. Instruments of second class exchanges are valued at \$5 each, which is a raise of \$2 over valuation of last year. Third class exchanges will pay on valuation of 75 cents for each pole and \$2 per mile for iron wire and \$6 for copper wire. Instruments are assessed at \$4 each, which is a raise of \$1 over last year.

The Glen Telephone Company is about ready to commence operations in the cities of Johnstown and Gloversville, N. Y., with over 1,000 subscribers. It has been decided to give local investors opportunity to subscribe for the stock of this corporation. The company is incorporated with a capital stock of \$100,000, divided into shares of \$100 each. Subscriptions are invited to the stock at par for a limited time only.

It is reported from a reliable source that an independent company will be organized to construct a new telephone system between towns and villages in the locality of Kingsport, Tenn., and extending south to Washington County. The parties named in connection with the project have resources to operate the exchange.

The stockholders of the Overton Telephone Company met at Livingston, Tenn., a short time ago, and a complete reorganization of the company was effected, the capital stock being increased from \$5,000 to \$25,000. The company expects to construct 300 miles of telephone line within the next twelve months. The new company will put an exchange in Cookeville at once.

A war has been raging in Browning, Mo., between the Browning telephone exchange and several of the long distance lines that come in from the country and attach to the switchboard. The difficulty arose over the exchange raising the assessments.

Maurice L. Strunberger, of Jackson, O., and other Ohio capitalists have formed a company of which he is president for the construction and operation of telephone lines. The first line will be put in operation between Jackson and Wellston, and extended to Chillicothe. Portsmouth and other points.

The New Valley Telephone Company has been granted a franchise by the South Waverly, N. Y., borough council. B. G. Hubbel, of Cleveland, president of the Century Construction Company, which will build the new line, has lately been in Waverly in the interest of the concern.

The Augusta Telephone Company has been constructing a long distance telephone line from Augusta to Leon by the way of Haverhill, Kan.

The New Citizens' Telephone Company, which is the rival to the Bell Company, has opened up its business in Terre Haute, Ind., with about 250 new telephones.

The Independent Telephone Company of Waco, Tex., will at once request a franchise to erect and operate a system in Cleburne in that State.

The Warwick Valley Electric Light & Power Company has about decided to establish a local telephone system in Warwick, N. Y.

The Diamond State Telephone Company of Dover, Del., has increased its capital stock from \$1,000 to \$250,000.

Efforts are being made to have one of the telephone systems extended to Naples, S. D.

An Alleged 'Phone Invention.

A Chicago man, it is claimed, has perfected a machine that will keep an accurate count of the calls, to the satisfaction of both the company and the subscriber. It is a small clock shaped metal box designed to stand on a desk telephone or to be attached to the framework of a box telephone, connection being made by short wires with the telephone wires.

The mode of operation is quite simple. When the subscriber calls central, he presses a button on top of the indicator, which adds one to a number seen through a glass in front, the operation being about the same as a street car register when the conductor pulls the cord. At the same time it sends a buzz over the wires to central, showing that the call has been registered.

When the company desires to take the record of the telephone the subscriber is called up and asked to press the indicator button. When this is done the record taker in the central office reduces the number shown by the indicator. The apparatus is designed to do away with and settle disputes between subscribers and telephone companies as to the number of messages sent.

Telephone men in Sioux City, Ia., have taken the preliminary steps for the organization of a club in the interests of their business. It will include in its membership the managers of the various departments, the linemen and other employees. "Its object," said Manager E. A. Clark, of the Iowa Telephone Company, "is largely for the instruction of its members in the telephone business. Regular meetings will be held, at which papers will be presented and general discussions held upon live, up-to-date subjects that are of interest to the work. The members feel that there is something to be gained by organization and study."

The following officers of the Independent Telephone Company of Binghamton, N. Y., were elected last week: President, George C. Bayless; secretary, James H. Roberts; treasurer, Thomas B. Crary. The directors decided to increase the capital stock from \$100,000 to \$150,000.

The Maryland & Delaware Telephone & Telegraph Company, which operates a telephone line on the Delaware peninsula, has been granted a permit by the Cecil County commissioners to build a telephone line in Cecil County connecting with various towns and villages. The new line will run in opposition to the Diamond State Company.

The People's Telephone Company has obtained a franchise to conduct business in Lynn, Mass., from the aldermen. For two years the company has fought to enter that city. The vote was unanimous. The company binds itself not to charge above \$18 for office and \$24 for house telephones.

The United Telegraph & Telephone Company, the incorporation which has absorbed the Schuylkill Telephone Company, now controls 25,000 phones, and will soon hold the key to communication all over middle and eastern Pennsylvania. The office of the company will be in the Fidelity Building, Philadelphia.

The telephone war in Barre, Vt., has been brought to a close by the New England Telephone & Telegraph Company signing an agreement not to raise its rates or abridge its privileges for five years.

The Southern Electric Company will shortly establish a telephone exchange in Paris, Ky., to compete with the Cumberland Company. R. E. Rice, lately with the Cumberland Company, will be manager.

The Zenith Telephone Company of Duluth, Minn., will increase its funds by an issue of \$100,000 in bonds, which will be used for extensions.

A new telephone circuit is being put in between Fulington and Milton, Vt., by the New England Telephone Company.

The La Crosse, Wis., Telephone Company is stringing an overhead cable to satisfy the needs of its patrons until the underground cable is laid.

A telephone line between Murdock and Carlson, Minn., is projected and will probably be built this spring.

The Star Telephone Company of Ashland, O., has increased its capital stock from 50,000 to \$100,000.

A telephone company has been organized for the purpose of extending a line from Rolling Stone to Minnieska, Minn.

News from Williamsport, Pa., states that General Superintendent Henry Lewis, of the North and West Branch Telephone Company, says the new telephone company has all ready secured 700 subscribers, and is putting in an average of 50 new telephones per week. Work on the out of town connections is progressing rapidly. The eastern connection will be made at Dewart, and a gang of linemen will put up poles as far as Montoursville. The western connection will be made at Jersey Shore.

The Camden Telephone Company of Elizabeth City, N. C., and the Portsmouth & Cornland Telephone Company of Virginia are at work completing a long distance telephone line between these two ports. The line is already completed from Elizabeth City to South Mills, on the Dismal Swamp Canal, and also from Norfolk to Wallaceton, Va. The work of erecting the poles and wires on the canal from Wallaceton to South Mills is now progressing rapidly and the line will be open for communication in about sixty days, giving long distance service with Norfolk, and all points north and west.

The Empire State Telephone Company has refused to let the Sodus, N. Y., Local Telephone Exchange Company place its switchboard in the office where it was last year. This means that the Sodus company will be put to considerable expense in locating another place for its switchboard, as all the wires and several poles will have to be removed. The feeling between the two companies is very bitter. The Sodus company has in the neighborhood of 30 members, and the Empire Company about half as many.

The annual meeting of the Addison County Telephone Company was held in its office at Middlebury, Vt., and the following officers were elected: President, Allen Calhoun, of Middlebury; vice president, J. S. Dodge, of Warren; secretary and treasurer, A. T. Calhoun, of Middlebury. It was voted to expend the earnings of the company in extending the lines north and to Brandon.

Articles of incorporation have been filed with the secretary of State for the Story City, Ia., Telephone Company with a capital of \$10,000. A. M. Henderson is president; J. E. Cowin, vice president; W. A. Devendorf, secretary and Joseph Marvick, treasurer.

Two copper wires are being strung by the New England Telephone & Telegraph Company between Montpelier, Vt., and Boston. The wires can be used for either telephone or telegraph instruments.

J. M. Smith, who has the contract to construct the telephone line from Liberty to Wallisville, Tex., will extend the line to Turtle Bayou, Aarhuac, Graydon and Double Bayou at an early date.

The New York & New Jersey Telephone Company is to open a new exchange at Far Rockaway, N. Y., on May 1. There are over 400 telephone subscribers at that place and Rockaway Beach.

The Home Telephone Company has secured a franchise to establish a telephone system in the village of Lewiston, N. Y.

An independent telephone exchange with much lower rates may be established in Brattleboro, Vt.

TELEPHONE INCORPORATIONS.

The Madison-Clarke Telephone Company, London, O., capital stock, \$50,000.

The Carmel Mutual Telephone Company, Carmel, Ind., capital stock, \$5,000.

The Markleville & Emporia Telephone Company of Henry and Madison Counties, Markleville, Ind., capital stock, \$2,000.

The Maxwell Telephone Company, Maxwell, Ia., capital stock, \$10,000. E. N. Addin is president and J. O. Tenet is vice president.

The Parkersburg Telephone Company, Parkersburg, Ia., capital stock, \$10,000. Incorporators: G. G. Bickely, C. F. Bennett, John Secherling, H. W. Wilhelms and Robert E. Camp.

The Elbow Lake Telephone Company, Elbow Lake, Minn., capital stock, \$10,000. Incorporators: Henry Sampson, E. J. Scofield, T. E. Dybdel, F. V. Barnes and W. E. Lanleene.

The Southern Telephone Company, Lake Creek, Tex., capital stock, \$4,000. Incorporators: E. M. Reed, S. P. Buckler and J. A. Akard.

The Williamsburg Telephone Company, Williamsburg, Ia., capital stock, \$10,000. Incorporators: A. C. Moore, T. T. Osborne, H. H. Hull, John P. Doherty, M. J. Kelly and G. H. Hughes.

GENERAL ELECTRICAL NEWS.

Lighting.

Alexandria, Va.—It is proposed to enlarge the city's electric light plant at a cost of \$20,000.

Black Creek, N. C.—The citizens of this place have decided to put in an electric light plant.

Charlotte, N. C.—The Alpha Mills will install an electric light plant.

Chatham, N. J.—The citizens will vote on May 14 on the question of issuing \$15,000 electric light bonds.

Church's Ferry, N. D.—S. Hahn of this city is figuring on putting in an electric light plant at Minnewaukon.

Clarinda, Ia.—A business men's association was organized here a short time ago whose object is to secure in some way, and soon, an electric light plant, an improved waterworks system, street paving, etc.

Collinsville, Conn.—E. A. Perkins, of the Perkins Electric Light Company, has been here looking over the ground preparatory to installing an electric light system.

Crestline, O.—The electric light plant here was sold at sheriff's sale recently. It was bought by the First National Bank of Crestline and John A. Roebing Sons Co. of Trenton, N. J. The price paid was \$16,067. The plant will continue in operation.

Dayton, Wash.—An ordinance will soon be introduced calling for a special election to vote on the question of bonding the city for \$30,000 for either purchasing the present electric light plant from A. Roth or building a new plant.

East Jordan, Mich.—The common council has granted a 10-year franchise for electric lighting in the village to W. A. Loveday.

Egg Harbor City, N. J.—The power house of the Egg Harbor City Electric Light plant was totally destroyed by fire April 19. The loss is about \$10,000.

Excelsior, Minn.—At a recent election it was voted to grant a franchise for 20 years for an electric light plant to Thiss & Strong of Minneapolis.

Fort Gaines, Ga.—The Fort Gaines Mill & Power Company is in the market for electrical machinery and supplies, including a 500 light plant and one or two new water wheels.

Fremont, Ind.—This town will build its own electric light plant.

Granite Falls, Minn.—This city has voted to issue \$6,000 in bonds for the purpose of improving the electric light plant.

Greenville, S. C.—The Monahan Cotton Mills will install an electric light plant.

Homer, Ill.—G. Bowen is preparing to erect an electric light power house at this place.

Hubbard, O.—The municipal electric light plant here was burned recently. The loss is estimated at \$7,500.

Independence, Kan.—Walter Sickles, secretary of the Commercial Club, says we need some manufacturing industries, notably a cotton mill, also a cannery and an electric light plant.

Jackson, Tenn.—An electric light plant will be built here at a cost of \$12,000.

Laurel, Md.—This city will need electric light machinery soon. Address Ed. Phelps, mayor.

Maysville, Mo.—Messrs. Thompson & Mays of Platte County are here making arrangements to build an electric light plant.

Moro, Ore.—The question of erecting an electric light plant is being agitated here.

Orlando, Fla.—The question of erecting an electric light plant is being agitated by citizens of this place.

Portsmouth, N. H.—The new management of the Portsmouth Gas, Electric Light & Power Company intends to expend about \$500,000 in perfecting the plant, and the work will commence about May 1.

Roanoke, Ala.—The city council is laying plans for an electric light plant.

Saugerties, N. Y.—This place is soon to be lighted by electricity.

Scottsburg, Ind.—The citizens of this place are agitating the question of erecting an electric light plant.

Seaford, Del.—It has been decided to bond this town to build an electric light plant.

Terre Haute, Ind.—The L. B. Root Company has under contemplation the operation of an independent electric light plant of sufficient capacity for lighting its own store and other buildings in the vicinity.

Tullahoma, Tenn.—The Tullahoma Electric Light Company's plant was lately sold to G. W. Stegall.

Two Rivers, Wis.—A franchise has been granted Chicago parties for the construction of an electric light and waterworks plant at this place.

Winchester, Tenn.—Winchester will issue \$30,000 in bonds for the erection of an electric light plant. Address D. Taylor, clerk.

Street Railways.

Augusta, Ga.—A commission has been issued to the North Augusta Electric & Improvement Company, which proposes to build up the Hamburg territory in Aiken County, S. C., just across the Savannah River from Augusta, Ga. The amount of capital stock is to be \$1,500,000. One of the improvements alleged to be projected is an electric car line from Augusta to Aiken, the winter resort of New York society people.

Birmingham, Ala.—A recent fire turned the car barn of the Birmingham Railway, Light & Power Company, together with 40 electric cars.

Colorado Springs, Col.—Colorado Springs, Denver and Pueblo will be joined by a trolley line to cost \$2,500,000. It will be built by Chicago, Detroit and Cleveland capitalists. C. W. Taylor, who represents the syndicate, has petitioned for right of way over country roads. The main power house will be built here.

Cornish, Me.—The Maine railroad commissioners have approved the articles of association of the Ossipee Valley Railroad, which has petitioned for permission to build a trolley line from Cornish to Freedom, N. H., a distance of 20 miles. Boston and northern York County capitalists are interested in the project.

Covington, Ind.—The Crawfordville Traction Company is asking for a franchise to build an electric line over two roads in Fountain County.

Doylestown, Pa.—The Doylestown & Easton Trolley Company has selected Kulp's property at Plumsteadville as a site for the erection of the new power house building.

Ensley, Ala.—Dr. J. B. Stagg and associates of Pratt City presented a petition to the city council of Ensley asking for a franchise with the privilege to operate an electric railway in this city and between here and Brookside. The proposed line is about 10 miles long, and will touch at Pratt City and Wyiam.

Fairview, O.—The commissioners of Guernsey County have granted a franchise for an electric railroad along the National road from Wheeling, W. Va., to Cambridge, O. The franchise is in the hands of J. W. Rose, of this city, and the capital is being solicited.

Ft. Madison, Ia.—Plans are being prepared for an interurban trolley line to run between this city and Nauvoo. F. C. Wood of Chicago is the promoter.

Lyons, N. Y.—The Newark Electric Railway Company was lately incorporated with a capital of \$50,000 to operate a road five miles long, connecting the Central Hudson, West Shore & Northern Central Railroads with this village and with the proposed electric line to connect Syracuse and Rochester.

Pen Mar, Pa.—It is said that the Blue Ridge Electric Railway Company, organized to build a trolley line from Waynesboro to Pen Mar resorts, expects also to build a line to Leistersburg, in which case the Hagerstown system, if extended to Leistersburg, could connect with the Waynesboro-Pen Mar line.

Sausalito, Cal.—A movement is on foot to organize a company for the construction of a trolley road from here to Fairfax, by way of San Rafael. The movement is headed by James McCue of Corte Madera.

Seguin, Tex.—The movement is well under way to connect this place and New Braunfels by an electric railway.

Shamokin, Pa.—At a recent meeting of the directors of the Shamokin-Mt. Carmel Electric Railway Com-

pany it was unanimously decided to increase the capital stock from \$500,000 to \$750,000.

Watertown, N. Y.—A company is being organized to construct a trolley line from here to Carthage, a distance of 18 miles. The road will probably be built this summer.

Manufacturing.

Boston, Mass.—The main building of the blower works of the B. F. Sturtevant Company, in the Jamaica Plain district, was burned lately, causing a loss of \$350,000; fully insured. The concern manufactured various kinds of machinery and electrical goods as well as blowers.

Chicago.—The Benjamin Electric Manufacturing Company has been organized with a capital of \$2,400. W. Clyde Jones, Keene H. Addington, and Curtis B. Camp are those interested.—The Monarch Electric & Wire Company, capitalized at \$25,000, has recently been formed for the purpose of manufacturing electric goods and supplies. Samuel J. Howe, Ralph R. Keller and Mark C. Keller are behind the enterprise.

Elkhart, Ind.—On account of increased business the Kuhlman Electric Company, manufacturers of transformers, etc., has moved into larger quarters.

Jersey City, N. J.—The International Electric Enameling Company was incorporated last week, with a capital of \$125,000, to manufacture enamel ware. J. J. Nevin, J. J. McDavitt and H. E. Knox are behind the concern.

Muskegon, Mich.—The Shaw Electric Crane Company will soon erect a large and complete factory office here.

Trenton, N. J.—Herman J. Dercune, Charles P. Sherman and George T. Eyanson, all of Philadelphia, Pa., are interested in the recently formed concern known as the Regenerative Electric Locomotive Company and capitalized at \$100,000, to manufacture electric batteries.

Power and Transmission.

Baraboo, Wis.—Papers have been filed transferring the Munger mill property and dam with franchises at Kilbourn to William Guenther and A. D. Johnson of Appleton for \$40,000. It is understood that a company is to be formed for transmission of electric power to Portage, Baraboo and Madison.

Tacoma, Wash.—The White River Power Company has filed with the county auditor notice of its intention to appropriate 2,000 cubic feet of water per second from the White River at a point about 15 miles from here. It is proposed to divert water from the river in the foothills of the Cascade Mountains and carry it by a ditch to a point in the Stuck River Valley, where it will fall over a high bluff, thus creating a large water power for the generation of electricity. The electric power will be conveyed to this city and Seattle for distribution and sale.

Automobiles.

Geneva, O.—At a recent meeting of the board of directors of the Geneva Automobile & Manufacturing Company, the executive committee was authorized to have plans and specifications prepared for an addition to the present plant of a three-story brick building.

Huntington, N. Y.—The people here have a chance to start an automobile stage route. Mr. Lancaster, representing a firm which manufactures automobiles, is interested in the project. It is claimed that a practical demonstration of the work of the machine over the proposed route would undoubtedly lead to offers of plenty of money to establish the route at once.

Toledo, O.—Negotiations have been in progress for the consolidation of the two Toledo automobile companies, but at a recent meeting complications arose and the deal was declared off. Both companies will continue to conduct their business as heretofore.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

*Unlisted. †Ex div.
a The United Railways & Electric Company comprises in its organization the Baltimore Consolidated Railway Company, the Baltimore City Passenger Railway Company, all the lines of street railway operated by these companies, and also the Central Railway Co. of Baltimore. The pref. stock of U. R. & E. Co. has been issued in the form of income bonds.
b Leased to Boston Elevated Railroad Company.
c Owned by Brooklyn Rapid Transit Company.
d Leased to Brooklyn Heights Railroad Co., which guarantees 10% on capital stock.
e Stocks owned by Brooklyn Rapid Transit Company; road operated by Brooklyn Rts. Co.
f Stock owned by Kings County Traction Company; road leased to Nassau Electric R.R.
g Owned by Atlantic Ave. R.R. and leased to Nassau system.
h \$30 per share on outstanding capital paid as rental by lessee—West Chicago St. R.R. Co.; \$200,000 of stock owned by North Chicago Street Railroad Company.
i Controls by lease Chicago West Division Railway, Chicago Passenger Railway, and West Chicago Street Railroad Tunnel Company.
j 35 % per annum paid on outstanding capital as rental by lessee—North Chicago Street Railroad Company; \$625,100 of stock owned by West Chicago Street Railroad Company.
k Majority of stock owned by Chicago West Division Railway Company; 5 % on \$1,000,000 stock guaranteed by West Chicago Street Railway Company, lessee.
l Cincinnati St. Railway purchased the Mt. A. & Eden Park road, assuming its bonds.

*Unlisted. †Full paid. ‡Outstanding. §Ex-div.
a Leased to New Orleans Traction Company at 6 % on stock.
b Leased to New Orleans Traction Company at 8 % on stock.
c Leased to Central Crosstown Railroad at 8 % on stock and interest on bonds.
d Operating the former Met. Trac. system, that corporation having become extinct.
e Leased to 23d Street Ry. for 99 years; lease assigned to Metropolitan Street Ry.
f Leased to Houston, West Street & Pavyon Ferry—now Metropolitan Street Railway.
g Leased to Metropolitan Street Ry. at 8 % on stock until Oct. 1, 1897; thereafter 9 %.
h Leased to Metropolitan Street Ry. for 99 years from Jan. 1, 1895, at \$215,000 per annum.
i Leased to Metropolitan Street Railway for 18 % on stock.
j Leased to Met. St. Ry. for 99 years from April 1, 1892; 6 % first 5 years, 8 % thereafter.
k Leased to Metropolitan Street Railway for \$145,000 per annum.
l Leased to Metropolitan Street Railway for 18 % on capital stock.
m Controlled by Third Avenue Railroad by purchase.
n Dividends of 1 1/2 % yearly guaranteed by Consolidated Traction Company.
o Controls by lease the Allegheny, Cent., Citizens' Duquesne, Fort Pitt & Pitt's Traction.
p Leased to Consolidated Traction Company for 8 % per annum on par value of stock.
q Leased to Fort Pitt Traction Company for 6 % on \$8,000,000 capital stock.
r Leased to Consolidated Traction Company for 4 % on capital stock.
s Leased to Consolidated Traction Company for 7 % on capital stock.

ONTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16½@16¾c.; Lake, 17@17½c.; casting, 16½@16¾c.

Directors of the Bell Telephone Company have declared the regular quarterly dividend of 2 per cent.

The Chicago Edison Company has declared the regular quarterly dividend of 2 per cent., payable May 1. Books closed April 23.

The Union Elektricitäts-Gesellschaft of Berlin, owner of the Thomson-Houston patents for Germany, has declared a dividend of 10 per cent.

The Hudson River Telephone Company has declared a quarterly dividend of 1½ per cent., payable May 1. Books closed April 20 and reopen May 2.

A United Power and Transportation director says that any idea that the company will call the \$5 balance on the stock in the near future is incorrect.

The National Carbon Company has declared the regular quarterly dividend of 1½ per cent on its preferred stock, payable May 15. Books close May 4 and reopen May 16.

The Union Traction Company of Philadelphia has taken over the Frankford and Fairmount Park line, originally incorporated by William Wharton, and already partly constructed by the Union Traction Company.

The Copper Cobre Company was incorporated in New Jersey on Monday with a capital of \$1,000,000. The incorporators were John L. Elliot, Oscar Bergstrom, and Benjamin Prince.

Advices from Boston state that the United Electric Securities Company has declared the regular semi-annual dividend of \$3.50 on the preferred stock, payable May 1 to stock of record April 22.

W. J. Latta has resigned from the board of the Electric Company of America. Clement A. Griscom, president of the International Navigation Company, has been chosen to fill the vacancy.

The election of John I. Sabin, of San Francisco, president of the Central Union and Chicago Telephone Companies, places under his control the states of Iowa, Illinois, Indiana and Ohio, excepting Cleveland and Cincinnati.

It seems to be believed, says the Philadelphia "Stockholder," that the General Electric melon will not be cut for some time. One of the explanations offered is that the management does not wish to invite foreign competition.

The Staten Island Electric Railroad Company reports for the quarter ended March 31: Gross earnings, \$36,535; operating expenses, \$35,761; net earnings, \$834; other income, \$254; total income, \$1,088; fixed charges, \$25,000; deficit, \$25,912.

Plans are nearing completion for the Susquehanna River Electric Light & Power Company, which will furnish power from the river at Conowingo, Md., to Baltimore, Philadelphia and Wilmington. The company is expected to issue \$12,000,000 bonds.

Stockholders of the General Electric Company are in receipt of a circular, signed by M. F. Westover, secretary, relative to the exchange of General Electric preferred stock share for share for common stock. Such exchanges can be made between May 15 and August 1.

A party of English capitalists made a tour of inspection over the Brooklyn Rapid Transit system recently, accompanied by some of the directors of that company. They not only inspected the road itself, but the power houses and shops. It is understood that their purpose in making this examination was to satisfy themselves of the desirability of the property for investment purposes.

The following are quotations for some of the industrial stocks not quoted elsewhere: Electrical Load Reduction, 4½@4¾; Electric Boat, 18@20; Electric Vehicle, 12@14; Tel. & Tel. Company of America (full paid) 6@7; Electric Company of America, 9½@9¾; National Carbon, 16@16¾.

The movement of Amalgamated Copper on the Stock Exchange Monday was very erratic. Closing on Saturday at 126 the stock opened down over 4 points, then went up 3½, then went down 6 points, only later again to go up nearly 4 points, closing with a net loss of 3¼ points on dealings in 88,000 shares.

It is rumored that the Brooklyn Rapid Transit now has in its treasury about \$5,000,000 cash, the result of sales of treasury securities. The company's treasury is now abnormally supplied with money for all needs, and some think this may influence the payment of a small dividend this summer. This, however, is not the general view of inside interests.

There is surprise in Wall Street over the movement in the tractions, particularly in Brooklyn Rapid Transit, which is said to be due "to important developments" in the various properties. Some announcement of the kind, whether true or false, is certainly due, and one street theory now takes the form that Metropolitan has been held in repression throughout the general upward movement for a purpose known only to insiders.

Thompson, Tenney & Crawford, bankers, own and offer for sale, recommending the bonds as a choice investment security, \$750,000 first refunding mortgage 5 per cent. sinking fund gold bonds issued by the Erie Electric Motor Company, owning and operating all of the street railway companies in the city of Erie, Pa. The announcement includes the statement of the gross earnings of the railroad, showing for the year 1900 over \$180,307, while those for 1901 are estimated to be \$200,000. The net income for the same period was for 1900 \$72,660, and is estimated for the present year at \$85,000. A sinking fund provides for the redemption of these bonds by an annual payment of 1 per cent. from April 1, 1906, to 1915, inclusive, and 1½ per cent. from April 1, 1916 to 1941.

EDITORIAL NOTES.

The Ninth Annual Report of the General Electric Company.

As has always been our custom we publish in full elsewhere in this issue the Ninth Annual Report of the General Electric Company. The report shows gross receipts for the year ended January 31, 1901, of \$29,829,652.23, as compared with \$23,248,170.45 for the year ended January 31, 1900. The undivided earnings during the year amounted to \$4,276,150.12, which added to the surplus at the commencement of the year give \$6,629,180.64, as the total surplus on January 31, 1901. The sum of \$1,728,249 was paid in dividends on the preferred and common stock, while \$240,040.33 is given as the interest on debentures.

The patent account is carried at \$2,000,000, the same as in the previous report, in spite of the fact that there was expended during the past fiscal year \$360,258.99 in patents and patent litigation, and \$604,672.27 in obtaining the patents and good will of the Siemens & Halske Electric Company of America and the Marks Enclosed Arc Lamp Company.

The report shows the capital liabilities of the General Electric Company to be—common stock, \$21,400,300; preferred stock, \$2,551,200, and debentures \$1,534,000. There is a movement on foot to retire the preferred stock, and it is reported that this retirement is preliminary to an increase in the common stock to about \$35,000,000.

An English Engineer's Objections to Subways for Electric Wires.

In a number of English cities suggestions have recently been made for the construction of underground subways to carry electric, telephone and telegraph wires, gas, water and other pipes, etc., so as to avoid the continual opening up of public roads, which has lately given rise to such great inconvenience not only in London but in most of the large cities of this country as well. In the course of a discussion at the Glasgow, Scotland, section of the Institution of Electrical Engineers, Mr. Chamen mentioned a few objections to the idea, which to his mind stamp it as impracticable from an engineering point of view. Mr. Chamen is the city electrical engineer of Glasgow, and he says that the engineers of gas

and water departments are not at all enthusiastic about such proposals. The gas engineer objects that the tunnel or subway might become accidentally filled with a highly dangerous explosive mixture of gas and air; the water engineer points out that in the case of a large water main bursting—an accident which will happen occasionally in spite of all precautions—matters would be in a serious state inside the tunnel. Mr. Chamen also asked how access was to be provided for such cumbersome articles as 9 ft. or 12 ft. lengths of cast-iron pipes 4 feet in diameter, and whether the tunnel was to be sufficiently large to accommodate a railway for the purpose of conveying through it such goods as would be needed for repairs.

* * *

Electricity as a Motive Power on Trunk Line Railroads.

In our last issue we commented on an article from the pen of Mr. Albert L. Johnson, which has brought forth an interesting communication from Mr. Charles J. Kintner, the well-known patent expert of this city, which we deem sufficiently important to give in these columns. Mr. Kintner writes as follows:
Editor *ELECTRICITY*.

SIR: Referring to your editorial, on page 246 of the issue of April 24th, entitled "Electricity and Railroads," I beg to differ with you as to the future use of electricity in connection with through or trunk lines between cities. I think Mr. Albert L. Johnson is correct in his view of the fact that the scheme which he proposes will so vastly increase the traffic as to guarantee a fair interest upon the investment, based upon the present conditions of imperfect service. In fact, I am confident that this is true in the knowledge of what has been done on parallel lines, steam and electric, in Michigan, between the cities of Detroit and Ann Arbor, where the through fare on the steam road, namely, the Michigan Central, is \$1.10 and on the electric road 50 cent-fares to intermediate places being correspondingly proportioned. Electric trolley cars have been running between these two cities for a number of years and have paid, I am advised, good dividends upon the investment. In fact the success of this road has been such that a second electric line has been chartered between the cities of Jackson and Detroit, running through Ann Arbor, parallel

with both of the before-mentioned lines, and is now being built.

A strange feature of the conditions may be noted also, in that through traffic between Detroit and Ann Arbor, on the Michigan Central road has not been materially diminished. This can all be accounted for probably upon the theory that the railway trains only stop at stations about 10 miles apart and run with less regularity, while the trolley cars take and drop passengers at all points and run half hourly all day long, thus verifying Mr. Johnson's views.

There are other matters to be considered also, which I think it is entirely probable you have not thought of; to wit, the fact that it is possible to increase the speed to such an extent as to make it desirable for passengers to travel by such means, even should it be found necessary to increase the fare. It is also possible and entirely practicable to construct a trunk or through electric road which is absolutely safe from front and rear end collisions and at crossings and sidings, and without the intervention of human controlled block systems such as are now deemed the best methods of protecting high speed steam trains from collisions. This, you will readily understand, because it is possible to so control the application of electrical energy to the cars as to prevent any car from colliding with another, either in the front or rear, and also to prevent accidents at draw-bridges, a condition of affairs not possible with existing steam lines, for the reason that the power with steam lines is always under the control of the engineer only of each train; whereas, the power with electric lines may be absolutely cut off when a car approaches too closely to another car preceding it on a sectional third rail in advance.

The N. Y., N. H. & H. Railroad, is working successfully, on a number of its branches, electric third rail traction systems, and contemplates, I am advised, in the not distant future, the manipulation of its entire road by electricity.

The problem, it seems to me, is very closely kindred to that which presented itself when the elevated roads were first introduced in New York City. At that time it was said that the elevated roads would undoubtedly "kill" the surface roads, whereas, as a matter of fact, it was found that the elevated roads not only accumulated sufficient business to pay dividends, but also, strangely, the parallel surface roads were found to be doing an increased business, this being due to the fact that while the elevated roads carried passengers through to the upper parts of the city, the surface roads were doing an increased business on what may be termed a "short haul" or local passenger traffic.

This condition is the same found on the Michigan roads above referred to. I am of the opinion that Mr. Johnson has not misstated the case of the future of electrical railways, and while they may not "doom" the steam systems, they will certainly be as prosperous and as useful as he predicts.

Yours truly,

CHARLES J. KINTNER.

45 Broadway, New York, April 24, 1901.

Mr. Kintner's comments are to the point, but if we mistake not, we are looking at the subject from two different standpoints. We had no intention of asserting that an electric road paralleling a steam road would not pay, but what we do claim is that the time is not

yet ripe, and will not be for many years to come, for the substitution of electricity for steam on trunk line railroads. As an example, it can be shown in figures that the Pennsylvania Railroad would gain nothing and would simply be expending immense sums of money uselessly were it to undertake to convert its lines from New York to Chicago and still further West into electrically-operated lines. We presume that Mr. Johnson refers to such a radical change when he states that "we must start afresh from the ground up, discarding the cumbersome and expensive mode of operation now in use on the steam railroads."

Both the electric third-rail system and the electric locomotive undoubtedly have their usefulness, but as Mr. Yerkes said, when referring to this subject some time ago, "for long-distance strides over continents, the electric locomotive is as yet only a dream."

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

MR. J. A. LEONARD, of Mechanicsville, N. Y., who was formerly the engineer in charge of the construction of the Hudson River Power Transmission Company's dam, has sailed for Porto Rico where he will be engaged in building a railroad and power plant.

PROF. GUGLIELMO MARCONI, inventor of wireless telegraphy, is engaged to be married to an American girl. His fiancée is Miss Josephine B. Holman. Her father was the late Justice J. Holman of the Supreme Court of Indiana. Prof. Marconi met his intended wife on board ship in his recent trip to this country. He sailed for Europe last week, but it is said that the ceremony will be performed in this city in the fall.

The Glasgow International Exhibition will open on May 2. A dispatch states that the preparations are so far complete that the management last week invited a large party of home and foreign newspaper men to inspect the show, which is certainly the best of the secondary exhibitions that have been given in Europe in the past half century. The American exhibits are very creditable, but are limited and practically confined to machinery and tools.

A PARTY of Philadelphia capitalists will start a system in Mexico for the employment of peat in the generation of heat and power. William A. Stern of Philadelphia, who has been conducting for a year or more experiments looking to the utilization of this product, has demonstrated that peat is adaptable for the generation of power with a commercial efficiency of over 60 per cent., of that of the best bituminous coal. This means much to industrial enterprises, as in the City of Mexico coal costs an average price of \$20 per ton, while the quantity of peat declared to be equivalent in heating value to a ton of coal can be delivered for \$2.

FROM RETURNS received from the thirty-five electric railways of Canada, the Dominion statistician makes up the following statement: At the end of December, 1900, the number of miles of electric railway, in Canada, increased to 681 miles, or 49 miles over the number in the year previous. These railways carried 118,-

129,862 passengers in 1900, an increase of 14,097,203. This is equal to carrying the total population of the country 21 times. The car mileage run was 30,924,355 miles, an increase of 1,277,508 miles over last year. The mileage run and the passengers carried show that for each mile run the electric carried 2.8 passengers against 3.5 in 1899. The amount of paid-up capital invested in electric on the 31st of December, 1900, was \$20,633,000, and the bonded debt was \$12,619,422. The number of cars in active service in 1900 was 1,642, an increase of 98 over the previous year. The employees numbered 4,493, showing an increase of 164 over 1899. The total receipts for the year were \$5,422,540, and the expenses were \$3,268,001. Since 1897, the number of passengers carried by the electric railways increased from 83,811,000 to 118,130,000, an increase of about 41 per cent.

THE American Mathematical and American Physical Societies opened their spring meeting at Columbia University Saturday. Scientists from various universities and cities attended. Among the papers read were "The Efficiency of the Acetylene Flame," by E. L. Nichols, and "The Specific Heat of Electrolytes in Solution," by William F. Magie, of Columbia University.

LONDON'S automobile show opens May 4.

A REPORT from Aspen, Col., states that in the Della S. mine has been made a great discovery in a new mineral. When this ore was first struck it was not considered of any value, but the continuance of the ore body excited some curiosity to know just what it was, and Manager Anderson had a test made with the result that it surprised him. It proved to be cadmium, a rare mineral used by Edison in his recently discovered storage batteries. With the discovery of cadmium, Edison declared electricity would become cheaper than water.

A DISPATCH from London says in consequence of the complaints of the transatlantic steamship companies the Board of Trade has ordered a wireless signaling station to be erected at Fastnet Rock. Vessels fitted with the necessary apparatus will thus be enabled to save the time now consumed in communicating with the station on the mainland.

AT Albany, April 25, the Governor signed the bill of Mr. Doughty, providing for registration of automobiles with the Secretary of State and allowing them to run on any highway in the State at a speed not to exceed fifteen miles an hour, outside of incorporated cities and villages.

ONE of the difficulties, in connection with the street car service in Havana, Cuba, says Mr. Wm. M. Doull, the secretary-treasurer of the Cuban Electric Railway, of which Mr. A. F. Gault, of Montreal, is president, is the fact that they have no five cent pieces to use. This has been overcome, but not satisfactorily. They have the paseta, which is equal to fifteen cents, and for this piece of money three tickets are secured. Mr. Doull was in Havana when the first section of the street railway was opened for traffic, and he states that the success, in the way of traffic, was even better than was ever anticipated. The first start made was on ten miles, and the company had not sufficient cars to accommodate the crowds

that wanted to avail themselves of the new system of travel through Havana's streets.

WHAT is believed to be the largest electrically operated drawbridge in the world is the new one over the Connecticut River at Middletown. It consists of two fixed spans, 200 feet from center to center; two fixed spans, 225 feet from center to center, and one draw span 450 feet from center to center of piers. Although the bridge is 30 miles from the sea there is a tide of two and a half feet, and the highest known water-mark is twenty-five feet above low water. The floor of the bridge is six feet above the last elevation, making the distance from the floor to low water thirty-one feet. As the bridge was designed to have one trolley-car track, and two lines for carriage travel, it was made 26 feet wide from center to center of the trusses, while provision was also made for connecting sidewalk brackets to the floor beams when they should be needed.

It is stated that Atlantic City, N. J., is experimenting with a motor power garbage cart.

FRENCH BISKRA, on the edge of the Sahara Desert, is lighted by electricity.

THE question whether there will be one or several power houses for the Rapid Transit subway, being built in this city, has been practically decided by the engineers of the construction company. There will be one main power house, larger than either the Manhattan or Metropolitan plants, with several sub-stations for the distribution of the electrical energy. Another department of the Rapid Transit Subway Construction Company has been established by the appointment of J. Van Vleck as mechanical engineer with authority to organize a force and coöperate with the electrical engineer, L. B. Stillwell, in the construction of the power plant. The site of the power house has not yet been determined. It is a question of real estate values principally.

A COMBINED motor-driven lawn mower and roller has been invented by an Overbrook, Pa., genius.

OWING to the recent storms, which have necessarily retarded work on the buildings of the Pan-American Exposition at Buffalo, it has been decided not to formally open the Exposition before May 20.

JAMES DOUGLASS REID known throughout the country as "the father of the telegraph," died Sunday at his home, 244 West Ninety-ninth street, this city. Mr. Reid was a pioneer in the use of the telegraph and a confidant of S. F. B. Morse. In 1845 Mr. Reid built the first telegraph line from Lancaster to Harrisburg. He was afterward superintendent of the Magnetic Telegraph Company's line from New York to Washington, of the Atlantic and Ohio line to Pittsburgh from Philadelphia, and of the New York, Albany and Buffalo lines. He founded the "National Telegraph Review" in the early fifties.

A LONG-DISTANCE run with a light electric motor car was carried out recently in France by M. Garcin between Paris and Mantes and back, when a distance of 85 miles on one charge of the battery was covered in 6 hours 32 min. 55 sec. The vehicle weighed complete 14 cwt. 3

lbs., and was fitted with a battery of accumulators of the Buquet-Garcin-Schiore type of 120 ampere hours' capacity and weighing only 64 cwt. The run, according to the London "Electrician," is claimed to be a record for a car of such light weight.

WITH a reorganized company, new engineers and new capital, the old Hudson River tunnel project has been revived, and there is a prospect of an early resumption of work after nine years of idleness. Changed conditions in the money market and the boom in bridges and tunnels at present existing have led the owners of the property to take steps for the completion of the tunnel, which now extends two-thirds of the distance from Jersey City to the foot of Morton street, in this city. The old tunnel has been pumped out and is said to be in as good condition as when work was stopped in April, 1892. Bids have been invited from contractors who have had experience in tunnel building, and it is asserted that the tunnel can be completed from shore to shore in one year's time. Those who are in a position to know the plans of the company deny that the tunnel has been obtained by A. L. Johnson to give his trolley line an entrance into New York, or that the Pennsylvania Railroad Company has an option on the passageway, as has been rumored.

A DISPATCH from San Francisco states that electric power generated on the Yuba River, 140 miles away, was used in the operation of street cars in Oakland on April 28. This is said to be the longest transmission of electric power in the world. The power is generated by turbine wheels. The cable, 140 miles in length, is six-tenths of an inch in diameter and is of copper, with aluminum alloy, which will prevent oxidization. It is this cable that is suspended across Carquinez Straits by a span of 4,400 feet and 300 feet in air. The test is considered one of the most successful in the history of electricity, a current of 40,000 volts having been transmitted the entire distance with a loss not exceeding 5 per cent.

A PRESS report states that Senator Clark of Montana, who is now in Europe, has obtained control of an electrolytic process for manufacturing copper sheets and tubes from the crude copper at a great saving in cost. The latter, it is claimed, will amount to as much as \$100 a ton on the finished material.

THE Rapid Transit subway of this city is one-tenth completed, and from now on work will be done at the rate of \$1,000,000 a month.

ACCORDING to "Lightning," London, Kugel of Berlin, Germany, has been granted a patent on a method of depositing nickel electrolytically in layers of any desired thickness. The product is said to be equivalent to rolled nickel as regards its mechanical properties, toughness, durability and capability of extension. The nickel solution is acidified by a mineral acid which is unalterable by the electric current. While such an addition usually spoils the nickel bath through causing the deposit to flake off, this is obviated by keeping the electrolyte at a temperature over 30° C., when a homogeneous non-crystalline metal is deposited of the above characters and of any required thickness.

General Electric's Ninth Annual Report.

RESULTS OF THE PAST YEAR'S BUSINESS.

Statements of the President, First, Second and Third Vice-Presidents.

The following is the full text of the General Electric Company's Ninth Annual Report—for the year ending January 31, 1901:

PRESIDENT'S REPORT.

SCHENECTADY, N. Y., April 20, 1901.

To the stockholders of the General Electric Company:

The profits of your company for the past year (including a profit of \$419,066.80, derived from the sale of securities), after deducting all general, patent and miscellaneous expenses, expenditures on factory plants and machinery and allowances for depreciation and losses were.....\$6,244,439.45
Dividends on preferred and common stock and interest on debentures.....1,968,289.33

Balance added to surplus account \$4,276,150.12

For details of the business in the departments of the First, Second and Third Vice-Presidents, attention is especially called to the subjoined reports of those officers.

Your attention is called to the certificate of public accountants hereto attached.

I regret to announce that Mr. J. P. Ord, who has for many years rendered services of the highest value to the company as its Second Vice-President, has tendered his resignation of the office to take effect upon the date of the next annual meeting.

Fortunately for your interests the company will still have the aid and counsel of Mr. Ord as a member of its Board of Directors.

Mr. Hinsdill Parsons, the able head of the law department at Schenectady, has recently been elected Fourth Vice-President of the company.

The admirable and effective work done in each of the various departments of the company is deserving of the highest commendation.

By order of the Board,

C. A. COFFIN, President.

FIRST VICE-PRESIDENT'S REPORT.

SCHENECTADY, N. Y., April 20, 1901.

C. A. Coffin, Esq., President General Electric Company.

SIR: I submit herewith a brief report of the sales department for the fiscal year ending January 31, 1901:

Total orders received.....\$27,969,541
For the four previous years the orders have been as follows:

Fiscal year ending	Orders received.
January 31, 1897.....	\$11,170,319
" " 1898.....	14,382,342
" " 1899.....	17,431,327
" " 1900.....	26,323,626

In reports of orders received, we exclude services of experts, freight and transportation charges, bare copper wire and engines and boilers and other apparatus and supplies not manufactured by the General Electric Company.

During the year over 150,000 separate supply

orders were received, averaging over \$60 each, and over 12,000,000 incandescent lamps were ordered.

Over 87 per cent. of the year's orders were on our standard terms, i.e. cash within sixty days.

We received orders for over 350,000 horse-power of alternating and direct current generators, and more than 600,000 horse-power of electric motors and transformers for various uses.

LOCAL OFFICE STOCKS.

Our local office inventories and their classification for the past five years are as follows:

Fiscal year ending.	Book value.	Classification.		
		Active.	Inactive.	Obsolete.
		Per cent.	Per cent.	Per cent.
Jan. 31, 1897.....	\$511,919	86.	12.	2.
" " 1898.....	437,400	90.	8.	2.
" " 1899.....	478,023	92.5	6.5	1.
" " 1900.....	658,064	96.6	2.8	0.6
" " 1901.....	702,044	98.	1.6	0.4

GENERAL REMARKS.

Long distance transmission plants have continued to increase in number and importance. One of the most interesting contracts of this character is one closed this year for the electrical equipment of a power station, the construction of a pole line nearly 100 miles long, and for supplying 4,000 hp. of our motors, to operate mining machinery at the Kolar Gold Fields in the State of Mysore, India. This contract was awarded to us after an exhaustive investigation, and a careful study on the part of the engineers of the Mysore Government, of the competitive tenders of the principal electrical firms of the world.

The consolidation of various small railway and lighting systems under one management has resulted in the concentration of electrical apparatus in large stations equipped with alternating apparatus and supplying energy over a considerable area; the system employed being that of the revolving field generator and rotary converter, mentioned in previous reports. The demonstrated economies of our early installations of this character have led to a great extension of this kind of business. Among the important contracts is one for 30,000 hp., in large generators for the initial equipment of the new power house of the Niagara Falls Power Company at Niagara Falls.

During the past year we have established an office in London for the better conduct of our European business, and such business from the British Colonies and other parts of the world as naturally focuses in London.

The selling organization has responded cheerfully to the extra demands upon it due to the growth of our business during the past two years, and I desire to express my appreciation of the faithful and efficient work of the individuals comprising this organization.

Respectfully submitted,

EUGENE GRIFFIN,
First Vice-President.

THIRD VICE-PRESIDENT'S REPORT.

SCHENECTADY, N. Y., April 20, 1901.

C. A. Coffin, Esq., President General Electric Company.

SIR: I submit herewith report on manufacturing and engineering for the fiscal year ending January 31, 1901:

MANUFACTURING.

Our large and increasing business has required the expenditure, for extensions to existing buildings and the erection of new ones,

and for additional machinery, of approximately \$1,200,000, exclusive of the cost of patterns, special tools, furniture, etc.

At the Schenectady Works, the extensions to Building 23 of about 40,000 sq. ft., to provide for the increased demand for switchboards, controllers and similar apparatus, and to the iron foundry, of about 40,000 sq. ft., both mentioned in my last report, were completed during the year.

A new porcelain shop of 46,000 sq. ft., and buildings for the manufacture of special insulating materials, aggregating 30,000 sq. ft., have also been completed.

To provide adequately for the increased power required for testing and manufacturing purposes, and for the necessary heating of the extensions to plant, our power house has been extended and additional boilers and engines aggregating 6,000 horse-power have been installed.

We are now erecting a pattern shop of 52,000 sq. ft., and adding about 70,000 sq. ft. to our machine shop facilities.

At the Lynn Works, extensions amounting to 70,000 sq. ft. have been made to various departments.

At the Harrison Works, a fireproof storage building of 68,000 sq. ft., is nearly completed.

The present floor area of all our factory buildings is approximately 2,300,000 sq. ft., which will be increased about 200,000 sq. ft., when the buildings now under way are completed.

The number of employees in all the works is over 12,000.

The method of estimating factory cost has been the same as that employed in previous years, but varying percentages have been used to provide for the difference in general manufacturing expenses on standard and special apparatus. The percentages used to cover expenses have been demonstrated by the annual inventory to be sufficient for the purpose.

ENGINEERING.

Engineering work during the past year has been directed towards increasing the efficiency and reducing the cost of our standard apparatus, and the designing of new machinery or modifications in standard machinery to meet special cases.

The demand for generators of large size, from 3,000 to 5,000 hp., has increased, and the average size of electric motors and generators has materially increased.

The 5,000 hp. generators for the new power house at Niagara Falls have been designed and their construction is well under way. This installation, which is expected to be a model of efficiency and simplicity, also includes a switchboard of special design for the control of 30,000 hp.

In many instances it is found to be cheaper to convert the energy of coal into electricity at the mines and transmit it over a wire to the point of consumption, than to transport the coal itself. Successful installations of this character have been made by us during the past year. It is expected that such installations will become more numerous and important, as the distance to which electricity may be economically transmitted is increased.

The number of industrial plants in which electric motors are used for the operation of machinery, such as plate glass, harvesting, cotton, woolen, cement machinery, etc., has largely increased. Some of the larger mills have installed electric motors to an aggregate

capacity of more than 5,000 hp. Users of electric motors are rapidly learning to appreciate the value of electricity, not alone on account of the saving in power following its use, but principally because of the convenience, flexibility, and ready control of the electric system which invariably economizes labor and increases production.

The original and important work done by several of our engineers in the development of a simple and highly effective train control for electric traction is a matter of great satisfaction.

Much of our best engineering skill has been devoted to the difficult problem of providing a simple and safe method of controlling and switching large amounts of electrical energy at high voltage. The result has been signally successful and has been followed by large orders for switchboard installations involving the use of our improved appliances, among which orders may be mentioned one of 50,000 hp. capacity and one of 30,000 hp. for two of the most important electrical enterprises in this country.

There has been a steady improvement in the quality and efficiency of numerous small articles of our manufacture, such as arc lamps, meters, instruments, etc.

We have as heretofore protected our new and important engineering designs as far as practical by applications for letters patent.

The arduous and effective work of our factory managers and engineers deserves our highest praise.

Respectfully submitted,

E. W. RICE, JR.,
Third Vice-President.

SECOND VICE-PRESIDENT'S REPORT.

SCHENECTADY, N. Y., April 20, 1901.

C. A. Coffin, Esq., President General Electric Company.

SIR: The balance sheet and statement of profit and loss, herewith transmitted—with explanation of every item on the balance sheet—include the assets and liabilities and profit and loss accounts of the Edison General Electric and Thomson-Houston Electric Companies (which, for convenience of bookkeeping, are consolidated with those of the General Electric Company) at January 31, 1901; and when "the company" is spoken of, both the above-mentioned corporations are included.

ASSETS.

PATENTS, FRANCHISES AND GOOD WILL.

These were carried in the last annual report at \$2,000,000.00. During the year there were expended for acquiring sundry new patents, in patent expenses and patent litigation..... \$360,258.99

In addition to the above, the patents and good will of various manufacturing companies, including the Siemens & Halske Electric Company of America and of the Marks Enclosed Arc Lamp Company were acquired at a cost of..... 604,673.27

..... 964,931.96

Total patent account before closing the books..... \$2,964,931.96

The bookkeeping profit of the difference between the par of \$3,763,000 debentures and \$3,124,300 (par) of common stock issued therefor, including \$20,642.77 cash to purchase the fractions connected with such issue was credited to patents and good will..... \$618,067.23

Balance now written off..... 346,874.03

..... 964,931.96

Leaving all the patents, franchises, good will, etc., of the company standing on its books at the date of this report, as per balance sheet, at \$2,000,000.00

FACTORY PLANTS.

This account represents the real estate (lands and buildings); machinery (steam and electric plants, tools, appliances, etc.); patterns (including drawings, etc.); and sundries (fittings and other small property accounts) of the

manufacturing plants at Schenectady, N. Y.; Lynn, Mass., and Harrison, N. J.

All are free from mortgage or other lien.

The lands of all three plants now amount to about 180 acres and the total factory floor space of all their buildings is approximately 2,300,000 square feet.

It is worthy of note that the total book value, \$1,858,044.65, of the lands and buildings of all three factory plants is about 80 cents per square foot of the manufacturing floor space in those buildings.

The company's constantly growing business necessitates continuous large expenditures on its plants, to increase their manufacturing capacity by acquiring more land, enlarging old and erecting new buildings, installing new machinery and for general improvements.

On January 31, 1893, the book value of all three factory plants was..... \$3,958,528.21

In the fiscal years 1893 to 1900, both inclusive (over and above all ordinary expenditures for the maintenance and repair of buildings and machinery), additions of lands, buildings, machinery, etc., have been made at a total cost of..... 6,127,770.92

Total book cost of the plants..... 10,086,299.13

To offset depreciation there have been written off during those eight years..... 6,686,297.13

Leaving their book value at January 31, 1901..... \$3,400,002.00

Divided as follows:

Schenectady plant.....	\$2,300,000.00
Lynn plant.....	900,000.00
Harrison plant, lamp factory.....	200,000.00
	\$3,400,002.00

A summary of the changes in this account since the last annual report is as follows:

	Book value Jan. 31, 1900.	Cost of additions during the year.	Written off at the end of the year.	Book value Jan. 31, 1901.
Real estate.....	\$1,858,044.65	\$549,255.10	\$549,255.10	\$1,858,044.65
Machinery.....	1,541,965.85	846,420.28	846,420.28	1,541,965.85
Patents.....	1.00	82,865.46	82,865.46	1.00
Sundries.....	1.00	88,866.99	88,866.99	1.00
Totals.....	\$3,400,002.00	\$1,566,907.83	\$1,566,907.83	\$3,400,002.00

*Include office furniture and fixtures of the factories, horses and trucks, shop fixtures, benches, steam fitting above ground for heating system, sprinkler system for fire protection, electric wiring of buildings, etc.

REAL ESTATE.

(Other Than Factory Plants.)

This account represents the investment in the Edison Building, 44 Broad street, New York City; also a four story brick building covering five lots on the corner of Avenue B and 17th street, New York City, and sundry parcels of land in various places, mostly improved and rented, which have been acquired at various times, chiefly in payment of debts.

All are free from mortgages and will be sold when opportunities offer.

STOCKS AND BONDS.

In the book valuations of stocks and bonds remaining on hand since January 31, 1897, no material changes have been made since they were appraised four years ago. The book value of those not readily salable was then fixed, after careful examination of their worth at that time. Those having a market value are still carried under the price of then reported sales.

Those more recently acquired are carried at cost.

Schedules A and B annexed hereto contain lists of the most important of the company's hold-

ings of stocks and bonds. The total par value of all stocks and bonds owned by the company (other than those carried at one dollar as below explained), is \$13,128,766.20.

They are carried at an aggregate book value of..... \$6,012,191.20

Miscellaneous securities of many underlying, manufacturing, selling and patent owning corporations, and also of street railway and lighting companies, carried at one dollar for each lot, in all..... 109.00

Total book value of all stocks and bonds as per balance sheet..... \$6,012,300.20

I believe the present aggregate realizable value of the foregoing described securities is fully equal to the total amount of which they stand on the books.

Pursuant to the established policy of selling securities which there is no special reason for holding permanently, various stocks and bonds have been sold for cash since the last annual report.

Their total par value was \$1,384,375.00.

They were sold for..... \$1,070,272.03

They had been carried on the books at..... 651,205.23

Profit..... \$419,066.80

The money realized from the above sale of assets was expended to protect and improve existing investments by acquiring (at a cost of \$1,126,416.03) miscellaneous stocks and bonds of the aggregate par value of \$1,794,048.37.

NOTES AND ACCOUNTS RECEIVABLE.

This account represents the total debts now due the company.

They appear in the annexed balance sheet at an estimated realizable value—i.e. from their face, \$10,001,519.48 (which is less than the billed amount of goods shipped during the last 100 days of the year) has been deducted an allowance of \$404,131.95 for possible losses.

I believe this allowance to be a fair one and ample under existing general conditions of business in the country.

Sales During the Year.

The net amount of sales billed to customers during the year exceeded twenty-eight million dollars.

Of some 12,600 regular customers on the accounts receivable ledgers, there were debit balances against 4,900 at the close of the fiscal year.

Collections During the Year.

During the year the cash collections from notes and accounts receivable exceeded twenty-six and one-half million dollars.

On January 31, 1900, the face amount of notes and accounts receivable was \$7,314,930.12, all of which have been settled during the year except \$516,429.19.

	Notes receivable.	Accounts receivable.	Total face values.
Balances, Jan. 31, 1900	\$7,314,930.12	\$6,336,863.44	\$7,314,930.12
Of which there have been settled during the past year.....	767,528.68	6,030,972.25	6,798,500.93
Leaving unsettled or unmatured—originating prior to the current year—56 note accounts and 47 open accounts, on which there are allowed for possible losses \$224,887.85.....	210,588.00	305,891.19	516,429.19
The unsettled and unmatured balances of the current year are.....	1,518,002.56	7,967,087.73	9,485,090.29

Balances, face values, Jan. 31, 1901, exclusive of "dollar" notes and accounts..... 1,728,540.56 8,272,978.92 10,001,519.48

"Dollar" Notes and Accounts.

In addition to the above there are old notes and accounts receivable of two hundred debtors, aggregating \$1,281,087.90, which have been written off to profit and loss except the nominal book value of one dollar for each debtor. They stand on the books at a total of \$200 and are being liquidated gradually. The total amount realized from this class of notes and accounts by settlements made during the past year was \$18,070.78.

Allowances for Possible Losses.

	Notes receivable.	Accounts receivable.	Total.
On debts existing at Jan. 31, 1900, there was then allowed.....	\$72,191.31	\$264,928.51	\$337,119.82
Amount of such allowance absorbed during the current year, in effecting settlements (see foot note).....	32,276.91	164,534.57	196,811.48
Balance of allowance still standing on the old debts.....	\$39,914.40	100,393.94	140,308.34
Above allowance is now increased.....	25,292.07	63,298.44	88,590.51
Total allowance on old debts.....	65,196.47	163,692.38	228,888.85
Allowance for possible losses on unsettled and unmatured balances of the current year.....	16,936.36	158,306.74	175,243.10
Total present allowance for possible losses.....	82,132.83	821,999.12	404,131.95
Deduct total allowance from total face value.....	1,728,540.56	8,272,978.92	10,001,519.48
Book value of all above Add book value of "dollar" notes and accounts.....			200.00
Total book value as per balance sheet.....	1,046,407.73	7,950,979.80	9,597,587.53

In effecting these settlements there were realized \$127,486.87 over last year's book valuations, less \$5,029.06 loss in settling some debts below their appraised value. Net gain above appraised value, \$122,457.81.

WORK IN PROGRESS.

This account does not include outlays for anything in process of manufacture at the factories, but represents expenditures for labor, material, etc., at cost, on 586 uncompleted installations of finished apparatus in progress at various places..... \$1,280,938.60

Less partial payments thereon, received under the terms of the contracts as work progressed.... 226,280.03

Balance as per balance sheet.... 1,054,658.57

None of the estimated profit to be derived from these installations is included in the earnings of the year.

MERCHANDISE INVENTORIES.

These accounts represent actual inventories—counted and valued item by item—of raw materials and goods manufactured and in process of manufacture at the factories; of shipments in transit to storerooms of local offices; of manufactured goods in storerooms of local offices; of materials in local repair shops; and also of all goods on consignment.

Raw materials have been valued at the lowest price paid by the company during the last three months of the fiscal year. The market price prevailing on January 31, 1901, was used where it was lower than the lowest price paid by the company during the said three months.

Active selling finished and partly finished apparatus and supplies were valued at estimated factory cost; inactive or slow-selling apparatus and supplies at about 50 per cent. of estimated factory cost; and obsolete apparatus and supplies at scrap value.

At Factories.

On the above basis the inventories at the factories exceeded their book value. Such excess has not been taken as a profit, but has

been retained as a reserve against possible increased cost of manufacturing in case of further advance in prices of raw material.

At General and Local Offices.

During any fiscal year, goods are taken in and out of local office inventories at the estimated factory cost then prevailing. Consequently, at the close of that fiscal year, there must always be considerable change in book values of finished apparatus and supplies carried over—to adjust their inventory prices to latest estimated factory costs and to provide for losses due to returned articles, cost of repairs, breakages, boxing, reclassifying and writing down the book value of goods no longer quick-selling, etc.

The inventories of apparatus and supplies in all local offices showed a decrease under book value of \$59,030.80, which amount has been charged off to profit and loss.

Office Furniture and Fixtures.

The total appraised value of all office furniture and fixtures, machinery, tools, instruments, etc., in the general and local offices and in local repair shops is \$94,989.22. All these items are carried at a total book value of one-dollar.

Consignments.

Finished apparatus for novel uses has been delivered to various concerns subject to purchase if its operation is successful. The greater part of the consignment account represents such contingent sales, and the remainder represents apparatus on exhibition or loaned to regular customers for temporary use by them.

All such shipments are charged to this account at estimated factory cost. Their total is \$127,805.49. Less 50 per cent. allowance for depreciation 63,902.74

Net book value of consignments as per balance sheet... \$63,902.75

LIABILITIES.

The company has no note payable, nor is there under discount any paper bearing the company's indorsement or guaranty.

Since January, 1895, the company has not borrowed any money, nor at any time since that date has its credit been used either by issuing notes, indorsing customers' paper for discount or lending its name in any way; but by adhering to its established policy of maintaining sales on a basis of cash or short credit to desirable customers all purchases have been paid for in cash.

DEBENTURES.

At January 31, 1900, there were outstanding \$5,300,000. There were purchased for cash (average price \$1,270.83) during the year 3,000 \$5,297,000

All the debentures are on their face exchangeable for stock at the option of their holders, at the rate of \$100 of stock for \$120 of debentures. During the year the holders of 3,763 debentures surrendered them and 31,243 shares of stock were issued therefor 3,763,000

Leaving debentures outstanding at this date \$1,534,000

ACCRUED INTEREST ON DEBENTURES.

This account, as its name implies, is the full amount of 5 per cent. interest accrued to January 31, 1901, on the company's \$1,534,000 outstanding debentures.

UNCLAIMED DIVIDENDS.

This account represents the full amount unpaid on all dividends declared and payable to January 31, 1901, inclusive—the addresses of a few stockholders being unknown.

ACCOUNTS PAYABLE.

This account includes all unpaid audited indebtedness.

At the close of business on January 31, 1901, the unpaid vouchers on hand—none of which was then due under the terms of purchase—amounted to \$78,428.57

Between January 31 and February 26, 1901, the date of closing the general books, additional liabilities belonging to the past year were audited, amounting to 742,021.78

Total as per balance sheet \$820,450.35

The amount of unpaid vouchers carried over monthly—by keeping the books, other than the cash book, open a sufficient time to include each month's obligations in that particular month—has averaged during the year about \$920,000. Respectfully submitted,

J. P. ORD,

Second Vice-President.

REPORT OF THE ACCOUNTANTS.

New York, April 20, 1901.

To the Board of Directors of the General Electric Company.

We have examined the account books and vouchers of the General Electric Company, the Edison General Electric Company, the Edison Electric Light Company, and the Thomson-Houston Electric Company, for the year ending January 31, 1901, and have verified the consolidated profit and loss account and the balance sheet published herewith.

The vouchers covering the whole of the expenditures for the year are full and clear. The bookkeeping is sound in principle and very accurate in detail.

The valuations of assets used in determining and verifying the profits, and which appear in the balance sheet, are made with the same care as in previous years.

Our examination of the merchandise inventories has satisfied us that the method of valuing these described in the report of the Second Vice-President, has been adhered to throughout. The excess of inventory value

over book-value constitutes in our opinion a sufficient provision against any contingency in connection with inventories valued in so careful a manner, and in a business so active as that of your company.

The valuation of accounts and notes receivable appears to us to be made in the same manner as in previous years, and heretofore the actual realization of these assets has exceeded the valuation in the published accounts.

The remarks upon the valuation of accounts and notes receivable practically apply to the valuation of stocks and bonds owned. The conversion of these into cash is of course more gradual, but in the meantime the total valuation is justified by the volume of the interest and dividends received.

Comment on the balance sheet valuation of factory plants and patents is scarcely needed. The additions to these assets during the past year, which have been written off to leave the valuations the same as at January 31, 1900, and which are set out more fully in the report of the Second Vice-President, amount to almost half the present valuation of these assets in the balance sheet. This fact, together with their obvious extent and earning power, abundantly establishes the safety of the valuations of plants and patents.

The same care as heretofore has been used to include in the balance sheet all known existing liabilities.

PATTERSON, TREELE & DENNIS,
Certified Public Accountants.

THE PAN-HELIO-MOTOR.*

BY R. M. W.

The other day I called upon Dr. Halver, of Washington, to hear all about his new prime mover, the "Pan-helio-motor." The mere name of this machine is to me a source of great delight, the syllables seeming to issue from one's lips like a song. There is none of the harshness that is to be found in such words as "automobile" or "traction-engine" or "liquid air motor," to say nothing of some German machines with names like—well, perhaps they are better left undescribed. But "Pan-helio-motor!" It is a chant, a carol; try it for yourself the next time you are quite alone, and you'll agree with me. However, that is a digression, and I must proceed to the description of the machine itself and of what it can do. I was shown at once into Dr. Halver's "backyard," which was a large and well laid-out garden of about two acres in extent; but this, all the same, is a "backyard" in America. The Doctor was rather taken aback at my sudden appearance, as he was in rather scant attire—in fact, he had nothing on but a bathing suit and a shining silk hat. I introduced myself, and after a few minutes' chat I felt quite at home.

"You must feel the heat a good deal Doctor," said I, as a sort of apology for the fact that I could not keep my eyes off his somewhat strange rig-out.

"Yes," said the Doctor, "I do feel it a good deal, although I have discovered the proper way to dress for this kind of work. You are no doubt surprised to see me wearing this silk hat?"

I signified that I was, somewhat.

"Well," he explained, "this hat is such a perfect reflector that it throws off and scatters

From "Lighting," London, Eng.

the sun's rays from my head in the same way that my machine collects and concentrates them. I had a complete suit made out of old silk hats, but, although it was very cool, it was not of a sufficiently flexible material to give any great degree of comfort in wearing it, so I fell back upon this old bathing suit which I used at Manhattan last season. I find it answers very well, although it's not anything like so 'dressy' as the silk hat suit."

I perceived at once from the foregoing conversation that I had a genius before me, and became impatient to get at the real object of my visit, the pan-helio-motor itself. The Doctor was very quick to notice my impatience, more by the acuteness of his observation than from the fact that I had unintentionally kicked him several times on his bare shins in my restlessness to get to the bottom of the "yard," where, I could see, the apparatus was erected. At last we arrived at the wonderful machine itself, and I began to ask the Doctor a few leading questions, as he showed that diffidence in explaining his discovery which is so common to all inventors, especially American inventors.

"What are the main features of your machine?" I asked.

"The main features," he replied, "is the enormous amount of heat which I can generate with my apparatus."

"Excuse me," I remarked, "but does not the sun generate the heat, your apparatus merely collecting it and concentrating it upon a particular spot?"

The Doctor seemed a little ruffled at my question.

"I was not aware," he replied, "that you were a scientific man, or I should never have allowed you to see my apparatus. I never explain it to scientific men."

I thought this was a very safe line for the Doctor to adopt; I did not say so, but proceeded to disclaim any special scientific knowledge on my part. Somewhat reassured, the Doctor proceeded to explain how his apparatus could reflect the sun's rays on a focusing spot, and burn down a rocky mountain without so much as lighting a match. I was particularly struck by the great usefulness of a machine which could perform this miracle, which the Scriptures set pretty high up on their list of difficult things to accomplish.

"Do you find much demand for the burning down of rocky mountains around here?" I asked.

"In the meantime," he replied, "business in the rocky mountain line is not very brisk, but I expect a large number of orders shortly when my invention becomes better known to the proprietors of such nuisances as rocky mountains."

"Your invention is bound to prove most useful to railway engineers," I took the liberty to remark. "For instance, the burning of a hole through a mountain for a railway line to run through would be quite a simple matter, I suppose."

"Oh! certainly," said the Doctor, "the merest trifle."

"Is it the case," I asked, "that the melting of silver coins, glass tumblers, diamonds, etc., is performed almost instantaneously by your machine?"

"Yes," said the Doctor, removing his silk hat for a moment to mop his brow with a loose corner of the bathing suit, "all these and many other operations of equal usefulness are easily

done by the pan-helio-motor. The bricks I can make by my heat are so hard that one of them would smash a navy's pick into a thousand pieces if he got in a good blow at it. This is a discovery invaluable to electrical engineers, for instance, who had given up looking for a material which would resist a pick. To protect their mains all they will have to do will be to put a layer of my bricks over the cables, and I guarantee that the average navy will give up trying to get through to the wires after he has splintered his fourth pick."

I at once appreciated this point, as I am acquainted with a superintendent of electric mains, and have heard him discourse most forcibly on this very subject more than a few times. I was so grateful to the Doctor for giving my friend a chance of leading a less sulphurous existence in the future that I asked him on the spot to join me in a little refreshment at the nearest bar. He thanked me cordially, but refused, on the ground that his costume was apt to attract more public notice in the streets than could be desirable, even to an inventor. I at once saw the difficulty in which he was placed and postponed the adjournment to a more suitable occasion.

"Now, for a few experiments," said the Doctor, and grasping the controlling levers which actuated the reflecting mirrors, he directed the concentrated heat on a soaking wet plank of wood, and immediately the plank burst into flame. By regulating the heat to a slightly less intensity, about a dozen holes were bored through the plank before I had time to say 'cocktail.'

"What do you think of that?" said the inventor.

For a moment or two I stood speechless with wonder, but the Doctor reduced his heat by a few thousand degrees and playfully burned a small hole about three-sixteenths of an inch in diameter and about one-half inch deep in the calf of my left leg, which quickly wakened me out of the brown study into which I had fallen.

"Wonderful," I replied, carefully plugging up the hole with a square piece of lead pencil so that I might have something tangible to show my friends when telling them of my strange experiences. The Doctor then gave me an inkling of what will be the order of things when his sun-motor becomes generally used. Coal will probably be a thing of the past as a fuel, as the pan-helio-motor will be very much cheaper, since it enables the heat of the sun to be controlled by a couple of levers. A pan-helio-motor in our backyard will enable us to do away with coal-bins, ash-bins and wood-sheds, as coal fires will be quite out of date. The absence of the coal merchant's bill will be a pleasing feature of every home. In order to provide for the time when the sun is not available, the Doctor has invented a heat reservoir, but the principle of this reservoir is, I understand, a secret, which the inventor guards so jealously that he has not patented it, showing again that Dr. Halver "knows a thing or two." The heat is drawn off "like beer from a cask" from the tank containing the heat storing minerals. "Of course," the Doctor explained to me, "it is not absolutely necessary to use the heat reservoir, as the heat can be used to generate steam and drive dynamos, when the power so obtained can be stored by storage batteries. This, of course, would be quite a cheap method, but not a bit cheaper than storing the heat itself by means of the reservoir." From some remarks my friend, the main

superintendent, had let fall in my hearing a few days before I had my doubts about the cheapness of the electrical method of storing. I thought it better, however, to say nothing of this to Dr. Halver, remembering his antipathy to anyone having, or pretending to have, scientific knowledge.

I made one remark to the Doctor, however, before leaving him, which I could see had set his inventive brain on a new tack.

"This invention," I said, "is a splendid idea where there is plenty of sunshine, but what about the countries where there are five days of rain to one of sunshine? If you could invent a 'pan-pluvio-motor' which would gather up and concentrate all of the energy possessed by the falling drops of rain, and turn them to a useful purpose, you would confer a blessing on the people of Great Britain, for instance, which would cause them to have a bronze statue erected to you in almost every town in the world."

"I'll think it over," said the Doctor.

I left him thinking, an interesting figure, with his silk hat crushed down over his ears, and the loose edges of his bathing suit flapping gently in the breeze.

"Electricity's" Educational Series.

BY R. MAX EATON.

ARTICLE NO. 25.

THE TELEPHONE AND TELEPHONE PRACTICE. (Concluded.)

Private telephone systems for factories, warehouses and offices have become quite a feature in the telephone industry, so much so that a number of manufacturing companies have devoted themselves almost entirely to the production of apparatus for that purpose.

A great deal of trouble is being experienced by the users of such systems and it is a very small percentage of the plants installed which give entire satisfaction and continue to do so. In four cases out of five the trouble is in the installation and not the fault of the instruments. There are very few instruments on the market but what will work entirely satisfactory if properly installed and are allowed to work under the conditions in which they

FIG. 1.

are intended. Very often the blame is placed on the transmitters, in fact, it is a usual thing for this to be done. That is nonsense, however, because any of the standard make of transmitters give excellent results if properly installed and operated.

When installing an interior or isolated plant the following points should be remembered:

When cable is used, always use cable which is made up of twisted pair conductors.

Never use what is known as "parallel" or "telegraph" cable for telephone work. It has no transposition of conductors.

It is advisable to use twisted pair wire in all telephone work.

FIG. 2.

Use the same precaution installing telephone cable that is required in electric light work.

Never fasten wires with double pointed tacks.

Solder all joints.

Do not use too heavy wire. It is not necessary and is clumsy to connect to instruments.

Connect instruments up the way they are intended to operate. Never use local battery instruments on common battery work. They will not give satisfaction.

FIG. 3.

When receivers are connected direct in the talking circuit, as in some common battery systems, they should be wound to low resistance. High resistance receivers are used with perfect satisfaction in secondary circuits only.

the button is closed, cutting out the resistance of the transmitter and receiver.

Fig. 2 illustrates a two station line with two local battery instruments operating on an individual battery. When a button is pressed

FIG. 4.

On intercommunicating local battery work of more than two instruments, do not use the same battery for feeding the transmitters, except when a storage battery is used. "Cross talk" will exist if you do.

at either station, both bells ring in multiple. This is not a satisfactory equipment except on a short line of not more than two or three hundred feet.

Fig. 3 shows how the same battery may be used for supplying a number of local battery sets, provided they are placed on one talking circuit. In a case of this kind, with a number of instruments on a circuit, it is not advisable to use the same battery for operating vibrating bells, for if a bell is being rung when the instruments are being used the disturbance on the battery will very much interrupt their working.

Fig. 4 describes the method of connecting common battery instruments on one talking circuit. The instruments are connected in multiple with the battery, which is fed to the circuit through a retardation coil. In such cases as this, if the same battery is used for ringing vibrating bells, the connections must be made back of the retardation coil. If this was not done the inductive spark from the effect of the coil would burn the contacts on the bells and also it would be impossible to talk over the circuit if the bells were being used.

On the intercommunicating systems oper-

ing with a common return wire it is practically out of the question to try and prevent "cross talk." On large systems it is not good practice to adopt the common return method. Most of the recognized systems provide for a metallic circuit multiple of every instrument to each instrument.

For isolated plant work, common battery systems give much the best results.

Article No. 26 will be entitled "Suggestions for the Telephone Inspector."

AN ELECTRIC FURNACE FOR THE MANUFACTURE OF CALCIUM CARBIDE.

On April 16th there was issued from the United States Patent Office a patent covering a new type of electric furnace. This fact in itself would not have caused any special comment, for patents for improvements in electric furnaces are quite common, but when it became known that it was the long expected and much talked of carbide furnace of the Columbian Carbide Company, electricians throughout the country became at once highly interested. It would seem to be the consensus of opinion so far that a successful type of continuous furnace has at last been reached. The Columbian Carbide Company has been secretly experimenting for some time past in the manufacture of calcium carbide and it is said also has other processes, the result of their long research, which will appear from the Patent Office shortly.

FIG. 1.

The furnace is the invention of Francis Jarvis Patten and a description of its principal features should prove of interest. The furnace is of the "open-hearth" type, the electric arcs playing downward against an open furnace-floor, the process being plainly open to view. It is in a sense a multiple furnace, as there are two or more furnace-floors.

Referring to Fig. 2, the ground plan is of a circular form, and the furnace floors or hearths $F^1 F^2 F^3$ are sectors of the circle of about 70 degrees of arc each, thus leaving 50 degrees of arc open space between the three floors. These hearths or "furnace floors," as the inventor styles them, are revoluble about a central post or supporting-axis P , Figs. 1 and 2, revolving on a hinge $H^1 H^2$, Fig. 1, which surrounds the supporting-post, and further supported at the outer rim of the floor by resting upon ball-bearings LL , that are held in a pair of concentric circular grooved tracks TT , Fig. 1, which give the furnace-floor substantial support. All the floors can be swung completely around the circle; but there are three working positions to which each floor in turn is successively removed, chasing each other from one stage of operation to the next. Two of these positions are working positions

for the electric arcs, while the other has no arcs and is a charging position. From the charging position the floor is moved, with its charge of lime and coke, to the next position, where the preliminary heating is done with a number of arcs of comparatively low power. This done the floor moves to the third position, where the actual smelting is done, and then to the first position, where the product is re-

FIG. 2.

moved and a new charge is placed on the floor. In each of the arc working positions the floor on arrival at the central line is clamped to a tangent screw apparatus S^1 , Fig. 2, by means of which the floor may be swung backward or forward circumferentially by a distance of about half its breadth.

The arrangement of the carbons is shown in Fig. 1. Two or more sets are suspended from a swinging arm K over the two working floors. These arms or carbon-carriers are revoluble about the central post P just the same as the floors and can be turned circumferentially at will to any position; but when the floor is in the working position the arm or carrier K is clamped centrally over the floor and is not moved circumferentially while the arcs are working. Two sets of carbons C^1 and C^2 are shown supported on the arm K , which has a vertical slot along its middle line. In this slot the actual carbon-holders are fixed in such a way that they can be moved along the arm to

FIG. 3.

or from the central post radially. This movement is effected by turning the hand-wheel W^1 and screw S^1 , which, being itself fixed and passing through the screw-threaded blocks $B^1 B^2$

at the tops of the carbon-carriers causes the carbons and their arcs to be traversed radially over the furnace-floor. This arrangement is plainly seen in Figs. 1 and 3. Thus there are two movements at command—a circumferential one of the furnace-floor and a radial one of the arcs. Evidently by using both the arcs can be placed immediately over any particular spot of the floor, and thus made to act upon any part of the charge it may be desired to reach.

The carbon system and their arrangement are shown in Fig. 3. Two carbons in each set are inclined to each other in such a position that the arc between them is just over the furnace-floor. Between the carbons, with its poles across or bridging the arcing space, is a powerful electromagnet $M^1 M^2$, Fig. 1, and this magnet when excited blows the arc down, as shown, in a pointed and vertical stream of flame against the charge X of lime and coke below and which the carbons themselves do not touch. In the boxes R^1 and R^2 , Figs. 1 and 3, is placed suitable regulating mechanism for feeding the carbons as they are consumed.

The essential features of the furnace, then, are the multiple furnace floors horizontally revoluble about a common center, the multiple carbon system for two of the three floors, the

FIG. 4.

carbons being movable radially at will in a horizontal direction parallel to and just over the furnace-floors, and the magnetically-deflected arcs directed from the carbons downward against the charge on the furnace-floors.

When using three arcs over each floor, tri-phase alternating currents are used, one of the three currents being through each pair of carbons, as indicated by the diagram of circuits in Fig. 4. In which each of the separate pairs of carbons $C^1 C^2 C^3$ is given one of the independent alternating currents of the triphase currents delivered by the dynamo (shown in the diagram) by the field-poles $N^1 S^1$, armature

FIG. 5.

A^1 , and terminal rings R^1 to R^4 . When using two carbons, biphasic alternating currents are used, one current going through each pair of carbons, as indicated by the diagrams of circuits in Fig. 5. The system is thus exceedingly flexible, as it enables one to use an ordinary biphasic alternator for the source of electricity, and then passing the currents from it through a suitable transformer. The volts and amperes are changed to suit the requirements of the work.

Committee on Standardizing.

The Committee on Standardizing of Street Railway Equipment, appointed at the recent meeting of the Executive Committee of the American Street Railway Association, has begun active work with a view of presenting a comprehensive report on the subject at the annual meeting of the Association in October next. T. E. Crossman has been appointed secretary to the committee, and he, in conjunction with the members of the committee, will visit some of the leading manufacturers of street railway equipment to ascertain their views on the subject of standards. The members of the committee are John R. Graham, Lynn and Boston Railroad Company, Boston; N. H. Heft, Meriden Electric Railroad Company, Meriden, Conn.; Willard J. Hield, Twin City Rapid Transit Company, Minneapolis; C. F. Holmes, Metropolitan Street Railway Company, Kansas City; Frank G. Jones, Memphis Street Railway Company, Memphis. They request that all who are interested in the subject will correspond with the secretary of the committee, whose address is 1829 Park Row Building, New York, prior to May 20, at which time a meeting of the committee will be held in Buffalo.

A Novel Scheme for Pan-American Exhibitors.

Mr. W. Jac. Marland of 132 Nassau street, New York City, informs us that as the Curator of a Collective Electric Exhibit Section, Electricity Building, Pan-American Exposition, it will be his duty to take care of exhibits for firms desirous of showing their goods, who do not care to go to the expense of an individual exhibit, and in this connection, he is prepared to make arrangements to allot space in this Collective Section for sums of \$25 and over, according to the amount of space required and current consumption of the exhibit; this includes the caring for and demonstration of the exhibit and the handling of any circular matter.

The following firms have arranged with Mr. Marland to represent and exhibit for them during the Exposition: Charles J. Bogue, Edison-Johnson Electric Mfg. Co., Dunn-Martin Electric Co., Thomson Electric Welding Co., H. C. Cushing, Jr., Prentiss Clock Improvement Co., Power Installation Company, F. B. Sage & Bro., The Diamond Arc Lamp Co., Harold P. Brown, Emile J. Fardie, H. P. Cameron Electric Mfg. Co., William Roche, Smith & Hemingway, Parsell & Weed, Standard Welding Co., Electric Contract Co., Queen & Co., Boston Extension Tap Co.

It will be readily appreciated that the specialties of these firms will make an elegant exhibit and Mr. Marland's Collective Section will be one of the great attractions of the Electricity Building.

Mr. Marland's idea is quite unique and original, as he proposes to have each specialty work one upon the other so far as prevailing conditions will permit.

Legal Decision on a Stanley Patent.

JUDGE COXE, in the United States Circuit Court, Northern District of New York, has just handed down a decision in favor of the complainant in a suit brought by the Westinghouse Electric & Manufacturing Company against the Saranac Lake Electric Company, which uses electrical transformers manufactured by the Stanley Electric Company of

Pittsfield, Mass. The decision sustains the patent of Stanley, which had been assigned to the Westinghouse Electric & Manufacturing Company. The inventor, Stanley, at the time of making the invention was associated with the Westinghouse Company, and it is understood that the patent covers practically all commercial systems of alternating current distribution for electric lighting and power.

Not Badly Injured by Fire.

We have received the following card from the B. F. Sturtevant Company, Jamaica Plain, Mass.: "The fire which visited our works on Sunday, April 14, injured only our engine and electrical departments. Our drawings, correspondence and office records are all intact. The entire blower, heater, forge, galvanized iron and shipping departments with the foundry, pattern shop, etc., are in full operation and shipments going forward as usual. Tools are on the road and arrangements already made for immediately re-equipping the engine and electrical departments. We are prepared to take orders for engine and electrical work, and fill same within reasonable time."

PERSONAL MENTION.

Mr. Joshua Rhodes was recently made president of the Pittsburg, Pa., Consolidated Traction Company, and W. Kesley Schoepf succeeds him as vice-president.

INCORPORATIONS.

The Thames Electric Company, New London, Conn. Capital stock, \$2,500.

The Electric Railroad Construction Company, Perth Amboy, N. J. Capital stock, \$100,000. Incorporators: Sidney Riddlestoffer, A. Clayton Clark and William A. McCoy.

The Electrical Specialty Company, Baltimore, Md. Capital stock, \$1,000. Incorporators: Augustine M. Hopper, Cecil N. Money, Edwin W. Poe, Jesse Slingluff and Carroll T. Bond.

The Ticonic Construction Company, Waterville, Me.—to carry on general contracting business in electric light, power and traction plants, water plants, etc. Capital stock, \$10,000. Officers: President, Everett M. Stacy; treasurer, Horace Purinton, both of Waterville.

The Hudson River Electric Company, Albany, N. Y.—to construct dams across the Hudson River in Saratoga, Warren and Washington Counties and elsewhere, and to furnish light, heat and power to cities, towns and villages in Saratoga, Washington, Fulton, Montgomery, Rensselaer, Albany, Schenectady, Essex, Clinton, Franklin and other counties. Capital stock, \$1,000,000. Directors: C. H. Pedrick, Jr., and J. M. Warren, Spier Falls; Henry W. Williams, Robert de Long and F. G. Baker, Glens Falls.

ELECTRICAL PATENT RECORD.**LETTERS PATENT ISSUED APRIL 23, 1901.****ELECTRIC RAILWAYS AND APPLIANCES.**

672,658. Trolley for Electric Railway Cars. August Schneider, Lexington, Ky., assignor of one half to Frederick R. Toe Water, same place. Filed Oct. 15, 1900.

672,741. Electric-Railway Trolley. Charles H. Myers, Buffalo, N. Y. Filed Nov. 30, 1897. Renewed Sept. 8, 1900.

672,831. Trolley. William W. Hoffman and Francis W. Powers, West Lafayette, Ind. Filed Oct. 1, 1900.

ELECTRIC LIGHTS AND APPLIANCES.

672,451. Electric-Light Vacuum-Tube. Daniel M. Moore, Newark, N. J., assignor to the Moore Electrical Company, New York City. Filed March 28, 1898.

672,452. Electric-Light Apparatus. Daniel M. Moore, Newark, N. J., assignor to the Moore Electrical Company, New York City. Filed April 15, 1898.

672,489. Supporting Device for Electric Lamps. Edwin J. McAllister, Almon D. Page and Louis C. Werner, Newark, N. J., assignors to William Farley Brewster, New York City. Filed Jan. 11, 1901.

672,597. Electric-Arc Lamp. Albert De Puydt, Liege, Belgium. Filed Dec. 4, 1900.

672,639. Conductor and Contact for Electrical Glow-Lamps. Julian A. Halford, Bayswater, Eng., assignor to the

Electric Lighting Boards, Limited, London, Eng. Filed Jan. 21, 1901.

672,642. Electric Incandescent Lamp. Louis J. P. Hollub and Henry Mignol, Paris, France. Filed Nov. 8, 1900.

672,770. Electric Arc Lamp. Charles Holmök and Julius Holmök, Cleveland, O. Filed Jan. 21, 1901.

672,877. Electric-Lighting System for Railway-Cars. James W. Guillott, Chicago, Ill., assignor to George W. Cass, trustee, same place. Filed May 15, 1896.

672,878. Electric-Lighting System for Railway-Trains. James W. Guillott, Chicago, Ill., assignor to George W. Cass, trustee, same place. Filed July 20, 1896.

ELECTRICAL MACHINERY AND APPARATUS.

672,513. Electric Switch. James Reid, Jr., Watervliet, N. Y., assignor to the Consolidated Car Heating Company, Albany, N. Y. Filed Jan. 28, 1899.

672,583. Electrical Switch. William F. Bossert, Utica, N. Y., assignor to the Bossert Electric Construction Company, same place. Filed Dec. 4, 1900.

672,440. Automatic Booster in Connection with Multiple-Wire-Systems. John S. Highfield, St. Helena, Eng. Filed Feb. 2, 1901.

TELEPHONES AND TELEPHONE APPARATUS.

672,546. Telephone Metering System. Donald M. Bliss, Lowell, Mass., assignor to the Automatic Telephone Meter Company of New Jersey. Filed Nov. 27, 1899.

672,621. Telephone Transmitter. Charles C. Hughes, Baltimore, Md. Filed April 14, 1900.

672,162. Desk-Telephone. Albert K. Andriano, San Francisco, Cal., assignor to the Automatic Interconnecting Telephone Company, Incorporated, same place. Filed Sept. 23, 1899. Renewed Sept. 17, 1900.

MISCELLANEOUS.

672,449. Electrical Conductor. William A. Markey, Saginaw, Mich., assignor to Emmet T. Bowen, same place. Filed Aug. 31, 1900.

672,466. Adjusting Mechanism for Rolling Mills. Richard Wayland-Smith, New York City. Filed Oct. 1, 1900.

672,503. Accumulator-Battery. Pascal Marino, Brussels, Belgium. Filed April 10, 1900.

672,589. Interior-Conduit Capping. William F. Bossert, Utica, N. Y., assignor to the Bossert Electric Construction Company, same place. Filed Feb. 13, 1901.

672,601. Tapping Device for Electric Furnaces. Oscar Frolich, Steglitz, near Berlin, Germany. Filed May 15, 1899.

672,608. System of Electric Distribution. Albert F. Hubbard, Belleville, N. J., and Rufus N. Chamberlain, Depew, N. Y., assignors to the Gould, Storage Battery Company, New York City. Filed March 13, 1901.

672,604. Commutator-Brush and Brush Holder. Robert Landell, New York City. Filed Oct. 10, 1900.

672,606. Insulated Railroad Rail Joint. George A. Weber, Stamford, Conn., assignor to the Weber Railway Joint Manufacturing Company, New York City. Filed Dec. 7, 1900.

672,626. Railway-Signal. Jonathan D. Price, Aurora, Ill., assignor to Miller Signal Company, Chicago, Ill. Filed April 11, 1900.

672,629. Telautograph. George S. Tiffany, Highland Park, Ill., assignor to the Gray National Telautograph Company, Richmond, Va. Filed Aug. 26, 1898.

672,630-672,631. Telautograph. George S. Tiffany, New York City, assignor to the Gray National Telautograph Company. Filed Nov. 22, 1900.

672,637. Process of Treating Zinc-Bearing Ores for Obtaining Zinc, etc. Sherard O. Cowper-Coles, London, Eng., assignor to the Cowper-Coles Metal Extraction Syndicate, Limited, Melleenar Haecyle, Eng. Filed July 23, 1898.

672,665. Coin Controlled Electrotherapeutic Machine. Winfield S. Bosley, Chicago, Ill., assignor to the Mills Novelty Company, same place. Filed July 2, 1900.

672,712. System of Electrodynamical Propulsion. Leon Rosenfeld, Constantin Ze'eny and Julien Dulait, Charleroi, Belgium. Filed Jan. 31, 1900.

672,715. Galvanic Battery. Charles B. Schoenmehl, Watervliet, Conn., assignor to the Watervliet Battery Company, same place. Filed Oct. 30, 1900.

672,727. Means for Protecting Commutators. Alfred de Veau Baldwin, New York City. Filed Feb. 14, 1901.

672,753. Spark Arrester. Larkin L. Crump, Westpoint, Miss. Filed July 17, 1900.

672,830. Railway Signal System. William W. Hoffman and Francis W. Powers, West Lafayette, Ind. Filed June 6, 1900.

672,841. Electric Mallet or Hammer. Charles D. Olsen, Denver, Col. Filed Jan. 18, 1900.

672,851. Electrical Transmission of Motion for Steering Ships or for Other Purposes. Harry A. Spiller, Boston, Mass., assignor, by mesne assignments, to the General Electric Company, Schenectady, N. Y. Filed Oct. 30, 1891.

672,875. Sparking Igniter for Explosive-Engines. Abraham Lath, New York City, assignor to the Safety Three-Wheel Vehicle Company, same place. Filed Feb. 17, 1900.

THE TELEPHONE WORLD.

Rural Telephones Have Covered Kansas.

A telephone directory of the independent exchanges and toll stations in Central Kansas has been issued, which reminds one of the fact that as late as 1895 there was not an independent company in Kansas and what few exchanges and toll stations there were at that time were operated by the Bell Telephone Company, and the prices were so exorbitant that a telephone was a luxury instead of the necessity as it is to day.

After the expiration of the Bell patents, companies were organized and exchanges were built, and to-day there are in Kansas over 300 large exchanges with from 150 to 600 subscribers each, besides almost every town and village east of Great Bend is connected with the outside world by telephone toll stations. These exchanges and toll stations are operated by about 150 different companies, capitalized at from \$5,000 to \$15,000 each, and the companies combined control over 5,000 miles of wire, and have thousands of subscribers.

The farm line systems this year will be one of the biggest parts of the telephone construction. These systems are built by the independent companies where a sufficient number of subscribers can be secured to warrant the building of the line, and before long the Kansas farmer will have telephones and can call up the nearest elevator to ascertain the price of wheat and other products of the farm without being compelled to haul his truck to town only to find a disappointed market for his stock.

In a very short time the Pennsylvania Railroad will have a long distance telephone line extending from Philadelphia to Pittsburg. Already the company has a line completed from Harrisburg to Altoona and there are stretches of wires between important points on the Pittsburg division. There is at present a line from Philadelphia to Columbia, and it is proposed to extend it to Harrisburg. Thus a line will be established between Philadelphia and Altoona. Then work will be started on joining the western lines to the eastern in order to complete the big loop. In time every part of the big system will be in communication by telephone with the central offices. The line on the middle division has proven a great convenience. There were those who did not approve of it when it was built less than two years ago, but every man along the line appreciates its advantages now.

The Southern New England Telephone Company, which recently purchased the local telephone system in Ansonia, Conn., will discontinue the local service of the old company on July 1. The subscribers who have only the instruments and service of the Ansonia Telephone Company can contract with the Southern New England Telephone Company for Southern New England Telephone service, such contract to begin July 1, 1901, and the Southern New England Telephone Company's instruments and service will be supplied to them in place of the Ansonia service from now until July 1, 1901. A modern switchboard equipped for 300 circuits, with a capacity of 1,000, has already been ordered at an expense of over \$3,000, and wires are to be put in conduits underground.

The Tyler, Tex., city council has granted a franchise to the Tyler Telephone Company to put in a system of telephones. S. F. Richardson, from San Antonio, will immediately begin the work of putting in the new line. This is the same company which has recently put in a system at San Antonio and Austin. The franchise stipulates that the new company cannot charge more than \$3 for business and \$2 for residence telephones.

A long legal battle is impending between the Wisconsin Telephone Company and the city of Kenosha. Acting City Attorney John C. Slater was ordered to prepare an ordinance compelling the telephone company to place all wires in the business district under ground. The ordinance it is thought will be passed at the next meeting of the city council. The telephone company has given notice that it will fight the claims made by the city and has refused to make any further concessions.

The Trempealeau & Buffalo County Telephone Company of Wisconsin has received its papers of incorporation. The officers of the company are C. H. Cooke, president; Ed. Jackson, secretary; Ole Pederson, treasurer, and A. J. Bauth, general manager. The line will run from Independence to Gilmanton. Work will commence shortly.

The Bell Telephone & Telegraph Company of Mobile, Ala., has asked and been granted permission to put its wires in a conduit in the business quarter of the city. This will greatly improve the appearance of the streets, reduce the fire risk, and improve the telephone service.

Telephone Line in Liberia, Africa.

News has been received at Washington, D. C., from Minister Smith, who reports from Monrovia, February 24, that T. J. R. Faulkner, a civil engineer from the United States, has placed that city in telephonic communication with White Plains, a settlement 25 miles up the St. Paul's River. This is the longest line in the country.

The Providence R. I. Telephone Company has begun making the improvements needed to give an adequate service between the Valley exchange and that city. With only four trunk lines between Riverpoint and Providence, the delays in securing connections with Providence subscribers, with whom the Valley telephone users do the bulk of their business, have been the cause of much and long-continued annoyance. Over 100 miles of new iron wire will be strung, and when completed the new lines will afford eight instead of four circuits as at present.

The directors of the Citizens' Telephone Company of Grand Rapids, Mich., have authorized the construction of additional copper circuit toll lines in the northern part of the State. The farmers in the vicinity of Hastings, Lowell, Rockford and Cedar Springs, will get an increased service of about 60 miles soon. The board has arranged for the purchase of considerable new equipment.

Arrangements are being made to build a telephone line from Donnellson to Courtright's Corner, Ia., six miles north, to connect with the Salem line, which runs from Salem to La. Crew. If this is done Donnellson will have direct communication with La. Crew, Mt. Hamill, Salem and all the farmers along the line.

The Home Telephone Company, of Oskaloosa, Ia., a corporation of business men of that city, has transferred its property to a corporation consisting of Senator H. H. Evans, of Aurora, Ill.; W. H. Dunsmore, of Oskaloosa; E. R. Conkling, of Joliet, Ill., and M. Slusser, of Downer's Grove, Ill. The new company has over \$5,000,000 invested in telephone properties in Ohio and Illinois.

After to day there is to be a reduction in the telephone rates about Gardner, Mass. The measured service will be done away with entirely. Those who have been using \$25 measured service will be given unlimited service at the same charge. A 10-party line will be established for \$18, with unlimited service. Two and three party lines will not receive any reduction.

From Syracuse, N. Y., comes the report that the Central New York Telephone & Telegraph Company has begun work upon the improvements of the local service of the company upon which \$70,000 will be spent. Over 100 men will be employed in subway construction and the extension of cable lines to all parts of the city. The work will occupy several weeks.

A. L. Lowrey and others have applied to the city council of Hillsboro, Tex., for a franchise for a local independent telephone exchange. It will be passed on by the council at its first meeting this month.

At a special meeting of the board of selectmen of Marblehead, Mass., a franchise was granted the New England Telephone & Telegraph company to set poles and string wires through certain streets and locate an exchange in that town.

There is a rumor that the Sumner and Paris, Mo., Telephone Company, will soon begin setting poles for a line across country from Sumner to South Paris.

The People's Telephone Company has been granted a franchise in Plainwell, Mich. Work on construction will begin at once.

The Colorado Telephone Company will expend \$600,000 in extending and improving its lines in Colorado and Wyoming.

The Forman, N. D., Telephone Company will build a branch line between Forman and Havara in July.

A rural telephone line is to be built by Pennsburg, Pa., capitalists.

The local telephone system in Monticello, Mich., is nearly completed.

It is said that the telephone line will be extended from Gold Hill to Crescent, Ore.

The newly incorporated Watkins, N. Y., Telephone Company was authorized to build, maintain and operate a first-class telephone system within the limits of that village at a regular meeting of the village trustees held recently. The ordinance authorizing the company to construct was unanimously adopted. There are several conditions upon which the franchise is granted, one of them being the maintenance of two instruments for the use of the village authorities, to be placed wherever the trustees shall direct. The company is to give a bond in the sum of \$3,000 to indemnify the village against damages that may result from the construction and maintenance of the system. The company at present consists of B. G. Hubbell, J. H. Fuller and C. B. Stone, all of Cleveland, O. Work must be begun within ninety days, or the franchise will be declared void. These directors are the same men who recently applied for the telephone franchise in Elmira, N. Y.

According to the New York "Commercial," the fate of the Erie telephone system, control of which is now held by the Old Colony Trust Syndicate of Boston, which interests are friendly to the Bell, is a matter of considerable speculation. It has been reported that the Telephone, Telegraph & Cable Company of America would attempt to regain the control lately surrendered. The officials of the independent company deny this. President Wilson of the Telephone, Telegraph & Cable Company says: "No official knowledge of the authorization of the purchase of the Erie Telephone Company to the Telephone, Telegraph & Cable Company of America exists." Erie stock has been steadily advancing in the market. The Telephone, Telegraph & Cable Company still holds 21,000 shares, and is by no means a small factor in the future of the Erie. Bell interests are suspected of an attempt to depress the stock, but if they sought to do this they have failed, hence the source of recent buying is more mysterious than ever.

An ordinance granting to James E. Bell, president of the Bell-Nelson Mill Company, his successors or assigns, the right, privilege and franchise to lay down, construct and maintain an underground telegraph and telephone system in Everett, Wash., was read for the first time at the last meeting of the city council. The life of the franchise is 50 years, and the ordinance stipulates that work shall begin on the proposed system within 90 days after the ordinance granting it shall have been passed, the construction to be under the supervision of the city engineer. The ordinance further stipulates that the prices charged for service shall be \$3 a month for a one party business line, \$2.50 a month for a two party business line, \$3 a month for a one-party residence line, and \$1.50 a month for a two-party residence line.

The Troy, N. Y., Telephone & Telegraph Company has lowered its rate to \$30 a year for a business place and private residence. This rate, which went into effect last week, is for a long-distance instrument, with metallic circuit. The equipment, the telephone people say, will be the best that can be procured. The new rate is the same that prevails in Albany. The company has given out an official statement in which it refers in subtle terms to the attitude of the city authorities on the question of underground wires.

Articles of incorporation of the Trans-Mississippi Telephone & Telegraph Company, with offices at Des Moines, Ia., and a capital of \$100,000, were signed last week. The officers are: President, J. W. Hill of Des Moines; vice-president, F. C. Hubbell of Des Moines; manager, A. T. Pearson of Iowa City; treasurer, M. McFarland of Des Moines. The object of the company is to furnish long-distance telephone trunk lines to connect the 200 independent telephone systems in Iowa. The first line will be constructed from Council Bluffs to Iowa City.

The affairs of the Manchester, N. H., Telephone Company, which were thought to be about ready for final settlement, are still unsettled and probably will be for some time to come. By order of Judge Wallace, in the Superior Court, the report of the commissioner appointed by the court to fix claims against the company's estate was re-committed to have additional facts found.

Private parties are building a telephone line from Tusculum to Russellville, Tenn., 20 miles south, which will give Nashville direct communication with Russellville in a few weeks.

The Cane Belt telephone line of Wharton, Tex., has been extended to the new pumping station, Garwood, which is the terminus of the spur lately built by that railroad.

The Western Union Telegraph Company plans to compete in Kansas City, Mo., with the telephone company.

GENERAL ELECTRICAL NEWS.

Lighting.

Adams, Minn.—H. E. Johnson will erect a new flour mill and electric light plant here.

Alma, Kan.—J. H. McMahan, owner of the telephone company, will install an electric light system here.

Chicopee, Mass.—Steps will soon be taken by Manager Stebbins of the electric light plant to get estimates and figures on the proposed improvements and addition to the plant.

Clifton, Tenn.—Mr. Mansfield of Bellbuckle will establish an electric light plant here.

Corning, N. Y.—The Corning Gas Company has sold its illuminating gas plant, and the Corning Light & Power Company, the city electric lighting plant, to a syndicate of Eastern capitalists, headed by Alden M. Young, of New York City. Both plants will be operated under the new management.

Decatur, Ill.—The Decatur Gas & Electric Company will begin at once to make extensive improvements in both gas and electric plants. About \$15,000 will be expended.

Gallatin, Tenn.—The Legislature has passed a bill authorizing the issuance of bonds for the construction of an electric light plant.

Gloster, Miss.—C. H. Jenks of St. Louis, Mo., will prepare preliminary plans for an electric light plant.

Grand Island, Neb.—The Grand Island Gas Company, of which H. G. Leavitt is president, has decided to erect an electric light plant here.

Greensburg, Pa.—A short time ago S. C. Knight, of Fort Wayne, Ind., was here making plans for the erection of an electrical plant to cost \$500,000. It is the intention of the company to light all of the town within a radius of 40 miles with electric lights.

Gridley, Ill.—The question of erecting an electric light plant is being agitated by the citizens of this place.

Helena, Mont.—An Eastern syndicate has completed arrangements to purchase the stocks and bonds of the local company owning the street car, electric light and gas plants here, at a price aggregating \$250,000.

Iuka, Miss.—The citizens have voted to issue \$10,000 in bonds to build an electric light plant.

Jamestown, N. D.—The Citizens' Electric Light & Power Company has been incorporated here with \$35,000 capital stock by D. B. Hannah, G. Lutz, O. L. Churchill, T. Pettigrew and others. The company contemplates the purchase of the Jamestown Electric Light Company's plant and will completely remodel and rebuild the same at an estimated cost of about \$15,000.

Jermyn, Pa.—The People's Electric Company of this city has been incorporated with \$5,000 capital stock.

Kendrick, Idaho.—C. T. Bowen, an Eastern capitalist, contemplates putting in an electric light plant here.

Lompoc, Cal.—This place is to have an electric light plant.

Lowell, Mich.—Lowell contemplates the expenditure of about \$5,000 in improvements to its electric light plant.

Merrimack, Wis.—The village board has voted to assist local capital in constructing an electric light plant. N. Farnsworth will be one of the leading stockholders.

Middleport, N. Y.—W. C. Johnson of Niagara Falls has been granted a franchise to operate an electric light plant in this place.

Mishawaka, Ind.—The Dodge Manufacturing Company is about to let a contract for the installation of an extensive electric lighting plant for that establishment.

Morrisville, N. Y.—William Earl has purchased the electric light plant here.

Philadelphia, Pa.—Plans and specifications have been received from Washington by Penrose A. Mc Clain, custodian of the postoffice, for the installation of a new electric plant. Bids must be filed before May 14. The work is to be completed by October.

Suffolk, Va.—Bids will be received until May 15 for the erection of an electric light plant. W. N. McAnge, chairman, can be addressed.

Red Lion, Pa.—The stockholders of the electric

light company are making arrangements to build a new electric light plant.

Rock Hill, S. C.—This city will hold an election to decide the issuance of \$95,000 of bonds for purchasing the electric light plant and waterworks of the Rock Hill Water, Light & Power Company.

Santa Fe, N. M.—About \$50,000 will be expended at once by the Water & Light Company. This sum will be used in extending the light wires, increasing the power of the plant, etc.

Sault Ste. Marie, Mich.—The Chandler-Dunbar Water Power Company and the Edison Sault Electric Company have made arrangements to enlarge their plant extensively, and the work will begin within two months.

Selma, Ala.—The electric light plant at this place was badly damaged by a recent storm.

Sydney, C. B.—A party of Boston capitalists has secured concessions from this town and Glace Bay, to furnish electric light and to operate electric tramways.

Woodbine, Ia.—Woodbine contemplates the issuance of \$10,000 in bonds to build an electric light plant.

York, Pa.—The Merchants' Electric, Light, Heat & Power Company has purchased a site for the erection of its proposed plant.

Street Railways.

Columbus, O.—The power plant of the Columbus, Buckeye Lake & Newark Traction Company will be established at Hebron near Buckeye Lake.

Dimondale, Mich.—The township board has granted a franchise through the village and township to the promoters of the Battle Creek & Lansing Electric Railway.

Evansville, Ind.—The Evansville Electric Railway Company has filed a notice with the Secretary of State of an increase of capital stock from \$50,000 to \$600,000.

Indianapolis, Ind.—O. P. Ensley, A. M. Glossbrenner, H. A. Mansfield and F. W. Roberts of this city are promoting an electric line as a part of the proposed system between here and Logansport.

Kokomo, Ind.—Business men of this place have organized an association for the purpose of promoting interurban electric lines to center here.

La Grange, Ind.—J. F. Shuman of Angola is one of the promoters and the secretary of the electric railway to be built from Angola to Goshen by way of Orland and this place.

Lorain, O.—The county commissioners have granted a 25 year franchise to the Sandusky & Interurban Electric Railway Company, to construct its line through Lorain County.

Louisville, Ky.—The Louisville & West Point Electric Railway Company has been incorporated for \$5,000 by W. J. Lewis, who is the president.

Middletown, Conn.—It is reported a trolley line will be built from this place to Meriden over the old Meriden and Cromwell road from Westfield, and over the Branch road to Westfield.

New Haven, Conn.—It was lately announced that the New York & New Haven Road would soon equip the Waterbury division of the New Haven system with electricity. The expense for machinery alone will be \$300,000.

Niagara Falls, N. Y.—The International Traction Company may extend its lines from here to Batavia.

Portland, Me.—Articles of association have been received by the railroad commissioners from the Portland & Brunswick Street Railway Company, which proposes to construct an electric road from the town of Brunswick through Freeport and Yarmouth, a distance of about 16 miles.

Pottstown, Pa.—The Reading, Birdsboro & Pottstown Electric Railway Company has been incorporated by R. J. Purcell, T. F. Durham and H. A. Deery.

Trenton, N. J.—Among the trolley line projects of the near future is a road from this city across the State to the upper coast seashore resorts. This is not a part of the Johnson scheme, but is said to be contemplated by the Camden & Trenton Railway Company.

Manufacturing.

Baltimore, Md.—The Patapsco Electric Manufacturing Company has been formed with a capital of \$100,000.

Chicago.—The B. & H. Storage Battery Company, with a capital of \$2,500, has been formed for the purpose of manufacturing storage batteries, etc. Fred W. Kraft, H. W. Paddock and L. Miller are the promoters.—The Reynolds Electric Company, capitalized at \$2,500, has been organized for the purpose of manufacturing electrical machinery, devices and supplies. Henry W. Prouty, Peter Anderson and Alvin L. McElroy are back of the enterprise.

New York City.—The Standard Meter Company has been formed to manufacture water meters and motors, with a capital of \$100,000. W. H. Marsh, J. S. Simmons and J. A. Young are interested in the enterprise.

Company Matters.

Chicago.—The Automatic Electrical Repair Company's Works was slightly damaged by a recent fire.

El Paso, Tex.—The International Light & Power Company filed an amendment to its charter increasing its capital stock from \$25,000 to \$50,000.

Hoosick Falls, N. Y.—The Hoosick Falls Electric Company has been sold to Worcester, Mass., parties. At a recent meeting of the new company the following officers were elected: President, L. A. Taylor; treasurer, William H. Hylee; secretary and assistant treasurer, Frank H. Viele, all of Worcester.

Martinsburg, W. Va.—Messrs. Shade and Hammond, have formed a partnership for the purpose of dealing in electric fixtures, doing wiring and any other work of a general electric kind.

New Haven, Conn.—The Brown Electrical Construction Company, of which C. Fred Brown is agent, filed a petition in bankruptcy at the office of Referee Newton last week. The schedules accompanying the petition show liabilities amounting to \$10,896.62, and assets of \$646.

Power and Transmission.

Cannon Ferry, Mont.—The Missouri River Power Company, that owns a dam and power plant here and is now constructing a pole line to Butte, will build another dam across the Missouri River at Stubbs Ferry, five miles below the present plant. The new dam and plant will cost \$1,000,000, and will develop 10,000 horse power, which, with part of the power now generated here, will be sent to Butte.

Mines.

Lake City, Col.—The Hidden Treasure Mine property is worked by water power through electricity and air. But the intention of the company is to do away with air altogether and substitute electricity. This power will be applied to drills in the tunnel first and if successful electric drills will be used all over the mine.

Automobiles.

Davenport, Ia.—The first electric automobile made its appearance on the streets of this city recently.

Kansas City, Mo.—The Day Automobile Company held its opening reception at its new quarters a short time ago.

Kingston, N. Y.—I. M. Block, J. W. Brewster of this place, and William F. Rafferty of Rondout, are the directors of the newly formed Kingston Automobile Fire Alarm Company, capitalized at \$30,000.

New York City.—The Adams-McMurtry Company, capitalized at \$10,000, has lately been organized to deal in automobiles. Messrs. George B. Adams, A. L. McMurtry and H. W. Pratt, all of this city, are the interested parties.

Philadelphia, Pa.—Plans for an electric vehicle line on Broad street are being prepared by Samuel A. Boyle, Jr., attorney, and the local president of the company using the Gilday motor vehicles.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by ELECTRICITY from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16½@16¾c.; Lake, 17@17½c.; casting, 16½@16¾c.

The dividend and interest disbursements in Boston May 1 foot up a total of \$5,111,615.

The annual meeting of the New England Telephone Company takes place in New York the first Monday in May.

The United Telephone and Telegraph Company has given a mortgage to the Equitable Trust Company of Philadelphia for \$2,000,000.

The Denver (Col.) City Tramway Company has declared a quarterly dividend of 1 per cent., payable May 16 to stock of record May 6.

The American District Telegraph Company has declared a dividend of 1 per cent., payable May 15. Books close May 6 and reopen May 15.

Directors of the Westinghouse Electric Company have declared the regular quarterly dividend of 1½ per cent., upon the assenting stock, payable May 15.

The Brooklyn Rapid Transit Railway Company reports for March: Gross earnings, \$955,504; operating expenses and taxes, \$714,044; net earnings, \$241,450.

The West Chicago Street Railway Company has declared the regular quarterly dividend of 1½ per cent., payable May 15. Books close May 4 and reopen May 16.

It is rumored that the capital stock of the Chicago Edison Company will be increased 15 per cent. some time this year and be offered to the stockholders at par.

The report of the Mexican Telephone Company for the year ended February 28 (dollars in Mexican currency) shows: Gross earnings, \$187,466; operating expenses, \$102,635; net earnings, \$84,831.

Plans have been completed for the consolidation of a number of traction lines in Northwestern Pennsylvania. The merger will result in the building of a through line between Erie, Pa., and Youngstown, O.

The San Francisco and San Mateo Electric Railway has been purchased by a syndicate composed of Baltimore, Md., men, for \$1,600,000. The road has a capital stock of \$1,000,000 and its gross earnings have been about \$225,000 a year.

Copper during the past week was quiet, but prices remained unchanged. The exports continue small. The London market, however, was weak, declining £1 in the last two days of the week, which is remarkable, when the exports from this country are so small.

C. D. Simpson, of New York, has bought at a foreclosure sale for \$50,000 the Cortland & Homer (N. Y.) Traction Company and the Cortland & Homer Electric Company. At this low price many of the smaller stockholders, unable to protect their holdings are wiped out, with ruinous loss.

The following are quotations for some of the industrial stocks not quoted elsewhere: Electrical Lead Reduction, 4¼@5; Electric Boat, 18@21; Electric Vehicle, 10@13; Tel. & Tel. Company of America (full paid) 6@6½; Electric Company of America, 9@9¼; National Carbon, 15¼@15½.

An official of the Boston Electric Light Company is reported as saying: "Judging from the present progress made in matters relative to a consolidation of the Boston and Edison electric light companies there is little prospect of a merger of the two companies before next July. In the meantime there will be another dividend declaration by our directors."

The Chicago Edison Company's report for the fiscal year ended March 30 will not be ready probably for two weeks. The annual meeting will be held June 10. Officials say that the net earnings have been gratifying in comparison with the preceding year, when a surplus after bond interest and dividends amounting to \$149,075 was carried forward.

A prominent financial interest says: "There has been some talk by interests in the American Railways Company and in the Electric Company of America about the advisability of forming a plan to combine both companies with one or more other companies. As yet this talk has not taken any definite form, and the question of terms, which would be proposed to stockholders if the plan went through has not been settled."

The latest electric railroad to be perfected is one from Dansville to Rochester, N. Y., down the Genesee Valley, and it will be known as the Rochester and Southern Traction Company. It will be 60 miles in length and is intended for freight and passenger business. The equipment will be made for handling heavy business and speed. To start with, the corporation will be capitalized at \$1,000,000. Satisfactory progress has already been made in securing right of way and franchises.

Advices from Philadelphia state that the surplus reported by the Electric Company of America at the close of 1899 was \$838,925, and profit and loss in 1900 gives balance brought forward as \$742,045. This difference, nearly \$100,000, is explained by officials of the company to be due to writing off for depreciation. At the present time the company is understood to have about \$500,000 more actual cash in hand than is shown by the statement, which is as of December 31, making the entire amount to date about \$900,000. This is due to the fact that the proceeds from the sale of the Camden plant do not figure in the December 31 statement.

The General Electric Company has declared the regular semi-annual dividend of \$3.50 a share on the preferred stock. This, says a dispatch from Boston, was probably done to enable the stockholders to participate in a final dividend prior to the exchange of the stock for common as provided for in the circular recently issued. The circular names August 1 as the date on which all stock to be exchanged must be deposited and the selection of the same date for the payment of the dividend is probably done to make a final payment upon the day the stock ceases to exist. The exchange of preferred stock for common will give stockholders of the former 8 per cent., instead of 7 per cent. now paid.

ELECTRICITY.

EDITORIAL NOTES.

Programme for the Niagara Falls Meeting.

Judging from the prelimin-
ary programme just issued
for the Twenty-Fourth con-
vention of the National
Electric Light Association,
the meeting at Niagara
Falls on May 21, 22 and 23 should be a most in-
structive and interesting one. Six papers will
be presented on the following subjects:

"Arc Lighting at the Beginning of the
Twentieth Century," "Storage Batteries in
Central Stations," "The Practical Side of the
Incandescent Lamp," "The Foresee (4-C) Sys-
tem of Charging," "A Station Load Diagram,"
"Distribution of Current at High Potential
in New York City."

Besides these papers food for thought will
be furnished by the Committees on Grounded
Circuits, Rules for Electrical Construction and
Operation, Standard Candle Power of Incan-
descent Lamps, Photometric Values of Arc
Lamps, Analysis of Flue Gases, The Legisla-
tion Regarding Theft of Current, Amendments
to By-Laws, Amendments to Freight Clas-
sification of Electrical Apparatus, Legislative
Policy, Uniform Accounting, and Steam Heat-
ing from Central Stations.

As the dedicatory ceremonies of the Pan-
American Exposition will be held May 20, dele-
gates to the Convention will be afforded an op-
portunity of witnessing the event.

* * *

Opening of the Pan-American Exposition.

The Pan-American Expo-
sition was opened on May
1, as scheduled, in spite of
the fact that some finish-
ing touches were needed
to complete the buildings
and make the grounds perfect. The pro-
gramme of the opening day was not extensive,
but included some very interesting features.
There was an address by Col. J. H. Brigham,
chairman of the Government Board, on the
opening of the Government Building, concerts
by two military bands, both in the afternoon
and evening, and a grand electrical illumina-
tion of all the buildings of the Exposition.
The regular opening exercises are to be held on
the 20th day of May at the same time as the
dedication exercises, and on this occasion
many interesting features will be introduced,
including processions, speeches by prominent
officials, etc.

The illuminating effects at the Pan-Amer-
ican Exposition probably surpass anything of a
similar nature heretofore attempted. The
electrical energy required to operate the
thousands of incandescent lamps and the
numerous searchlights as well as the many
pieces of electrical machinery is derived prin-
cipally from Niagara Falls, which is fast be-
coming known the world over for its vast re-
sources in available power for commercial pur-
poses. The Niagara Falls Power Company,
which has control of most all of the available
power, has now in operation ten turbines of
5,000 horse power each and has awarded a con-
tract for six more turbines of the same capac-
ity. This new machinery including the gen-
erators is expected to be in place by May 20,
ready to assist in the delivery of power to the
Exposition.

All of the lighting circuits are controlled
from the Electricity Building. The arc lights
about the outer edge of the grounds and else-
where are supplied from fifteen constant cur-
rent machines. For 110 volt direct current in-
candescent lighting two 100 kilowatt direct
current machines have been provided, together
with a 180 kilowatt, and a 600 kilowatt, sixty
cycle alternator. The 500 volt power circuit
is operated by four direct current machines of
a total capacity of 1,000 kilowatts.

All of the principal electrical manufacturers
have space either in the Transportation Build-
ing or in the Electricity Building, and when
all of the exhibits are properly arranged and
in working order, they will undoubtedly make
a very fine showing and favorably impress
visitors from the South American countries.

* * *

The Electrical Equipment of the Elevated Roads.

It now really seems as
though rapid transit, at
least so far as the elevated
railroads of this city are
concerned, is in sight. At
stated intervals during the
past several years rumors have been circulated
to the effect that the Manhattan Elevated
Railroad Company proposed to change its mo-
tive power from steam to electricity. These
reports served to buoy up the hopes of the
people for some time, but no definite steps
were taken until the erection of the power
station near the East River was begun about a
year ago.

Now it is announced that the Manhattan
Company has closed a contract with the Gen-
eral Electric Company for all the necessary

electrical traction apparatus for equipping its elevated lines. This contract involves electrical supplies and machinery worth approximately \$3,000,000, and is said to be the largest ever awarded to any electrical company.

With a view to adopting the best system or method of train control the Manhattan Elevated Railroad Company caused an experimental line to be built along its Second Avenue road from 65th to 94th street. On this stretch of track various experiments and tests were made, and it is therefore after mature deliberation, that the contract was awarded.

As will be recalled, about a year ago the Manhattan Company awarded the contract for the electrical equipment of its power house to the Westinghouse Company. The contract entered into last week is for the rolling stock equipment only, and it specifies that the motors and other apparatus shall be delivered within ninety days.

The Manhattan officials hope to operate the third-rail system before the summer passes; but granting time for all delays the officials declare positively that the whole elevated system will be operated by electricity before the end of summer or not later than the early fall.

The contract with the General Electric Company is for the complete electric equipment of the trains throughout the system. The contract specifies the multiple unit train control, with motors for 800 main cars and half that number of trailers. As each motor car will have two motors, there will be 1,600 motors for these cars alone.

It was said that the chief reason for the delay in equipping the Manhattan lines has been caused, not by the failure of the contractors, but because of the difficulty which the Westinghouse Company has encountered in obtaining a sufficiently large boring machine, which a Philadelphia concern has been engaged in making.

From the above it may be inferred that not later than this time next year, the power house will be completed, and the entire system will be electrically-equipped and free from dust, smoke and cinder-producing steam locomotives, which, needless to say, will be appreciated by the public.

* * *

Electricity for the Miami & Erie Canal.

There are a number of canals on the Continent of Europe on which the barges are towed by means of electric haulers running along the banks. From present indications it will not be very long before the principal canals on this side of the Atlantic will be operated in the same way, and as the horse gradually disappeared from in front of street cars, so will the mule become conspicuous by its absence from the tow rope of canal boats.

A number of Cleveland and Cincinnati capitalists are financing a company that proposes to propel canal boats by electricity from Toledo to Cincinnati. The name of the organization, which has a capital stock of \$3,000,000, is the Miami & Erie Canal Transportation Company.

It is the purpose of the new company to construct tracks along the towpath of the Miami & Erie Canal, on which small electric locomotives or haulers will be operated. The motors will take the place of mules for towing the canal boats. It is claimed that this method is much more economical than animal power. Under the old method each boat required a

crew of two or more persons, quarters for stabling at least two mules, and it was not possible to tow more than one boat at a time.

With the electric system it is expected that from one to six canal boats can be towed at the same time, while not more than two men will be required for the entire fleet, and if only one boat is to be towed, not more than one man will be required. The quarters now used for stabling purposes can be devoted to the storing of freight; thus the boats can be operated at a decreased cost, and at the same time carry more tonnage. With horse power it takes several days for a boat to go from Cincinnati to Toledo, but it is estimated that with electricity the trip can be made in less than twenty-four hours. The shallowness of the canal would prevent a higher rate of speed.

Referring to the plans of the company Mr. W. H. Lamprecht, the president, is reported as saying:

"We expect to have the system between Cincinnati and Dayton completed and in operation by September or October. The large shippers along the line of the proposed improvement are enthusiastic over the proposition, and if only one-half of the freight that has been promised to the company is ultimately handled by it, we will have even more business than we even expected. As soon as possible after the completion of the Cincinnati-Dayton line, the system will be extended to Toledo."

It is understood that the company has obtained the right through the Ohio Legislature to build the tracks along the towpath.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

MR. C. W. S. CRAWLEY brought before the London Institution of Electrical Engineers on April 18 a contribution entitled "Note on the Use of Differential Galvanometer," in which he endeavored to say a few words in favor of an old but very effective instrument, which has fallen into disuse, and to show a practical way of using it for modern work. Mr. Crawley does not suggest that the differential galvanometer should be used for ordinary accurate coil work, as the Carey Foster method is perfect for that. He has never sanctioned any accurate coils between 1 and 10,000 being finally tested by any other method; but below 1 ohm it is invaluable, and it makes quite easy a good deal of special work which would not be practical commercially by any other method.

MR. STEPHEN L. COLES, well known in electrical circles and who has been engaged in technical journalism for a number of years, has associated himself with Mr. M. J. Shaughnessy in a business which will consist in preparing and publishing technical and trade literature for firms in need of such services. Their offices will be located in Temple Court, 5 Beekman street, New York.

A LONDON dispatch says a strange fatality appears to surround the Yerkes Hampstead and Charing Cross underground line. One after another the lieutenants in charge of the undertaking have resigned for no apparent reason. First Mr. Lauderbach, who had been Mr. Yerkes' right hand man for years, discovered

that the London climate was unsuitable. Then Mr. Davis, who engineered the deal originally, suddenly severed his connection and returned to New York. Saturday Mr. Howard Abel, who was especially brought from Chicago to superintend the work, resigned too, but declined to make public his reason. He will await the arrival of Mr. Yerkes in London next month before returning to America. This leaves only Mr. Chapman, the engineer, to look after affairs.

FRANK D. HILL, the United States Consul at Amsterdam, informs the State Department at Washington, that H. R. der Mosch and H. Jul Joostenz, of Bavaria, Java, have been granted a thirty-year concession for the erection of electric light and power plants in the cities of Padang and Djokjakarta. Padang, says the consul, is the largest city of the west coast of Sumatra and has a population of about 35,000. Djokjakarta contains 85,500 people and may be reached by rail from Samarang.

It is stated that a San Jose, Cal., man is about to introduce a pacing machine in that city, which is to be driven by an electric current from an overhead trolley wire.

THE London "Engineer" states that several French syndicates have planned the development of the water power of the Rhone, and extensive plants are to be erected within the next three years between Pymont and the Swiss frontier. The first of these projects is that of Malpertuis, 2½ miles below Bellegarde, where the river falls 30 feet to 35 feet, with perpendicular banks only 160 feet apart. By building a tunnel 1.2 miles long, a total fall of 51 feet to 55 feet can be secured, equivalent to 25,000 hp. at low water. Near Bellegarde another tunnel would secure a fall of 80 feet to 85 feet, developing 30,000 hp., and about 8 miles from the Swiss frontier is a narrow gorge only 80 feet wide, and a dam built here would give a fall of 65 feet, or 30,000 hp. at low water.

At a recent meeting of the Commissioners of the Park Department in this city new rules for automobiles in Central Park were announced. Seven miles an hour is to be the maximum rate of speed hereafter for these machines, and when a horse comes in sight, going in the opposite direction, this rate must be reduced by one-half. Commissioner Clausen said that the object of the rule was to lessen the danger of runaways and accidents. The steam driven machine is the one particularly aimed at. The automobiles driven by electrical power have been in the parks so long that the average horse has become accustomed to them, but the steam driven vehicle, hissing and buzzing along, is trying on the nerves of the high strung animals.

SINCE the perfection of the Marconi telegraph a good deal has been written in the untechnical press as to inventions which have been made by numbers of experts for the steering of torpedoes, without providing any connecting wire between the torpedo and the ship which has dispatched it. We do not suggest that the inventors have not given thought to the question, says the "Electrical Engineer," London, but we do not think the public properly understand the real difficulties in the way. The difficulty is not so much in the

steering of the torpedo—which has already been done through a wire trailed behind the same, or paid out from the torpedo as it moves—as in knowing exactly where the torpedo is at any instant in order that the control may be varied to bring the same up to the desired target. When the distance between the torpedo boat and the torpedo exceeds a mile, a large marker on the torpedo projecting above the water-line is required to enable its whereabouts to be determined. Unfortunately, as the torpedo approaches the target, which in war time would be a ship, this marker would be more easily seen from this vessel than it would be from the torpedo boat which is steering the torpedo. The difficulties in the way of a successful solution of the problem are, therefore, exceedingly great, especially when one takes into consideration the action of currents, which varies with the tides. The sending of a signal to alter the position of the helm of a torpedo is an easy matter, but it does not follow that the difficulties in steering a torpedo on a desired course have been overcome in consequence.

The strike of the tramway employees in Barcelona, Spain, is becoming more serious. The strikers tried to tear up the tramway track but were driven off by gendarmes, who opened fire on the mob.

The Forty-five mine of the Monte Cristo district, tributary to Everett, Wash., is making some important changes in the method of operating its 36,600 foot tramway leading from the mine to Silverton, the point of shipment on the Monte Cristo Railroad. Hitherto the tramway has been operated by water power furnished by the Stillaguamish River, on the Silverton side of the mountain, over which the road passes, with only one bearing at the summit. The plan has proved a failure. In the changes now under way the tram will be operated from the Forty-five side of the mountain by an electric motor with eight bearings on the summit of the mountain instead of one as before, and it is conceded by practical engineers that the plan will succeed.

The State Department has received a communication from Horace N. Allen, the United States Minister to Korea, saying that an American firm has received the contract to construct a highway in that country 18 miles long to cost \$141,930, and for the extension along this road of the present electric street railway, to cost \$358,560, in connection with an electric lighting plant for the city of Seoul.

A GERMAN Imperial Commission has been carrying out experiments on the question of the consumption of coal dust in fire furnaces, and in the report which has recently been issued special mention is made of the Schwarzkopff apparatus. Some of the conditions peculiar to this arrangement are given in the "Journal" of the Society of Arts. In the first place it is stated that a highly heated fire chamber is necessary for the ignition of the coal dust, for the higher the temperature the quicker and more perfect will be the combustion. Contact with the boiler walls must be guarded against, as it interferes with ignition, and a fire chamber lined with fireproof material has also to be provided, because only such a chamber can be kept constantly at the required high temperature. It is pointed out that a fire chamber is

not an inconvenience, but rather a special advantage in coal dust firing, because it ensures a perfect combustion, a high temperature of the gases at the start, and protection against the formation of needle flames. Further, such a chamber offers for boiler firings in case of stoppage, the advantage that by the heat stored in the fireproof walls the steam pressure is longer maintained. The apparatus seems also to insure a smokeless combustion.

"LE PETIT BLEU" announces to the N. Y. "Herald" that King Leopold intends to create a network of electric railways, requiring a capital of a milliard of francs, to be constructed in the following order: Brussels to Antwerp, Brussels to Ostend and Brussels to Paris. According to the same authority the consent of the French Government has been secured.

According to a foreign contemporary there is a project on foot for the construction of a movable electric platform on the north side of the Seine in Paris. It will be underground, and its length will be about 6 miles. The route proposed passes under the Avenue de l'Opera, the boulevards, Boulevard Sebastopol, the Rue Turbigo and the Rue de Rivoli. The newscheme embraces four platforms instead of three, as was in use at the exhibition. The first platform will be stationary, the second will have a velocity of $1\frac{1}{2}$ meters a second, the third 3 meters, and the fourth 5 meters, or 16½ feet.

ELECTROLYSIS is used in the United States mint for the preparation of proof silver. Fine silver is subject to electrolytic action, using an electrolyte of silver-nitrate with 1 per cent. of free nitric acid. The bar of fine silver is closely wrapped in filter paper and again inclosed in cotton cloth, by which the impurities, such as peroxide of lead, etc., which accumulate as the bar is dissolved, are retained. The bar so protected is connected with the positive pole of the battery or other source of electricity, thus becoming the anode, while the cathode is formed by connecting a sheet of chemically pure silver to the negative pole. The silver is thrown down as crystals, which are easily washed. In this way pure silver, even in large quantities, can be easily prepared.

The Warkwitz process of metal plating has been talked about for some years, but particulars have so far hardly been available. According to a paper read by Sichelstiel, in the Nurnberg section of the Verein-Deutscher Ingenieure, it is a combined soldering and welding process. If plates of aluminum, says the "Engineering," London, which melts at 700 deg. C., and of copper, melting point about 1,100 deg. C., are placed upon one another and heated, the aluminum will unite with the copper. But it will form a hard, brittle alloy, rich in aluminum, which is of no use for binding a further layer of aluminum. At lower temperatures the two metals will not unite. Yet Warkwitz proceeds somewhat as described, but his aluminum sheet is exceedingly thin, forming, when pressed on hard, to avoid all oxidation of the copper, a copper alloy which contains very little of the other metal. This alloy welds under the rolls with other sheet aluminum, and thus the plating is accomplished. In the case of iron and steel the process is less simple; but, on the whole, the same method is applied for uniting any metals of widely differing melting points.

A WELSH electrician is said to have invented two X-ray tubes for which he claims several advantages over the ordinary tubes, especially that they are non-injurious, one of them actually tending to heal burns and wounds. One makes bones and not flesh visible on a photograph plate, while the other makes neither visible, the plate only showing foreign substances.

A COMBINATION of great magnitude among the telephone and telegraph companies in the United States is declared to be under consideration. The master minds in the enterprise are said to be President Mackey of the Commercial Cable and Postal Companies and Gov. W. Murray Crane, both of whom are among the largest stockholders in the American Telephone & Telegraph Company, the latter being one of the largest stockholders of the Western Union and, until he became Governor of Massachusetts, a director of the Western Union Company.

At the meeting of the executive committee of the International Association of Municipal Electricians held at Niagara Falls, N. Y., all arrangements were made for the annual convention of the organization to be held in that city this summer. The committee decided to hold the convention on September 2, 3 and 4. It will attract between 150 and 200 municipal electricians from all parts of the country.

The Metropolitan Street Railway Company of Kansas City and the Kansas City Electric Light Company recently let contracts for buildings and equipment amounting to \$1,500,000. The contract for the generators was let to the General Electric Company through its Chicago office; the contract for the boilers was secured by the Babcock & Wilcox Company.

A CABLE dispatch from London states that a Dr. Ludwig Mond has discovered a method of producing illuminating coal gas at two pence per thousand feet, which will effect a revolution by cheapening electric power.

The Board of Rapid Transit Commissioners at a meeting held last week decided to have the rapid transit trains enter the Bronx by means of a tunnel under the Harlem River, instead of on an elevated structure as was originally proposed.

The National Electric Light Association Convention.

The headquarters of the National Electric Light Association for the annual meeting to be held at Niagara Falls on May 21, 22 and 23, will be at the International Hotel, which has been entirely reserved for those attending the meeting. Rates, American plan, \$5 per day, with bath; \$4 per day without bath.

The respective Passenger Associations covering the territory east of the Mississippi River have granted a rate of a fare and one-third, on the certificate plan, for delegates and friends attending the Convention, from all points in their territory to Niagara Falls and return.

The dedicatory ceremonies of the Pan-American Exposition will be held on Monday, May 20, the day before the opening of the Convention, thus enabling members and delegates to attend within the time limit of their tickets.

"Electricity's" Educational Series.

BY R. MAX EATON.

ARTICLE NO. 26.

SUGGESTIONS FOR THE TELEPHONE INSPECTOR.

A branch of the electrical industry which represents quite a proportion of the army of electrical workers is telephone inspection.

As stated before in these articles, it is practically impossible for one individual to master all the branches of the industry in a practical way, although a superficial knowledge of the entire science may be acquired by a thorough theoretical education; however, the practical side of the science represents numerous separate and distinct trades, of which telephone inspection is one, and one which, I believe, on an average commands as high a rate of salaries as any of the other branches.

During a recent conversation with the head of an inspection department in one of our large cities I made the inquiry as to what peculiar qualities or characteristics were most essential for a successful inspector. He replied, that of course first of all was a thorough knowledge of the telephone work, but this by no means constituted the only features requisite to success, as besides being competent to repair the troubles in telephones, if any existed, the inspector was also supposed to smooth out the subscriber's ruffled temper and to create a genial feeling of the subscriber toward the company which, in all probability may have been temporarily ruffled by the aggravating annoyance of an inoperative telephone. Then to do this and maintain a satisfactory atmosphere of congenial feeling, the inspector must, besides having good telephone ability, be a close student of human nature, quick of perception, of good address and be able to adapt himself intellectually to any change of surroundings, whether his duty calls him to the inspection of a telephone in a fish market or in the private office of a railroad president. Understand that the nature of the inspector's errand requires that the subscriber's views of the trouble encountered be secured, as four times out of five no specific or definite trouble exists but the inspector is sent to satisfy the whim of the subscriber who may have been only accidentally "cut off" when using the instrument or have been talking to a long noisy line, which will naturally interfere with and lessen the efficiency of the instrument. The subscriber does not know this and naturally ascribes the trouble to defects in his instrument and immediately in his annoyed state of mind sends for the inspector. In a case of this kind do you see the situation of the inspector? He must hear the version of the trouble from the subscriber, listen attentively and seriously to his ideas of where the trouble exists and how to fix it and agree with him, while he upbraids the heartlessness and oppression of monopolies. The inspector upon examination of the instrument and general deduction from the situation may find that no actual trouble exists, yet this must not be made known to the subscriber, but rather the impression conveyed that the trouble has been located and cleared, leaving the circuit in an entirely satisfactory condition. Although in

a majority of imaginary troubles this remedy is generally satisfactory, yet it will not suffice in every case, and the inspector must decide this by his ability to study human nature.

You will wonder wherein all these requirements are essential to the repairing of a telephone. They are not essential to the repairing of an instrument but are necessary accomplishments to the inspector, who of necessity encounters all these conditions, and as a result it becomes a part of the trade and must be cultivated and added as an adjunct to the telephone knowledge, to fulfill the requirements expected by a company of its employees hired in that capacity.

The supervising inspector besides enumerating these special features, which are necessary, emphasized them by a recital of several instances as an illustration.

One instance was where an operator on a branch exchange complained of not being able to hear well and sent for the inspector. After careful examination the inspector found the apparatus working properly, but noted the fact that the operator was suffering from a slight cold, which to some extent dulls the hearing, and concluded at once that the defect was with the operator rather than with the apparatus.

The fact that some trouble existed was firmly established in the operator's imagination, and the remedy for this was to reverse the direction of the operator's imagination, which could not be done by stating that no trouble existed. "Well, I should say you have been having trouble. Look at this receiver; some one has turned the diaphragm upside down. It is no wonder you could not hear. Try it now and I will talk to you from a 'phone close by and you will see how well it will work." The inspector called the operator from a convenient 'phone and of course talked clearly and distinctly and the operator attributed it to the repaired receiver. The operator actually heard better over the lines after that because her imagination was set working in that direction. Any telephonist knows that it makes practically no difference which side of a diaphragm is up. The inspector in this case actually cleared a piece of trouble, which, however, was imaginary, but that is what the telephone inspector is doing one-half the time, clearing imaginary troubles.

Another case worthy of note, to show where in an inspector must use his "Sherlock Holmes" ability, was where a subscriber continually complained of a cut-out in his instrument, but the inspector could never find any trouble on the circuit. The subscriber was so positive in his assertion that trouble existed that the inspector made special inquiries and after using considerable ingenuity discovered that occasionally, a man with an impediment in his speech answered a 'phone which this subscriber often called. The fact that the man stuttered gave the impression that there was a "cut-out" on the line. This may appear to be the funny side of the telephone inspector's duties, but nevertheless this funny side exists and becomes a part of his trade.

HOW TO TEST FOR TROUBLE.

The first thing to do when inspecting an instrument or looking for existing trouble is to examine the receiver and see that it is in perfect working condition. Remove the diaphragm and clean the ends of the magnets. As all tests are made by and depend on the re-

ceiver many misleading impressions might be conveyed if it was not in good working condition.

To find if a "frying" or scraping which exists is caused by the transmitter cut it in and out of the circuit, while listening, by short circuiting it on the binding posts or some other convenient points.

A scratching sound caused by defective cords may be discovered by moving the cords while listening on the circuit.

To find out whether a "cut out" is on the line or in the instrument place a test receiver in series with the line and while listening with it cut the instrument in and out of the circuit by short circuiting it at the line binding posts. If the "cut-out" exists after the instrument is short-circuited then it must be on the line.

To find out whether a battery is run down or not, short circuit the line and judge by the amount of "side tone" received. An examination of the batteries is more reliable however.

To test for a leak on the battery circuit, connect the test receiver in series with it and note if any current is flowing when the automatic hook is down.

To test to find if a line is grounded or not, connect one side of the battery to ground and the other side through the test receiver to the line, make and break the circuit to see if any current is flowing; if there is then the line must be grounded to complete the circuit of the battery.

To test a noisy line to see if it is perfectly balanced and transposed listen with the test receiver between each side and ground. If there is a difference in the amount of noise on each side then the line is either unbalanced or not effectually transposed.

If a line is either open or short-circuited it may be tested by the magneto on a general system line, but if a common battery circuit it may be easily discovered by the fact that no current will reach the instrument.

Article No. 27 will be entitled "Difference of Ground Potential and Its Effects."

SWITCHBOARDS.*

BY T. D. BOYLES, E. E.

I wish to bring to your attention to-night a few points in regard to modern switchboard design, which effect the safety and reliability, and therefore, the success of modern methods of generating and distributing electrical energy. In a great many cases these points are overlooked by many engineers. I think you will all agree with me that switchboard design and station layout constitute one of the most intricate and important problems which confront electrical engineers.

It has been the custom in laying out stations of moderate size to bunch the conductors from the generators in one duct, or group, and to locate the switchboard and bus-bars in whatever space happens to be available. The feeder cables have usually been run in one well, so close together that a breakdown of one cable has been liable to effect several others. The switches that have been mounted on the switchboard have often not been capable of interrupting the circuits on overloads, and have been sometimes so located in respect to each other that the arc from one would be very

*Abstract of paper read before the Cleveland Electric Club April 3, 1901.

liable to spread and sometimes injure the entire board. The bus-bars have seldom been sufficiently insulated from other parts of the system, and very often a breakdown occurring on one small part has injured them to the extent of causing the entire station to shut down. It is the aim to-day to protect and isolate each part of the switchboard, switching devices, bus-bars and conductors, so as to give the least possible chance for a breakdown under the most severe emergency conditions. Furthermore, if such a breakdown should occur in one part, it would not in any condition spread to another part of the system.

Taking up first the conductors leading from the generating terminals to where they connect with the switching devices, those from each unit should be separated from those of another unit as completely as possible, and should be so protected that a breakdown in one can not involve those of another. This can be accomplished best by running all cables from one unit through a single duct, which may consist of an iron pipe suitably insulated, or a terra-cotta or other fireproof duct. These conductors should be connected to a switching device capable not only of opening the normal load of the generator, but of the short-circuit of the entire station. These switching devices should be so located that in event of failure of any one, it would not disable any other apparatus. In case of extremely large units, it is advisable to provide an extra factor of safety by placing two switches in series, so that in event of the failure of any one, the other will open the circuit. This is analogous to a duplicate system of steam pipes and piping. From the switching device to the bus-bars, the conductors should be protected as far as possible in the same manner as from the generators to the switches. The greatest care should be taken to the location and protection of the bus-bars, as this is the only part of the system where the entire energy is concentrated. Bus-bars should be thoroughly insulated and separated from each other and from other parts of the system, so that in case of a breakdown in any part of the system, it will not be disabled. On high-potential alternating current work, it is desirable to place each bus-bar in its own fireproof compartment, bringing conductors, which connect to it through suitable insulators in one of the walls. For convenience of inspection and repairs, the compartments should be provided with removable flameproof doors. The conductors from the bus-bar to the feeder switches should have the same protection as those from the generator switches to the bus-bars. The feeder switches should be of the same general type as the generator switches, and should be capable of opening under a maximum short-circuit of the entire system. The conductors for the outgoing feeder should be separated as much as possible and grouped in several wells. The number of these wells should be dependent upon the numbers of centers of distribution. There should be, at least, one well for each center of distribution.

The same general rules that apply to switching devices, bus-bars, etc., in the generating station should apply to the sub-stations or centers of distribution. The failure of any part in a single sub-station may cause that sub-station to shut down, but as this is only a single unit of the entire system, it will not have the same effect as a breakdown in any part of the generating station, which is liable to effect the entire system. In some cases it may be possible

to use less expensive switching devices for sub station work.

These problems, however, naturally have to be considered in each individual case. The foregoing may be regarded as axioms upon which all propositions may be developed.

I will now take up and describe, as far as possible, the different methods used to accomplish the desired ends: Starting first with alternating-current stations, of an average capacity of 4,000 kw. to 5,000 kw., operating at a potential of from 6,000 volts to 10,000 volts, three phase. Considering that the safety of the boiler plant, steam pipes, engine and generator units have been thoroughly provided for, we may start with the conductors.

The conductors from the generators should be carried in separate lines of conduit, suitably insulated, to the point where they join their generator switches. The generator switch should be made up of three single-pole elements, each element in its own fire and flameproof compartment. With this construction, if any one pole of a switch should fail, the other two would be capable of interrupting the circuit. Such a switch should, of course, operate as a triple-pole switch, and may or may not be automatic.

There are two styles of switches to-day which are capable of opening high-potential circuits of large magnitude successfully: one is an air type switch, which consists of hinged blades, when opened, the break must be sufficiently long to interrupt the arc. The different poles of this switch must be separated by suitable barriers. The objection to this type of a switch is that it allows the arc to occur in the open air in the station, and to insure safety to other parts of the system, it is necessary to devote to each switch a large amount of space, which, in the power station of to-day is very valuable. The other type of switch, which can be safely used, is the oil switch.

The following is a description of one type of this switch: For each pole there are two stationary contacts, each of which is mounted in an oil receptacle, the moving contact being a "U" shaped piece. This gives two short breaks in series, one break in each oil receptacle, each of the movable contacts being fastened to a cross-bar with insulating material. This cross-bar may be operated in several different manners, two of these methods being sufficiently interesting to warrant a description.

The first is by means of compressed air, the cross-bar being connected to the piston of the air cylinder. The valve admitting the air to the cylinder is controlled by a magnet, which receives its energy from some constant source of power. The only part of the switch which is mounted on the switchboard panels is the small controlling switch, which makes and breaks the connection to the controlling magnet. This is always of small current capacity, and operating at a low potential.

The second method is electrical operation. The cross-head in this case is connected through a crank by a special worm and gear to an electrical motor, this motor being controlled through an operating switch mounted on the switchboard panel similar to the one used for the pneumatically operated switch, the motor deriving its energy from some constant source.

The electrically operated switch has an advantage over the pneumatically operated switch, in that it is unnecessary to install air

compressors, reservoir and piping, which are a constant source of trouble, due to leakage. These oil switches should be mounted in the safest and most convenient position. This location should be such as to give the best and safest layout for the wiring. The conductors from the switches to the bus-bars should preferably be single conductor, rubber-insulated cables, sufficiently separated from each other.

The bus-bars in a plant of this size should be made of bare copper, mounted on porcelain or glass insulators, which will withstand a puncture test of several times the working voltage. Each bar should be mounted in its own compartment. These compartments can be made of soapstone and brick, or any suitable material, and space should be left for a passageway on each side.

The feeder switches should be exactly the same type as the generator switches, except that their ampere capacity will commonly be less. They must be capable of opening the circuit under any condition of load. The feeder switches should be automatic in their operation: that is, they should open automatically on overloads, and it is sometimes desirable to put a time limit attachment on this overload device, so that any short circuit or ground which may occur will have time to burn itself out before the circuit is open. This is especially of advantage in overhead lines which may be accidentally crossed by telephone or telegraph wires.

The greatest amount of care and attention should be given to the station wiring, and the location of the switching device, bus-bars, etc., should be such as to give the safest and most reliable construction. There should be as few crosses as possible, and where such crosses occur, the conductors should be separated by suitable barriers, or a sufficient distance.

Coming now to the operating and instrumental panels: each generator should have connected to it one main ammeter, one main voltmeter, one recording wattmeter, one power factor indicator, one synchronizing device, one field rheostat, one field switch, with discharge resistance, and one operating mechanism for main switch.

The principal point in regard to alternating-current instruments, next to accuracy, is the dead-beat quality. A recording wattmeter on each generator panel is preferable to a single wattmeter in the main bus, as in the first case, the wattmeter is operating nearer its rated load, and therefore with greater accuracy, while, in the second case, as the average load of the station is usually small, as compared to its total capacity, the wattmeter is operating under very poor conditions.

The field rheostat for large generators should preferably be operated by remote control. This can be accomplished in several ways: For example, by mounting the hand wheel on the panel, and the rheostat, where convenient, and connecting the two by a system of beveled gears, or sprocket wheels, and chains: or by mounting the hand wheel on a pedestal placed in front of the switchboard, and connected to the rheostat in the same manner as above; or again, by means of a motor mounted on the rheostat and governed by a controller mounted on the panel. This latter method is preferable, where current in the fields of the generator is of such magnitude that there will be considerable saving of copper by mounting the field rheostat very close to the machine.

The synchronizing device consists of a sys-

tem of connections with potential transformers and a suitable visual indicator. It is usually arranged so as to synchronize between the generators themselves, instead of between the generator and bus-bars, as this is usually the simplest way, especially in the cases where the bus-bar is divided into sections. The synchronizing may be done either by an incandescent lamp connected so as to burn brightly when in synchronism, or by a voltmeter.

The field switch should be of the carbon-break type, so arranged that, at the instant of breaking, a discharge resistance is connected across the field terminals to take up the inductive discharge.

Each outgoing alternating-current feeder panel should have mounted on it three ammeters, the overhead relay and the operating switch for the main switch. The three ammeters are used to show any unbalancing of the three-phase system.

I do not wish to omit speaking of the exciter switchboard in connection with an alternating-current generating station. This board should be so arranged and the location such that it is always convenient to the operator.

Coming now to the switchboards in the sub-stations. As previously stated, the precautions in regard to the safety should be the same as those in the generating stations. There will be slight modifications in regard to

In case of arc service, it has been found advisable to design a special switch, which is of the plug tube type, the arc being ruptured in a long insulated tube. This switch is very satisfactory for small currents upon which it is used, but it would not be recommended for large currents.

One important part of switchboard work which is very often neglected is the use of recording wattmeters. It is of great importance to the station superintendent to have a record of the total watt-hour consumption of power in the various kinds of service of his system. There should be one recording wattmeter on each generator, and one recording wattmeter on each outgoing feeder. In sub-stations of centers of distribution, one wattmeter can be used on each generating unit, and one on each outgoing feeder. It may be advisable in some cases to omit those on the outgoing feeders in the sub-stations.

ELECTRO-MAGNETIC COILS AND PLUNGERS.*

BY RANKIN KENNEDY.

This simple combination, so much used in electrical appliances, has not so far as the author can ascertain, been treated by anyone applying the modern views of magnetism to cre-

$$F = CB \times .00000685.$$

Where r is maximum drag on conductor in pounds per foot of length,
 B = induction in C.G.S. lines per square cm., cutting through the conductors.

In a common arc lamp solenoid B may, and often does, reach a value of 625; calculated by the above formula, this induction would give 0.04 lb. per foot of wire cut in the coil carrying 10 amperes.

A reference to Fig. 1, however, will show that no more than half the coils of wire can be cut by the field when one-half of the coil is filled by the plunger.

Let us consider different cases. Fig. 1 is a case where coil and plunger are equal in length, and we have just glanced at its magnetic condition when the plunger end is half way down the coil. In this position the distribution of the magnetic field is such as shown; one half of the flux cuts one-half of the coil at right angles to the axis, and there can be found a point along the axis of the plunger where the flux is at a maximum in the plunger. This is an important point; it is shown at a b in Fig. 1. It is a little bit below the center of the plunger, so that when half the plunger is in the coil a few of the lines of the field will re-enter, cutting the coil in the reverse direction.

FIG. 1.

FIG. 2.

FIG. 3.

FIG. 4.

details, especially dependent upon the kind of service for which the power is to be used.

The equipment of instruments and other devices on the switchboard for a system will depend upon whether motor generator sets or rotary converters are used. In either case, there should be the same type of switch on the alternating-circuit end as is furnished on the feeders, and it should be capable of opening the circuit under a severe short-circuit.

In the case of the sub-stations being used for direct-current lighting work, the switchboard and switching apparatus will be practically the same as in railway practice, until we come to the direct-current end, and at present, on three-wire direct-current work, each individual case requires its own solution, and it is very hard to lay down any general rules.

If the sub-station is to be used for alternating-current lighting, power is generally distributed by means of step-down transformers, and will be distributed for either incandescent or arc lighting. For incandescent lighting there will be the usual equipment of instruments, and, in the majority of cases, an alternating-current regulator for boosting or lowering the voltage on each individual feeder, so as to keep a constant potential at the lamp terminals. This regulator should be so arranged as to be controlled from the switchboard.

to. Perhaps nothing better is to be found on the subject than Chapter VIII. in the book of Prof. Silvanus Thompson, "The 'Electromagnet,'" but it does not go further than calculating the intensity of magnetic force at any point on the axis of a long solenoid, and some speculative views as to what happens with permanent magnet plungers, long plungers and short plungers, all very interesting from the point of view of the author.

Perhaps the coil and plunger can be best treated as an electro-motor, which indeed it is, even in its most elementary form. Referring to Fig. 1, the coil carries a current of 10 amperes, which acts on the core, producing a magnetic field as shown by the dotted curves. It is evident that the wires or conductors cut the field precisely as do they in a motor, hence the field magnet (the core or plunger) will be drawn in or the coil drawn up, the action and reaction being opposite and equal.

As the plunger of straight bar form is about the worst form of field magnet, even for a simple solenoid, it is difficult to calculate the total flux cutting the coils; but given this total flux or induction, the number of turns cut across, and the current, we can arrive at once at the pull in pounds on the plunger.

The pull on a conductor in the magnetic field of a motor is equal to

*From the "Electrical Review," London.

As the core, or plunger, goes down into the coil, this re-entering of the lines in the reverse direction increases until, when the plunger has reached the far end, as many lines cut the coil going out of one end of the plunger as cut it going in at the other end, so that there can be no pull one way or the other, both fields being equal. This is the case of Fig. 2. The coil lies in two equal and opposite fields of

FIG. 5.

FIG. 6.

magnetic force or lines at right angles to its axis; it is this field at right angles to the axis of the coil which we must deal with in all solenoidal reactions; not the field parallel to the axis.

If the plunger is longer than the coil, it will arrive at a position of equilibrium, with ends

protruding equally, as in Fig. 3. The two fields of force are acting equally on the coil, and if the core is pulled steadily out we will get more and more of the one field removed from it, until a point is reached where the action of the other field is a maximum.

With a straight bar plunger and coil the field is complicated by leakage, the large air-gap allowing the lines to bend round and re-

FIG. 7.

enter the core. But if we could measure the induction through the plunger at the point *a b*, Fig. 4, just at the mouth of the coil, we should find this induction a maximum when the pull on the plunger is a maximum. When the pull on the plunger is nil, i.e., when it is in the coil in equilibrium, the line *a b*, i.e., the section of the plunger through which the induction is a maximum, coincides with the middle of the coil, as in Fig. 3. As the plunger is still further pulled out its magnetism falls, and line *a b*, recedes.

In treating of irregular cones and tubes used as plungers, this law that the sectional line of the plunger, where the induction arrives at a maximum, coincides with the middle of the coil, decides the position of the plunger when it comes into equilibrium.

FIG. 8.

Now let us consider a better field magnet for the coil. Let the core be long and bent into a horse-shoe. It is of little practical use considering the position of a core end above the middle of a coil. Fig. 5 shows a coil and horse-shoe plunger. In this case we have the lines of force conducted round the yoke and flowing in one direction only through the sides of the coil; we have done away with one of the fields, and the pull goes on rapidly increasing until the core projects a little beyond the lower end. In some arc lamps each leg of the horse-shoe enters a separate coil.

The induction in the case of a horse-shoe plunger comes within more easily calculable limits. We have, say, for its maximum position, number of turns of wire in the coil $\times$ by amperes flowing $= N C$, and we have the sectional area and length of plungers, also approximate area and length of air-gap, from which we can arrive approximately at the value of the induction in the air-gap. This induction known, the pull can be calculated by the formula already given.

Still, a plain horse-shoe of round or flat iron produces a straggling ill-defined field of force. The polar surfaces are small, but it is a great improvement on the straight bar, where a great pull over a fairly long range is required, with small waste of energy.

Considered from these points of view, the best form of plunger and coil should be designed to make the coil wide and thin, and to use soft iron tubes inside and outside; in fact, a scientific construction of the horse-shoe type of plunger.

Here, in Fig. 6, is a section of a coil, with an inner and outer soft iron tube, connected by a circular yoke, the outer tube forming a mantle over the coil.

We are now coming nearer to a series-wound motor. The wires in the air-gap at *g* are the armature conductors, those above the air-gap the field winding; it is not necessary for me to show how easily the pull on this plunger can be calculated for any position. It may be pointed out that by making the tubes thin

rection of the current in the coil. In Lord Kelvin's recording instruments this coil and plunger is used; it has also been used in an arc lamp.

A very powerful coil and plunger, a modification of the foregoing one, was applied by the author to a machine for striking a heavy blow; it is sketched in Fig. 8. The coil is ironclad, and has two ring-shaped inner poles, *N*, *S*, and a plunger to loosely fit the bore. This plunger has cut into it a series of grooves in which the armature winding is wound, to produce a pole in the middle and one at each end; the length of the core is equal to the length of the ironclad coil plus the length of the stroke. This is a most powerful solenoid and core, or coil and plunger, and may yet be of considerable use in mechanism.

A long solenoid with two long horse-shoe permanent magnets can be used for an equable pull over a considerable range; but permanent magnets are not really permanent when acted upon for any length of time by solenoids.

ENGLISH ELECTRIC MINING MACHINERY.

BY FRANK C. PERKINS.

It may be of interest to note some of the recent types of English mining machinery as installed by the firm of Ernest Scott & Mountain, Ltd., of Newcastle-on-Tyne. The work that has to be done underground in mines and collieries, for which mechanical power is re-

FIG. 1.—ELECTRIC EXCAVATOR USED AT GREAT CENTRAL RAILWAY, LONDON.

enough above their polar faces, they can be saturated magnetically so that the pull will be proportional to the current. This is the beginning of the higher development of the coil and plunger.

If, now, we divide the coil into two coils, one an armature, and the other a field coil, we shall be able to pull the plunger up or down by reversing the current in either half.

A further development arrives at a coil and plunger of the shunt motor type, Fig. 7, a main coil forming the armature and a fine wire shunt coil forming the field winding, together with an outer and inner tube with polar faces.

Here we have a constant field, and the plunger may be driven up or down according to the direction of the currents in the coils.

Another modification of the coil and plunger, which is designed to give a long range of equal pull or push of small force, consists of a long solenoid with a still longer plunger. The plunger carries a magnetizing coil wound in two sections, producing a pole in the middle. The sectional area of the plunger and the power of the magnetizing coil must be so designed that the plunger is magnetically saturated by its own coil. A current in the long solenoid outside will pull with a long equal range, either up or down, according to the di-

quired, consists chiefly of excavating, hauling, pumping, drilling and coal cutting, and for all of these purposes electricity is perfectly adapted to be the motive power. It is essential, however, that all such machinery should be strongly made, to stand the more or less rough usage to which it is sure to be subjected under such unfavorable conditions.

The excavating for the Great Central Railway, London, is an example of the economical and convenient methods in modern construction utilizing electrically operated machinery. The illustration, Fig. 1, shows an electrically operated excavator used in this work, and was designed and built by this firm for use with the Greathead Shield, now extensively used in England and elsewhere in deep tunneling. The materials for construction were carried to the work and the waste excavated matter hauled away by the Scott-Mountain electric locomotive, shown in Fig. 2. These locomotives are equipped with 25 hp. electric motors and are extensively used in mining and contractors' work.

In electric mining pumping two-throw and three-throw ram pumps are extensively used, as the chief condition of success is that the work to be done shall be as steady and continuous as possible, and to secure this the three-throw

pump has been very widely adapted, as giving a constant stream of water, and therefore requiring an even turning moment. In removing water from mines the centrifugal pump direct connected to an electric motor is also found very useful, and is largely used in contractors' work, the sets being mounted on a bogie and lowered to the exact spot where they are required, following the level of the water as it is pumped away. A duplex centrifugal pump will deliver to about 150 feet, while a triplex pump will operate to 200 feet and when four pumps are connected in series will work against 300 feet head.

An electrically driven hydraulic pump of more than passing interest is that shown in the illustration, Fig. 3. It was designed and constructed by Scott & Mountain and is driven direct from an electric motor by means of worm gearing. The most efficient arrangement for electric pumping machinery is by connecting the motor direct to a pump as with centrifugal pumps, or by connecting the motor and driven machine by belt or ropes, but in underground work the latter is often out of the question, on account of the damp atmosphere in which the plant has to work. The two other alternatives are spur or worm gearing, both being positive in their action, and

FIG. 2.

Electric Locomotive used in building the Great Central Railway, London.

thus open to the objection that any sudden shock to the driven machine is transmitted direct to the motor, which of course is not the case with belt driven, where a sudden overload causes the belt to slip. A combination of spur gear and belt is sometimes arranged, and works very well for either pumping or haulage. There is considerable loss in a worm gear, but if the worm wheel is machine cut, and the worm runs in a bath of oil, this can be reduced to a minimum and there is no doubt that where space is limited this gear makes a very satisfactory arrangement for reducing the speed of the motor.

In reference to the relative efficiency of electrical power transmission for mining work and other methods, the above mentioned English manufacturers take the following losses for their apparatus, in a plant of say 100 hp., or over:

Loss in dynamo, between horse power on pulley and output at terminals, 7 to 12 per cent.; loss in motor, between watts at terminals and horse power on pulley, 7 to 12 per

There is no gold mine without its full share of unprofitable dirt. There is no course of instruction without its full quota of dry and almost meaningless pages; and there is no

FIG. 3.—SCOTT & MOUNTAIN'S ELECTRICALLY-DRIVEN HYDRAULIC PUMP WITH WORM GEAR.

cent.: loss in cable, 5 per cent., per 100 yards, single run, at 500 volts pressure. The estimate in the instance of generator and motor at 200 yards including the depth of the mining shaft, gives the following results:

Brake horse power on dynamo pulley..	100
Electrical horse power at dynamo....	90
Electrical horse power at motor (loss	
= 4 x 5 per cent. = 2 per cent.)....	88
Brake horse power on motor pulley....	79

or a total efficiency of 79 per cent., which will compare very favorably with any other method of transmission.

It Pays to Read the Trade Papers.

To keep in touch with all the interests of one's business, to know at all times the status of the industry of which one's business is a fraction, to be informed as to wants of buyers and as to the goods of sellers, and to have a knowledge of one's competitors' progress, those are the guide-boards to success of the most elaborate nature. No hermit ever accomplished great deeds. No narrow gauged business man ever became a leader in trade.

Some tradesmen urge the excuse that much that appears in trade journals is neither important nor pertinent, and that their time is so limited and their duties so exacting that they haven't the spare hour in which to read trade publications.

Let us grant, for the sake of argument, the unimportant and irrelevant plea, and ask whether it is better to miss the knowledge of important and pertinent matters because this is so, or to secure the benefits to be obtained from important and pertinent items, even at the expense of reading, in search for the useful, something that isn't so all-important?

road to success without its more than essential rocky steeps and thorny fringe. Just so, there is no trade journal that is all instruction and all rich advice. Were it so, trade journals would sell at a guinea a copy, and trade journal advertising space would be as costly per square inch as £100 bank-notes. Were it so, trade journal editors would rank as twentieth century Solomons, and trade journal publishers would be as unapproachable as the Czar of all the Russians.

As for the item of time, the excuse is no excuse. If you haven't time you should take time, just as you take time for every other business demand. And don't dodge duty by delegating to a clerk the reading of the trade journal. The head of affairs may delegate much labor to assistants, but he cannot delegate brains to any one, and it is brains that count. No two men place the same estimate on the value of any idea, suggestion, or item of news. A paragraph that is trivial to Brown may be a gold mine to Smith and vice versa. And so, if the head of affairs desires to keep in touch with his industry he can ill afford to trust to a clerk's idea of the worth of this or that idea in a trade publication, but instead must read and weigh for himself.—Exchange.

Telephones that Suit the War Department.

The following letter speaks highly for the Ericsson Telephone Company's instruments:

War Department, Signal Office,
Washington, Feb. 26, 1901.

Ericsson Telephone Co., 296 Broadway, New York.

Dear Sirs: Referring to the order this day placed with you for 200 bridging telephones, this office desires to state that, as you are probably aware, in the early part of 1900 we shipped a lot of telephones of six different makes to Manila

for test purposes. The report upon the Ericsson telephone has been favorable. As the telephones covered by the present order are going to Manila, you should understand that it is expected that they will be in every respect of the very highest class of workmanship, in every detail, and it is believed that your company will readily see that it is to your own advantage to turn out the very best instrument possible. The telephones when ready will be subjected to a very careful and thorough inspection.

By direction of the Chief Signal Officer.

Very respectfully.

EUGENE O. FECHET,
Captain and Signal Officer, U. S. V., Disbursing Officer.

LEGAL NOTES.

Judgment for \$17,041 was entered in New York Saturday against the Newburg Electric Railway Company of Newburg, in favor of W. B. Mackay, Jr., on two demand notes of the com-

inventions in connection with the overhead trolley. His health failed in New York in 1894, and he had since resided in Denver.

AN INTERLOCKING MECHANICALLY OPERATED DRAWBRIDGE GATE.

BY H. G. TYRRELL, C. E.
Boston, Mass.

The frequency with which serious accidents occur at open drawbridges has prompted the writer to design a mechanically operated gate which he believes to furnish an absolute safeguard against disasters of this sort in all but extraordinary cases. The essential idea of this design is that the bridge and the gate cannot be open at the same time. The first cost of these gates is, of course, high in com-

at the same time gives the operator a few seconds leeway in shutting off his power from the gate motor. Power is supplied by a General Electric 3 hp. inclosed motor, shown in the lower right hand corner of the drawing, and this receives its current from wires on the draw span, through contact plates. When the gates are closed and the draw span is swung open, the electric connection is broken and the gates cannot be moved, hence the gates are controlled entirely by the operator on the draw span. The service of one man only is required on the bridge at any one time.

A bridge equipped with these gates can be opened and closed very quickly, since no time is lost in walking to and from the gates, as in the case of wooden gates operated by hand. The gates are always locked in every position,

AN INTERLOCKING MECHANICALLY-OPERATED
GATE FOR DRAW-BRIDGES.

H. G. Tyrrell, Newton, Mass. Designer.

pany made on November 16, 1898, and April 17, 1899. The summons was served on the president, Silas B. Dutcher, of Brooklyn.

An involuntary petition in bankruptcy has been filed against the Bruckner Electric Company of 141 East 25th street, New York, by creditors. It was alleged that the company is insolvent and permitted Sigmund S. Hershman to obtain a preference by judgment for over \$2,000, on which the sheriff levied upon the assets of the company, and has advertised the sale. It was also alleged that the company had transferred accounts to creditors.

John C. Henry Dead.

John C. Henry, a prominent electrical expert, died Saturday last at his home in Denver, Col., aged 53 years. He perfected many

parisons with the first cost of the ordinary style of hand-operated wooden gates, but they dispense entirely with the services of a gate-man, and for this reason will prove more economical in the long run.

The accompanying drawings show a pair of gates applied to a bridge with approach spans at either end, and having a 26 ft. roadway and no sidewalks. The design can, however, be modified to suit any width of bridge, either with or without sidewalks. As will be seen the gates are keyed to vertical shafts, which are shown turning in boxes fastened to the web posts of the fixed span. At the foot of these shafts are toothed segments worked by worms, which lock the gates in any position. These worms turn in oil baths, as shown. The worm shaft is connected by a system of reducing gears with the motor. In this system of gears is included a half-gear, which insures a movement of 90° only to the gates and

either open or closed. As an extra precaution they may be placed say 100 feet from the draw span. Then, should a car or train break through them, it would certainly come to a standstill before reaching open water. As a further precaution a derailing switch may be placed inside the gates, then in case of a car breaking through the gate, it would be thrown from the track and stopped, rather than pitching over the end of bridge. This switch may be operated by the gate motor through a series of wheels and levers.

At all times of both day and night the roadway should be well lighted and the gates themselves painted white so that they may be more easily seen. Danger lights should be located on the gates, showing white when open and red when closed. It is desirable to have these located sufficiently high above the floor that they may be plainly seen above a crowd. An estimate, based on the accompanying plan,

and including both ends of the bridge, is as follows:

Weight of gates.....	2,100 lbs.
" " machinery.....	5,600 "
" " machinery support...	5,200 "
	12,900 lbs.
12,900 lbs at 5 cents.....	\$645.00
Two motors, 3 hp.....	300.00
Total cost.....	\$945.00

Exports of Electrical Material from New York.

The following are the exports of electrical material, from the port of New York, for the week ended April 25:

Aberdeen, 3 packages, \$300; 13 cases, \$2,021; Antwerp, 96 packages, \$7,965; Argentine Republic, 2 packages, \$66; Australia, 292 packages, \$21,603; 52 cases, \$2,053; Berlin, 1 case, \$199; Brazil, 216 packages, \$14,141; British East Indies, 15 cases, \$500; 6 packages, \$945; British Guiana, 1 package, \$13; British Possessions in Africa, 95 packages, \$7,059; British West Indies, 11 packages, \$136; Brussels, 2 packages, \$184; Central America, 22 cases, \$663; 92 packages, \$3,632; Copenhagen, 10 cases, \$462; Cuba, 43 cases, \$1,379; 10 packages, \$555; Dutch West Indies, 2 packages, \$32; Florence, 27 packages, \$5,065; Genoa, 1 package, \$145; Gibraltar, 13 packages, \$750; Gijon, 2 cases, \$81; Glasgow, 67 packages, \$9,541; 11 cases, \$130; Havre, 38 packages, \$2,630; Hayti, 1 case, \$40; Lisbon, 2 cases, \$14; 1 case telephone material, \$66; 3 coils cable, \$2,890; Liverpool, 324 packages, \$101,805; London, 265 packages, \$16,374; 1 case motor vehicles, \$148; Manchester, 1 package, \$30; 229 cases, \$27,645; 19 packages motor vehicle parts, \$2,200; Marseilles, 27 cases, \$904; Mexico, 65 cases, \$6,159; 9 reels cable, \$3,803; Milan, 6 cases, \$3,000; New Castle, 6 cases, \$500; New Zealand, 65 packages, \$4,422; Peru, \$267 cases, \$19,105; Preston, 2 cases, \$100; Southampton, 1 case motor vehicles, \$25; 16 packages, \$1,062; Tasmania, 39 packages, \$1,120; U. S. Colombia, 33 cases, \$415; Venezuela, 52 packages, \$790; Vienna, 4 packages, \$343.

The following are the exports of electrical material, from the port of New York, for the week ended May 2:

Aberdeen, 27 cases, \$350; Antwerp, 16 packages, \$645; Argentine Republic, 175 cases, \$6,224; 16 packages, \$1,632; Australia, 2 cases, \$145; 2 packages, \$15; Bergen, 1 case, \$15; Birkenhead, 159 packages motor trucks, \$3,475; Brazil, 245 packages, \$16,807; Bremen, 21 packages, \$665; British Guiana, 23 packages, \$530; British Possessions in Africa, 3 cases, \$255; 1 case motor vehicles, \$1,725; British East Indies, 2 cases, \$232; British West Indies, 45 packages, \$1,265; Central America, 70 cases, \$932; Chili, 4 cases, \$484; Christianity, 1 case, \$150; Cuba, 218 cases, \$2,177; Dutch East Indies, 1 case, \$95; Ecuador, 15 cases, \$293; Genoa, 70 packages, \$5,066; Glasgow, 31 cases, \$5,041; 8 electric launches, \$6,400; 38 reels cable, \$11,659; Hamburg, 78 packages, \$9,460; 1 auto vehicle and parts, \$200; Havre, 19 packages, \$911; 236 cases, \$30,323; Hayti, 1 case, \$60; Hull, 55 packages, \$2,750; Libau, 3 cases, \$500; Liverpool, 175 packages, \$19,253; London, 625 packages, \$35,224; Madrid, 11 cases, \$900; Manchester, 18 packages motor trucks, \$2,400; Marseilles, 1 case, 40; Mexico, 166 packages, \$2,191; Middlesborough, 2 cases, 139; Milan, 7 cases, \$280; Naples, 1 case, \$5; Newcastle, 1

case, \$24; 12 packages, \$3,900; New Foundland, 5 packages, \$174; Nova Scotia, 8 cases, \$1,125; 2 bags, \$11; Peru, 14 packages, \$903; Port Said, 2 packages, \$26; Portsmouth, 1 case, \$300; Preston, 15 packages, \$525; Santo Domingo, 28 packages, \$554; Sheffield, 1 case, \$111; Southampton, 15 packages, \$1,230; 1 case, \$313; Stockton, 10 cases motor trucks, \$1,220; U. S. Colombia, 30 cases, \$1,218; Venezuela, 8 packages, \$161; Vienna, 3 cases, \$366.

PERSONAL MENTION.

Mr. Louis Glass of San Francisco, Cal., has been appointed general manager of the Pacific States Telephone & Telegraph Company.

INCORPORATIONS.

The New Electric Company, Niles, O. Capital stock, \$25,000.

The General Engineering Company, Brooklyn, N. Y.—to construct, maintain and operate gas and electric works. Capital stock, \$250,000.

The Carthage Electric Light & Power Company, Carthage, N. Y. Capital stock, \$75,000. Directors: J. E. Strickland and P. J. Corcoran, Carthage; T. B. Basselin, Croghan.

The Lake Placid Electric Light Company, Lake Placid, N. Y. Capital stock, \$10,000. Directors: Melville Dewey, Annie Dewey and Asa O. Gallup of New York City.

The Century Electric Company, San Francisco, Cal. Capital stock, \$40,000. Directors: L. D. Heltzer, S. H. Weidenthal, W. J. Nixon, F. H. Bates and W. D. Mackey.

The National Electric Improvement Company, Jersey City, N. J. Capital stock, \$2,000. Incorporators: Stephen C. Smith, Le Grand Bouker, Jersey City.

The M. K. C. Electrical Separator Company, Denver, Col.—to operate in Arapahoe County. Capital stock, \$100,000. Incorporators: F. H. Kirby, J. M. McClave, F. R. Cumbe and William Colley.

The Collins Electric Company, St. Louis, Mo. Capital stock, \$100,000. Incorporators: William F. Kempner, Ulysses L. Collins, F. William Grundman and William S. Cowan.

The Essex Electric Company, Trenton, N. J. Capital stock, \$700,000. Incorporators: W. Campbell Clark, Franklin Conklin, Henry Dickson, Bernard Strauss, Jacob Hausling, Richard C. Jenkinson, Julius H. Lebkuecher, Simon Scheuer, Robert H. McCarter, Moses Straus and J. Broadhead Woolsey.

The American Light Company, Philadelphia, Pa.—to manufacture and buy and sell all kinds of machines for distributing gas and electricity. Capital stock, \$5,000,000. Incorporators: J. Emory Bryan, M. C. Reed and A. D. Phillips of Philadelphia.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED APRIL 30, 1901.

ELECTRIC RAILWAYS AND APPLIANCES.

673,176. Clamp for Trolley Wires. James W. Perry, Philadelphia, Pa., assignor to H. W. Johns Manufacturing Company of New Jersey. Filed March 28, 1901.

673,186. Means for Retracting Trolleys. Thomas J. White, St. Louis, Mo. Filed Dec. 28, 1900.

673,209. Brake. Frank J. Jüngemann, Detroit, Mich. Filed July 18, 1900.

673,319. Double-Relay Crossing-Signal. Bert N. Parrish, Jackson, Mich. Filed June 30, 1900.

673,286. Electromechanical Emergency-Brake for Trams. Emanuel von Planta, Lucerne, Switzerland, assignor to the Gesellschaft für Patentverwertung der Elektro-Mechanischen Notbremse (System Planta), Basle, Switzerland. Filed Jan. 10, 1901.

673,368. Trolley-Stand. Frank Pfent, Conners Creek, Mich., assignor of one-half to Gilbert M. Moran, Detroit, and Louis A. Moran, Grosse Point, Mich. Filed June 27, 1900.

ELECTRIC LIGHTS AND APPLIANCES.

673,999. Anchor for Electric-Lamp Glowers. Marshall W. Hanks, Pittsburg, Pa., assignor to George Westinghouse, same place. Filed June 16, 1899.

673,106. Electric-Arc Lamp. Samuel H. Anderson, Pasadena, Cal. Filed May 23, 1900.

673,191. Device for Attaching or Detaching Electric Lamps. David H. Arthur, Philadelphia, Pa. Filed Dec. 27, 1897.

673,277. Incandescent Electric Lamp. Jules E. de Marcay, Paris, France. Filed Nov. 8, 1898.

ELECTRICAL MACHINERY AND APPARATUS.

672,950. Electric Motor. Frank A. Merrick and Joseph D. Forrer, Johnstown, Pa., assignors to the Lorain Steel Company of Pennsylvania. Filed Aug. 16, 1900.

672,951-672,952. Electric Railway-Motor. Frank A. Merrick, Johnstown, Pa., assignor to the Lorain Steel Company of Pennsylvania. Filed Aug. 21, 1900.

672,989. Transformer. Harry Shoemaker, Philadelphia, Pa., assignor of one-half to Gustave P. Gehring, same place. Filed Feb. 12, 1901.

672,992. Controller for Electric Motors. Emmett W. Stull, Johnstown, Pa., assignor to the Lorain Steel Company of Pennsylvania. Original application filed June 8, 1900. Divided and this application filed July 25, 1900.

673,085. Safety-Synchronizer for Coupling into Parallel Alternating-Current Machines. John Pearson, St. Paul, Minn. Filed Feb. 19, 1901.

673,108. Rheostat. Arthur W. Beresford, Westfield, N. J. Filed June 12, 1900.

673,274. Electric-Circuit Controller. Harry W. Leonard, New York City. Filed March 27, 1899.

673,317. Automatic Reverse Cut-Out for Electric Traveling and Hoisting Cranes. Jacob S. Cole and George F. Swartz, Homestead, Pa. Filed Aug. 14, 1900.

673,372. Voltage Regulator. Phil S. Tirrill, Groveton, N. H., assignor of one-half to Charles E. Bellows, same place. Filed June 27, 1900.

TELEPHONES AND TELEPHONE APPARATUS.

672,942. System of Automatic Telephone-Exchange. Alexander E. Keith, John Erickson and Charles J. Erickson, Chicago, Ill., assignors, by means assignments, to the Automatic Telephone Exchange Company, Limited, Baltimore, Md. Filed June 23, 1897.

672,947. Telephone-Exchange Mechanism. Harlan P. Snow, Erie, Pa., assignor of one-half to Frederick C. Jarecki, same place. Filed Sept. 28, 1899.

672,999. Telephone System and Apparatus Therefor. Arthur T. M. Thomson, East Dulwich, Eng. Filed Oct. 9, 1899.

673,072. Telephone-Meter. Donald M. Bliss, Lowell, Mass., assignor to the Automatic Telephone Meter Company, Orange, N. J. Filed Oct. 1, 1900.

673,311. Telephone Appliance. Myer London, McKeesport, Pa. Filed Oct. 31, 1900.

673,344. Telephone Switch and Cut-Out. Peter J. Wendell, Ophelm, Ill. Filed April 18, 1900.

673,350. Telephone-Transmitter. Charlton E. Yocom, New York City, assignor of one-half to James G. McFadyen, Pittsburg, Pa. Filed Feb. 4, 1901.

MISCELLANEOUS.

672,913. Electrolytic Current Rectifier and Condenser. Charles Pollak, Frankfurt-on-the-Main, Germany. Filed March 7, 1899.

672,936. Control of Electric Motors. Frank W. Garret, Johnstown, Pa., assignor to the Lorain Steel Company, of Pennsylvania. Filed Aug. 28, 1900.

672,959. Electrical Connector. Harry E. Norris, Northeast, Pa. Filed July 20, 1900.

673,020. Electric Pendulum Clock. Frederick Haenichen and Otto A. Haenichen, Paterson, N. J. Filed Jan. 10, 1901.

673,169. Electric Elevator. Nils O. Lindstrom, New York City, assignor to Alonzo B. See and Walter H. Tyler, same place. Filed Feb. 4, 1901.

673,172. Magnetic Separator. Robert McKnight, New York City. Filed March 15, 1900.

673,222. Storage Battery. Arvid Reuterdaahl, Providence, R. I., assignor to Reuterdaahl Electric Company, Saco, Me. Filed Aug. 9, 1900.

673,288. Electric Signal. Hiram M. Buck and John H. Love, Baltimore, Md. Filed June 11, 1900.

673,289. Regulation and Control of Electric Motors. James Burke, New York City, assignor, by means assignments, to H. Ward Leonard, same place. Filed March 22, 1898.

673,249. Base for Battery Cells. George T. Eyanon and Albert J. Shinn, Philadelphia, Pa., assignors to Herman J. Dercum, trustee, same place. Filed Dec. 4, 1900.

673,266. Booster-Regulating System for Storage-Battery Circuits. Albert S. Hubbard, Belleville, N. J., assignor to the Gould Storage Battery Company, New York City. Filed March 2, 1901.

673,287. Storage Battery. Arvid Reuterdaahl, Providence, R. I. Filed Oct. 10, 1900.

673,289. Supporting-Frame for Relay-Magnets. Ulysses G. Rogers, New York City. Filed Feb. 28, 1901.

673,315. Printing Telegraph. George A. Cardwell, New York City, assignor to Joseph Heimerdinger, trustee, same place. Filed Nov. 18, 1899. Renewed Nov. 14, 1900.

673,345. Regulation of Dynamo-Electrical Machinery. Schuyler S. Wheeler, New York City, assignor to Harry Ward Leonard, East Orange, N. J. Filed Sept. 24, 1894.

673,348. Electrical Distribution. Joseph L. Woodbridge, Philadelphia, Pa., assignor to the Electric Storage Battery Company, same place. Filed March 13, 1901.

DESIGN.

34,451. Trolley-Harp. Fredrick Sarbach, Westpark, O. Filed April 1, 1901. Term of patent 14 years.

THE TELEPHONE WORLD.

Detroit to Have a Model Exchange

The People's Telephone Company of Detroit, Mich., has let contracts for the construction of its telephone exchange system and contemplates the erection and equipment of the largest single multiple switchboard and central office equipment ever installed in the United States. This contract was awarded to the Stromberg-Carlson Telephone Manufacturing Company of Chicago after a thorough investigation of the various apparatus manufactured.

The initial switchboard equipment calls for a switchboard to have a capacity for 14,400 subscribers' lines of the multiple lamp line signal central energy type, equipped for the immediate operation of 6,000 subscribers' lines, with complete power, battery and ringing equipment in duplicate, with a capacity sufficient for the complete operation of the full ultimate capacity of the switchboard, and 6,000 telephones.

Manager J. B. Ware considers the Stromberg-Carlson system the best on the market to-day, and it is said that the bid of this company was the highest received by the People's Company; that superiority determined the award.

The Stromberg-Carlson system is already in use in Rochester, N. Y., St. Paul and Minneapolis, Minn.; Boston, Mass.; Youngstown and Akron, O.; Camden, N. J.; Duluth, Minn.; Waco and San Antonio, Tex.; Lexington, Ky.; Wheeling, W. Va., and a great many other smaller cities in the United States.

"We placed our order just in time," said Mr. Ware, "to get in ahead of Philadelphia and other Eastern and Southern cities where new telephone companies are figuring with the Stromberg-Carlson people. In fact, we hurried our order to be sure of having our work done first."

The installation date specified in the contract is February 1, 1902.

The People's Telephone Company, after a careful search for adequate headquarters, decided that it could only obtain what it wished by buying a site and erecting an exchange building, and accordingly purchased a lot 80 x 90 feet located on the southwest corner of Park and Elizabeth streets. The company's engineers have figured out that this site is within 200 feet of the telephone center of the city. The building will be six stories in height, modern in construction and especially designed for use as a telephone exchange. The building is favorably situated so that it will receive light from the north and east sides and afford excellent opportunities of bringing the very large and complex conduit system into the building without conflict with the existing conduit systems of other companies. The engineering problem for the installation of such a large system has been very creditably worked out by its consulting engineer, Mr. M. Reber, of Cleveland, O., who has had a great deal of experience in the construction and operation of some of the largest exchanges in the United States.

The underground material will be supplied by the Standard Underground Cable Company of Pittsburgh, one of the two largest houses in the United States dealing in this line of material. The contract was made at a certain price per foot, the material to be delivered as called for. The work of underground construction will be commenced at once.

The contracts for other materials have not yet been awarded, "but these can be obtained in the market at almost any time," says Mr. Ware, "the chief idea being to get contracts placed on the work that requires time. It has fully been determined that only copper wire shall be used, making the entire Detroit system one of metallic circuit."

"We recognize that business demands make the question of service the vital and final one in the telephone field, and especially is this true in Detroit, inasmuch as there had been one independent telephone exchange here which, owing to various causes, did not adequately meet the requirements," said Mr. Ware, "and this is the one point we have in view in constructing this system. The People's Telephone Company's Detroit exchange will be the model exchange of the United States. It is to accomplish this that it has decided upon the Stromberg-Carlson switchboard and telephones, to install an all copper wire service and to concentrate all our lines in one big exchange building. In this concentration of lines alone we shall be able to save time for our subscribers and largely increase the efficiency of the service. We do not believe at all in the branch station system. The Stromberg-Carlson Telephone Manufacturing Company will endeavor to make this Detroit exchange the model exchange of the United States for the reason that the city of Detroit is central and has many visitors and will be a show room for them, so to speak. Everything about the construction will be permanent and with a view to the accommodation in the not distant future of the entire 14,400 subscribers' lines, for which the exchange is being built and designed to accommodate."

Plans of a telephone line from Baker City, Ore., to the Panhandle are under consideration.

Messrs. Stone & Webster's report on Erie Telephone properties, says a large part of the construction has been done in the past two or three years, and the lines as a whole are comparatively new. The underground system is in use in business sections in all of the larger cities. About 40 per cent. of the total subscribers are served through underground cable, which contains 48 per cent. of the total exchange wire mileage. The average amount of wire mileage underground in the Bell system is 52 per cent. Considering the Erie Company has only six cities of the 32 in the United States with a population of 75,000 or more, the proportion of underground wire is very satisfactory. The Erie companies own and occupy 51 buildings and 14 parcels of land. The cost to reproduce property, exclusive of cost of franchises and rights of way, is placed at \$26,300,000.

As a result of the franchise granted the Northwestern Telephone Company by the Vermillion, S. D., city council Superintendent Christy has ordered numerous improvements to be made. New poles will be placed in position, all old 'phones will be replaced by new ones, two new switchboards, one for toll and the other for the local exchange, will be added. Twelve hundred feet of new cable has reached Vermillion, and the work of remodeling has started. Over 100 'phones are now in use in Vermillion.

The stockholders of the Spottsylvania, Va., Telephone Company, after declaring a dividend of 25 per cent. on the stock decided to extend the line to Belmont and Chilesburg in that State. At Belmont connection will be had with the Louisa line, affording communication with Richmond, Charlottesville and other cities.

The company which contemplates the construction of a telephone line from Tampa to Jacksonville, Fla., will commence operations very soon. The route has been laid out, and much of the right of way and certain franchises secured. The Orlando system will act as a feeder and lines will be built to the principal points near that city.

R. E. McWilliams is busy putting in a telephone system that will connect Canton Bend and Rock West with Camden, Ala., and it is not improbable that in the near future he will extend his lines to more distant points in Wilcox County. This new enterprise will prove a great convenience both to Camden and the surrounding towns.

The Kanton, O., Telephone Company is extending its lines all over the eastern part of Hardin County. A number of the farmers have had telephone service for the past few months, and on account of the satisfaction given, the county will be a network of rural lines before the close of the year.

Warren and Youngstown, O., capitalists, who now own the independent telephone system at Seattle, Wash., will organize a company with \$500,000 capital to buy the independent system at Portland, Ore. The same company owns the Birmingham, Ala., plant.

F. C. Pasak is to have charge of the installation of the plant of the Automatic Telephone Company in Seattle, Wash. Mr. Pasak says that by June 27, 360 telephones will be in operation. Underground cables will be laid throughout the business part of that city.

The Citizens' Telephone Company of Harriman, Tenn., has changed its name to the Tennessee Telephone Company. The charter has been secured and the capital stock placed at \$10,000. Aggressive steps are being taken to perfect the system and get ready for service at an early day.

J. W. Barwick and other representatives of the Peninsular Telephone Company have been granted a franchise by the Palmetto, Fla., city council. They agree to complete a long distance telephone line to Tampa by October 15.

The Commercial Telephone Company is preparing to make further extensions of its line to Jersey Shore, Pa. It also expects to get into Beech Creek shortly.

The State of Texas has granted a charter to A. M. Beville, J. M. Clower, J. D. Stacking and R. W. Talley to establish and operate a telephone system in Clarendon.

There is some talk of running a local telephone line from Marengo, Ill., north about two miles, thence west of the river road some four miles to the "seven bridges."

It is proposed to connect Monticello and White Lake, N.Y., by telephone. Already the necessary subscribers have been secured and operations will be commenced immediately.

S. P. Sheerin, of the New Long Distance Company of Indianapolis, says: "Telephones and telephone service are spreading over Indiana as rapidly as workmen can erect the plants. Within the last six years telephones in Indiana have increased from 12,000 to 66,000. The development of the independent companies and their friendly co-operation have been the most remarkable in modern history, and this development and the investment of large sums of money have been accomplished in spite of strong opposition and legal complications. The barbed-wire farm service has given way to substantial lines, and good service among the farmers is about as common as in the cities. Our line is now connected with nearly 30,000 telephones, and by reason of contracts with other independent companies we are connected with upward of 50,000 telephones. The future is full of promise, and henceforth the battle will be an even contest."

The committee on banking and commerce of the Dominion Senate has reported the bill increasing the capital stock of the Bell Telephone Company from \$5,000,000 to \$10,000,000. The company has thus won out against all opposition. The proposal to restrict the rates the company may charge to such rates as were in existence in 1892, when the company got its original increase of capital stock, and the proposal also of making the company liable for any over-charges since that time, were rejected. The company, however, accepted part of the amendment compelling it to furnish telephones upon application from persons living adjacent to the telephone system. The company was ordered to produce a list of its shareholders before the bill was further proceeded with.

On May 3 the State Board of Taxation rendered a compromise judgment in the case of the appeal of the New York & New Jersey Telephone Company from the assessment placed on its properties in Newark, N. J., by the local tax board. The company had been assessed \$350,000 on its personal holdings and \$160,000 on its buildings. By an agreement with City Attorney Boggs the company had agreed to abandon its appeal providing the personal assessment was reduced \$50,000.

The Mount Calm, Tex., city council has granted a franchise for the erection of a local telephone exchange and it will be put in as soon as the material can be secured. It will be operated by Mr. McFarlane, proprietor of the telephone system at Hubbard.

J. W. Morton, Secretary of State, recently issued a charter to the People's Telephone Company of Stewart County, Tenn. The capital stock is \$3,000, and the incorporators are: W. T. Thomas, R. G. McFall, W. B. Scott, C. C. Lewis, W. O. Edwards, George Stacker and R. E. Thomas.

The system of the Central Telephone Company, which has headquarters in Des Moines, Ia., has been sold to Indiana men for \$19,000. It is understood that from \$20,000 to \$25,000 will be expended at once in improvements.

TELEPHONE INCORPORATIONS.

The Henry County Home Telephone Company, Columbus, O. Capital stock, \$50,000.

The Ava Mutual Telephone Company, Avon, Ill. Capital stock, \$1,500. Incorporators: George E. McFarland, A. Sundberg and G. S. Osborn.

The Milo & Bradford Telephone Company, Milo, Ill. Capital stock, \$5,000. Incorporators: John McClane, Leroy H. Reed and Harmon S. Pettigrew.

The Independent Telephone Construction Company, Chicago. Capital stock, \$2,500. Incorporators: James P. Harold, W. E. Caylor and others.

The Southern Central Telephone Company, Trenton, N. J. Capital stock, \$10,000,000. Incorporators: John W. Avery, Osborn Congleton and Horace E. C. Thompson of New York.

The Spencerville Telephone Company, Spencerville, O. Capital stock, \$20,000. Incorporators: Albert C. Buss, Henry M. Ashton, S. L. Ashton, Ira B. Post and Philip Zimmerman.

The Walnut Hill Telephone Company, Walnut Hill, Ark. Capital stock, \$2,500. Officers: J. F. McKnight, president; S. Hacker, vice-president; D. D. Hamiter, secretary and treasurer.

The Charlottesville Rural Telephone Company, Charlottesville, Ind. Capital stock, \$200. Directors: Robert S. N. Oldham, Daniel Pearson, David Bundy, James McClarnon and others.

The Albany Home Telephone Company, Albany, N. Y.—to operate a telephone system in Albany and Rensselaer Counties. Capital stock, \$750,000. Directors: Samuel B. Rawson, F. H. Sudro, T. M. Brush, F. W. Martin, I. H. Griswold, A. E. Lord, of Elyria, O.; G. O. Lee, Jr., Howard Hendrickson and W. H. Keller of Albany.

GENERAL ELECTRICAL NEWS.

Lighting.

Bangor, Me.—Hon. J. P. Bass of this city has purchased the plant of the Oldtown Electric Light Company and will enlarge it this spring.

Benwood, W. Va.—The Wheeling Steel & Iron Company will install an electric light and power plant.

Berryville, Ark.—The Berryville Milling Company will in the near future install an electric light plant.

Caldwell, N. Y.—In a short time the streets of this place will be lighted by electricity.

Chatham, N. J.—A special election for the purpose of voting on the bonding of this borough for \$15,000 to establish an electric light plant will be held on May 14.

Clarksdale, Miss.—This city has decided to build an electric lighting plant. J. A. Omberg of Memphis, Tenn., has prepared the plans and specifications, and bids will be called for. W. Barry is chairman of the committee.

Dayton, O.—A bond issue to the amount of \$500,000 will be made soon by the Dayton Electric Light Company to provide for improvements to its plant.

Elgin, Tex.—This place will soon have electric lights; Messrs. J. M. M. Millan and S. H. Spangle, two capitalists of Taylor, have been investigating the matter.

Estherville, Ia.—Arrangements have been completed by the city for the enlargement and improvement of its electric light plant.

Geneva, O.—The citizens will vote on the question of issuing \$25,000 in bonds for the purpose of installing an electric light plant with municipal ownership.

Grant City, Ia.—This city is to have an electric light plant.

Holgate, O.—The city council is discussing the electric light question.

Hyalman, Pa.—This place is to have a new electric light plant.

Kenton, O.—The plant of the Kenton Gas & Electric Company has been sold to Samuel R. Bullock of New York. The company is capitalized at \$200,000, and has a five-year contract to light the city with electricity.

Laurel, Del.—Philadelphia and Wilmington capitalists have leased ground of Dr. Wolfe at this place, and will erect an electric light plant at once for the purpose of lighting Laurel, Seaford and other towns.

Lawrenceburg, Ind.—Bids will soon be advertised for the erection of an electric light plant in this place.

Lewes, Del.—The citizens of this place have voted to bond the town in order to establish an electric light plant.

Lisbon, Me.—The people here are agitating the question of establishing an electric street lighting plant.

Livermore, Pa.—Messrs. Smith & Miller of Johnstown have in view the operation of an electric light plant here in connection with the mill they purchased recently.

Manchester, Mich.—Manchester is dissatisfied with the present lighting service, and the village may purchase and enlarge the present plant when the franchise runs out.

Manning, S. C.—Dr. A. Becker contemplates the erection of an electric light plant here.

Middleville, Mich.—A stock company has been formed to operate an electric plant at Labarge, which will furnish power for this place and other towns in Barry County, some of which have already granted the company franchises to string its wires.

Monroe, La.—The Ouachita Cotton Mills will contract for an electric lighting plant.

Monroeville, Ind.—The Monroeville Electric Light Company was lately incorporated for \$10,000 by C. F. Manship, T. Noble and J. M. Tryon.

New Bloomfield, Pa.—This place is negotiating for an electric lighting and heating plant.

New Hartford, N. Y.—The Utica Electric Light & Power Company will install an electric light plant here.

Orrick, Mo.—The citizens of this place are talking of erecting an electric light plant.

Park River, N. D.—The citizens of this place will vote on the question of bonding for a municipal electric light plant and waterworks.

Sebewaing, Mich.—An electric lighting plant will soon be erected here.

Starke, Fla.—This city will issue \$13,000 of bonds for the erection of an electric light plant.

St. Michael's Md.—A number of business men have organized a company for the purpose of manufacturing ice here during the summer. A strong effort is also being made to establish an electric light plant, the same machinery to operate both the ice and electric light plant.

Summitville, Ind.—This place will soon have an electric light plant.

Troy, N. Y.—Messrs. Cordial, Hart and Moulton have been appointed a special committee to consider the expense and advisability of establishing a county electric lighting plant.

Tullahoma, Tenn.—This city has named F. B. Martin, W. M. Ross and E. L. Davis commissioners to provide for the erection of a municipal electric light plant.

Street Railways.

Bristol, Tenn.—The Belt Line Railway, which operates a power plant is taking steps to add electric light dynamos to its plant.

Chicago.—A company has been incorporated in Illinois to build an electric railroad from here to St. Joseph, Mich., a distance of 90 miles. This road will traverse the Michigan fruit belt and it will be the longest electric line in the West. Its estimated cost is \$2,000,000. The incorporators are H. T. Clark and J. T. Barhoff, of Cleveland, and W. F. Lesser of St. Joseph, Mich.

Cleveland, O.—The Cleveland, Painesville & Ashtabula Railway Company, which will build an electric line from Painesville to Meadville will be incorporated with \$1,000,000 capital stock.

Cornwall, Ont.—The Cornwall Electric Street Railway Company has purchased the property of the Cornwall Milling Company, which includes a large water-power, that it will use for operating its line.

Des Moines, Ia.—A special election will be held in Winterset May 21 to vote on the proposition to grant a franchise to H. H. Polk of this city for an interurban electric line between Winterset and Des Moines.

Hornellsville, N. Y.—Capitalists of this place are talking of constructing a trolley line from here to Bath, thence to Lake Keuka.

Indianapolis, Ind.—The Indianapolis & Martinsville Electric Railway Company was lately incorporated with \$600,000 capital stock and will begin the construction of an electric road from here to Martinsville, 30 miles distant. Chas. F. Smith is at the head of the company.

La Grange, Mich.—The township of LaGrange, Cass County, has granted a franchise to the Van Cleave electric road which is expected to run to Benton Harbor.

Macedon, N. Y.—The Macedon Electric Railway Company, capitalized at \$30,000, has been incorporated by Charles A. Lux, Clyde; S. P. Nichols, Palmyra and E. B. Norris,odus.

Monroe, Mich.—The Monroe Traction Company of this city has been incorporated with \$10,000 capital stock.

Mount Joy, Pa.—A charter has been granted by the State department for a trolley line from Lancaster to this place. The authorized capital stock is \$300,000.

Oklahoma, Okla.—The Oklahoma Street Railway Light, Power & Improvement Company was lately incorporated with C. F. Colord president, C. F. Gilpin, secretary. The charter gives the company a right to build lines to Guthrie, Elreno and other places in the territory.

Paulsboro, N. J.—It is stated that the Frick-Morse steel syndicate that is to build a plant here has become interested in the Paulsboro Traction Company, and will furnish a good part of the capital necessary to build the road.

Providence, R. I.—It is announced that electricity will soon permanently replace steam as a motive power on the Consolidated Railroad's branch line be-

tween this city and Bristol, 14 miles, and Providence and Fall River, 19 miles.

Saco, Me.—The Saco Valley Electric Railway Company has been organized with \$250,000 capital stock. The proposed road will run from here to Buxton and thence to Standish, a distance of 20 miles.

Troy, N. Y.—The Troy, Rensselaer & Pittsfield Railroad Company was recently incorporated with a capital of \$350,000 to operate a high speed electric road 35 miles long, in Rensselaer and Columbia Counties to terminate in this city and Rensselaer and at the boundary line between New York and Massachusetts in the town of New Lebanon. The directors are Edward F. Murray, Rice E. Ball, James W. Donnelly, Cornelius V. Collins, William H. Draper, Anthony P. Finder and Joseph C. Behan of Troy, William D. Barnes of Brainard and Matthew A. Heeran of Rensselaer.

Warren, O.—The Ohio River & Youngstown Railway Company has been incorporated for \$10,000. The company is authorized to build an electric railway through Mahoning and Columbiana Counties.

Youngstown, O.—Messrs. J. Stambaugh, S. L. Jackson and other Youngstown capitalists are organizing a company, with \$500,000 capital stock, for the purpose of furnishing this city with another electric street railway.

Manufacturing.

Ft. Wayne, Ind.—The plant of the bankrupt Belden Larwell Electric & Manufacturing Company was sold at public auction recently to the Fort Wayne Smelting & Refining Company for the sum of \$14,300.

Company Matters.

Chicago.—The Harvard Electric Company of this city has increased its capital stock from \$2,500 to \$10,000.

York, Pa.—The Arrowsmith Electric Company, Limited, whose headquarters are at Reading, has opened a branch supply house in this city. The firm will engage in contracting for electrical equipment of all kinds, sell supplies, novelties and staple articles connected with the utilization of current.

Power and Transmission.

Manitou, Col.—The Pike's Peak Power Company will shortly begin work on a big electrical power plant near Lake Moraine, on Pike's Peak. This plant is designed to furnish current for this place, Cripple Creek and Gillet.

Peach Bottom, Pa.—An electric plant is to be established here by the Susquehanna Electric Light & Power Company, recently organized with a capital of \$12,000,000. The plant will be operated by water power, and it is proposed to harness the Susquehanna River for this purpose. Electricity will be transmitted to Baltimore, a distance of 40 miles.

Potsdam, N. Y.—The Hannawa Falls Water Power Company is making arrangements to supply this village with electricity.

Vancouver, B. C.—The Stave Lake Power Company has recently acquired a franchise from this city, giving it the right for 50 years to do business as a power company within the corporate limits of Vancouver. The engineer of the company reports that 17,000 hp. can be developed at the Falls, and that this amount of power can be duplicated at another point lower down on the stream.

Automobiles.

Cincinnati, O.—The Auto Construction Company has been organized here with a capital of \$10,000. Samuel Newman, Morris Borsodi, Mabel Lazarus, George Nunner and Alois Orlik hold an interest in the concern.

Los Angeles, Cal.—The Western Duryee Manufacturing Company is soon to build a \$75,000 plant for the purpose of manufacturing automobiles.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

* Unlisted. † Ex div.
 a The United Railways & Electric Company comprises in its organization the Baltimore Consolidated Railway Company, the Baltimore City Passenger Railway Company, all the lines of street railway operated by these companies, and also the Central Railway Co. of Baltimore. The pref. stock of U. R. & E. Co. has been issued in the form of income bonds.
 b Leased to Boston Elevated Railroad Company.
 c Owned by Brooklyn Rapid Transit Company.
 d Leased to Brooklyn Heights Railroad Co., which guarantees 10% on capital stock.
 e Stock owned by Brooklyn Rapid Transit Company; road operated by Brooklyn Hts. Co.
 f Stock owned by Kings County Traction Company; road leased to Nassau Electric RR.
 g Owned by Atlantic Ave. RR. and leased to Nassau system.
 h \$20 per share on outstanding capital paid as rental by lessee—West Chicago St. RR. Co.; \$200 of stock owned by North Chicago Street Railroad Company.
 i Controls by lease Chicago West Division Railway, Chicago Passenger Railway, and West Chicago Street Railroad Tunnel Company.
 j 35 % per annum paid on outstanding capital as rental by lessee—North Chicago Street Railroad Company; \$625,100 of stock owned by West Chicago Street Railroad Company.
 k Majority of stock owned by Chicago West Division Railway Company; 5 % on \$1,000,000 stock guaranteed by Chicago West Division Railway Company, lessee.
 l Cincinnati St. Railway purchased the Mt. A. & Eden Park road, assuming its bonds.

* Unlisted. † Full paid. ‡ Outstanding. § Ex-div.
 a Leased to New Orleans Traction Company at 6 % on stock.
 b Leased to New Orleans Traction Company at 8 % on stock.
 c Leased to Central Crostown Railroad at 8 % on stock and interest on bonds.
 d Operating the former Met. Trac. system, that corporation having become extinct.
 e Leased to 23d Street Ry. for 99 years; lease assigned to Metropolitan Street Ry.
 f Leased to Houston, West Street & Pavyonia Ferry—now Metropolitan Street Ry.
 g Leased to Metropolitan Street Ry. at 8 % on stock until Oct. 1, 1897; thereafter 9 %.
 h Leased to Metropolitan Street Ry. for 99 years from Jan. 1, 1893, at \$215,000 per annum.
 i Leased to Met. St. Ry. for 99 years from April 20, 1892, at \$145,000 per annum.
 j Leased to Metropolitan Street Railway for \$145,000 per annum.
 k Leased to Metropolitan Street Railway for 18 % on capital stock.
 l Controlled by Third Avenue Railroad by purchase.
 m Dividends of 1 1/2 % yearly guaranteed by Consolidated Traction Company.
 n Controls by lease the Allegheny, Cent., Citizens' Duquesne, Fort Pitt & Pitt's Traction.
 o Leased to Consolidated Traction Company for 8 % per annum on par value of stock.
 p Leased to Fort Pitt Traction Company for 6 % on \$8,000,000 capital stock.
 q Leased to Consolidated Traction Company for 4 % on capital stock.
 r Leased to Consolidated Traction Company for 7 % on capital stock.

TELEPHONE AND TELEGRAPH CO.

- * Unlisted. † Paid in. ‡ Full paid. § Outstanding. ¶ Ex-div.
- a Leased to Hestonville, Man & Fairmount Passenger Ry. for 6% on stock per annum.
- b Consolidation Electric, People's and Philadelphia Traction companies. Fixed charges and all indebtedness of constituent and leased companies assumed by Union Traction Company.
- c Practically all shares owned by Union Traction Company.
- d Lease to Frankford & Southwark Passenger Ry. assumed by Electric Traction Co.
- e Leased to Electric Traction Company.
- f Controlled by Frankford & Southwark Passenger Railway.
- g Leased to People's Passenger Railway at \$5 per share.
- h Majority of stock owned by People's Traction Company.
- i Leased to Union Traction Company.
- j Lease transferred to Union Traction Company.
- k Leased to Union Traction Company at a rental of \$10,000 per annum in 1886-7-8; in 1890-1899 and \$30,000 per annum thereafter, payable semi-annually, rental decreased as a dividend semi-annually.
- l Dividend of 10% guaranteed by Reading Traction Company.
- m Dividend of 6% guaranteed by Reading Traction Company.
- n Leased and operated by the Scranton Railway Co., formerly Scranton Traction Co.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16½@16¾c.; Lake, 17@17½c.; casting, 16½@16¾c.

The American Light Company of Philadelphia has been incorporated at Wilmington, Del., with a capital of \$5,000,000.

The advance in Western Union was on the report of an increase in the company's capital, with valuable rights to stockholders.

The Detroit United Railway Company has declared a quarterly dividend of 1 per cent., payable June 1. Books close May 13 and reopen June 2.

Parties who are in touch with the affairs of the General Electric Company state that from present indications the company will show earnings of \$50 per share for the stock this year.

The Delaware General Electric Company has mortgaged its property to the Knickerbocker Trust Company of New York for \$1,000,000 to provide funds for construction of the Kent County trolley.

Within a week electricity will permanently replace steam as motive-power on the Consolidated Railroad's branch line between Providence and Bristol, 14 miles, and Providence and Fall River, 19 miles.

Kidder, Peabody & Co., of Boston have closed subscriptions to the \$2,500,000 American Telephone and Telegraph Company's collateral trust 4 per cent. bonds. The bonds have been largely over subscribed.

The Metropolitan West Side Elevated Railway Company of Chicago made a good showing in April traffic. The daily average traffic in April was 97,018 passengers, against 90,430 in the same month last year.

It is reported that within the next few weeks contracts for more than \$1,000,000 worth of new machinery for the Westinghouse Electric Company will be awarded from the Pittsburg and London offices.

At the annual meeting on Monday of the New England Telephone and Telegraph Company the old board of directors was re-elected. Frederick P. Fish was elected to fill the vacancy of J. E. Hudson deceased. No other business was transacted.

Special meetings of the New York Gas and Electric Light, Heat and Power Company and the Edison Electric Illuminating Company of New York will be held at the company's offices in this city May 20 to vote upon a proposition for the consolidation of the two companies.

Exports of copper for the month of March, as compiled by the United States Bureau of Statistics, amounted to 6,465 tons. During the month of March 2,687 tons of foreign copper and 22,852 tons of ores were imported and 773 tons of copper and 957 tons of ores were re-exported.

The following are quotations for some of the industrial stocks not quoted elsewhere: Electrical Lead Reduction, 4½@5; Electric Boat, 17@21; Electric Vehicle, 10@12; Tel. & Tel. Company of America (full paid) 5½@7; Electric Company of America, 8¼@9; National Carbon, 15¼@15½.

A prominent American Railways interest says: "The matter of a combination of our company and the Electric Company of America has not been placed before either board, but representatives of both companies have met and talked it over informally. I have not heard the question discussed for the last six days, but the idea has not been abandoned."

A dispatch from Boston on Monday says: "Directors of the American Telephone and Telegraph Company say that there is no truth in the rumor that a consolidation of the Western Union, American Telephone and Telegraph Company and other companies is under consideration. If such a plan is being contemplated the directors of the American Telephone and Telegraph Company have not been consulted."

The Union Traction Company, with a capitalization of \$15,000,000, has been incorporated under the laws of Indiana. The company is formed in the interests of the Widener-Elkins-Dolan syndicate. The companies, the securities of which it is intended to pool in the Union Traction Company, are understood to be the Widener-Elkins-Dolan properties in the middle West. The new company has nothing to do with the Philadelphia Union Traction Company.

Redmond, Kerr & Co. offers for subscription at 100 and interest \$8,355.00 first and refunding mortgage 4½ per cent. gold bonds of the Connecticut Railway and Lighting Company. The books open at 10 o'clock Thursday, May 9, and close at 3 o'clock the same day. The bonds are secured by first mortgage, subject only to \$995,000 underlying bonds upon 161 miles of street railway. A large amount of the bonds have been sold to investors and the bankers now reserve the right to allot smaller amounts than applied for.

The approval on Friday by the Massachusetts Railroad Commissioners of a consolidation of the Lynn and Boston Street Railway with the Lowell, Lawrence and Haverhill Street Railway will leave the Lynn and Boston with 61,230 shares of stock representing, what was 18 months ago, 14 corporations. This consolidation leaves but one operating company north of Boston, with 390 miles of track, reaching from Boston to Nashua. The management has under consideration a change of name for this company which will be as comprehensive as the name of the Old Colony Street Railway is to the roads south of Boston.

Messrs. D. Houston & Co., metal brokers, New York, in their regular monthly letter, say: "Although nothing of an exciting character occurred in the market for copper during the past month, there was a good current demand reported, while at the same time the movement into consumption continued on a large scale. Values were maintained on the basis of 17 cents for Lake and 16½ for electrolytic, and the tone was remarkably steady throughout the whole of April. Evidences are accumulating that one of the objective points sought is permanent market stability without the danger of serious drawback."

ELECTRICITY.

VOL. XX.

NEW YORK, MAY 15, 1901.

NO. 19.

ELECTRICITY

Published every Wednesday by the
ELECTRICITY NEWSPAPER COMPANY.

Publication Office, - - 136 Liberty St., New York.
Long Distance Telephone, 4021 Cortlandt.

SUBSCRIPTION RATES:

UNITED STATES, ...	\$2.50
IN CLUBS OF FIVE OR MORE, ...	2.00
FOREIGN COUNTRIES, ...	4.50
SINGLE COPIES, ...	10 cents

Remit by Express, Money Order, Draft, Post Office Order or
Registered Letter.

ADVERTISING RATES.

As ELECTRICITY reaches all classes interested in electrical
work, its value as an advertising medium can be readily un-
derstood. Rates will be sent on application.

Changes of advertisements should reach the office not later
than the Saturday preceding the day of publication.

Entered at the New York Post Office as second-class mail matter

EDITORIAL NOTES.

The Horse Shoe Falls at Niagara to be Utilized for Developing Power.

It has frequently been stated that there is sufficient power in the water going to waste at Niagara Falls to move, were it properly harnessed, all the machinery of the world. Thousands of electrical horse-power are already being developed in that locality, and now it is officially announced by the Niagara Falls Power Company that it will at once proceed with the development of the power of the Horse Shoe Falls under the charter of the Canadian Power Company, which it controls. It is proposed ultimately to develop 35,000 horse-power, much of which will be sold to local consumers, about 10,000 horse-power will be transmitted to Toronto and a large amount will be held in reserve for use in connection with the development on the American side of the river. The site of the development is in Victoria Park, but all of the energy generated will be used outside of the park grounds.

It is proposed to construct an inlet canal from the head of Clear Island to the site of the power house where a wheel pit, with a capacity of 100,000 horse-power, will be built. A tall race will carry the water from the turbines to the river below the Horse Shoe Falls. The head of water will be about the same as on the American side of the river and the details of the present Niagara development will be adhered to. The two power houses of the Niagara Falls Power Company at the Falls and the new proposed power house on the Canadian side will be connected by cables, so that an international exchange of electric energy may be made to assure constant service in Niagara Falls; Buffalo and Toronto.

By the agreement between the Commissioners of Victoria Park and the Canadian-Niagara Power Company, the company has until July 1, 1903, to have 10,000 developed horse-power ready for use, supply and transmission and also to have water connections made for 25,000 hp. The company has until July 1, 1904, to clean up and ornament the surfaces of the park which may be disturbed by their work. If the cleaning up and grading are not completed at the time specified then the company is to pay \$10,000 damages and \$500 per week during the period it remains incomplete. The Commissioners on their part agree not

to compete in the development of power, but should they grant privileges to other parties who shall fail to keep their agreement and the Commissioners be forced to take over the plant, then the agreement will not prevent them from operating such works. The power company agrees not to amalgamate with any other company heretofore or hereafter incorporated under the laws of the Dominion without the consent of the Lieutenant-Governor in council.

* * *

The Summer Meeting of the Institute.

The preliminary programme of the summer meeting of the American Institute of Electrical Engineers has just been made public. This programme, which, however, is subject to revision, contemplates having the members of the Institute, as well as the European guests, meet on August 14 in this city, when a formal reception will be held. On the two following days technical visits will be made to important works and installations in this vicinity, while on one of the evenings a banquet will take place.

On Sunday, August 18, there will probably be a daylight trip up the Hudson to some convenient point, where the members and their guests will take train for Albany. On the 19th the works of the General Electric Company at Schenectady will be visited, after which the party will go by special train to Buffalo.

On Tuesday morning, August 20, the General Meeting will open at Buffalo, in the Temple of Music, with addresses by the Exposition and municipal officials. A preliminary visit will be made to the Exposition in the afternoon.

On the three following days there will be sessions for the reading and discussion of papers in the forenoons, and perhaps on some of the afternoons. The Director-General has designated August 22d as "Electrical Day." The programme contemplates the allotment of an entire day, if possible, for an excursion to Niagara Falls and the various electrical features to be seen at that place. An opportunity will also be afforded the party of visiting the various sub-stations in Buffalo. The closing meeting will probably be held on Saturday, August 24.

The plan outlined would seem an excellent one, and if carried out as now suggested will afford the members of the party a most enjoy-

able outing, at the same time furnishing them an opportunity to see the sights at Buffalo in connection with the Pan-American Exposition, to say nothing of the principal electrical undertakings of the country, to be met with in New York, Schenectady and Niagara Falls.

* * *

The Glasgow Exhibition and Trolley System.

While the Pan-American Exposition is attracting general attention on this side of the Atlantic the eyes of the British public are focused on the Glasgow Exhibition. Our London correspondent states that on April 25 a company of press representatives were allowed to view the exhibition, and the things there seen confirmed the opinion that from an electrical and machinery point of view the show will be an excellent one, far in advance of anything that has been held in that country for many years. The collection of machine tools, engines and dynamos is well worthy of mention, American apparatus especially being largely represented.

The day previous to the press visit to the Exhibition the first fifty-four miles of the much talked of Glasgow municipal electric trolley system was inaugurated with befitting ceremony.

The large generating station which contains the rival steam engines and the four 2,500 kw. three-phase generators (75 r.p.m., 6,500 volts) is not yet quite completed. The station was described by the consulting engineer Mr. H. F. Parshall, when speaking at the function as the finest power station in the world. The station equipment also comprised two 600-kw. 600 volt dynamos running at 90 revs. The electrical contract also included 160 100-kw. oil transformers to work at 25 cycles per second, 6 50-kw. 100 volt exciter dynamos running at 300 revs., and 24 rotary converters and boosters combined. The power station and its equipment have cost \$2,500,000 while the capital outlay on the whole undertaking including 31 miles more of double track (making a total of 75 miles) will eventually be over \$10,000,000.

This installation does not apparently come up in point of size and cost with the principal electric system in New York City, but it nevertheless is well worthy of note and is claimed by those who have inspected it to be a model of its kind.

* * *

The Crash in Wall Street.

Owing to a combination of local circumstances, and to the fact that the general public has of late gone mad on the subject of stock speculation, on Thursday, May 9, there occurred a panic on the New York Stock Exchange such as has not been witnessed for many years. The saying that "whatever goes up must come down" was forcibly demonstrated last week. Stocks that had never paid a dividend were quoted above par and values throughout the whole list were inflated, with the result that a fight by two millionaire interests to secure control of a certain railroad precipitated a crash that was bound to come sooner or later. During the time the panic lasted—some two hours—stocks dropped anywhere from ten to fifty points. General Electric opened at 220 and dropped to 200, and at the close of the day was quoted at 210. Brooklyn Rapid Transit, which opened at 76½, dropped to 68½, and finally came back to 72½. The local traction stocks

suffered severely, especially Manhattan, which went off from 120 to 83, closing at 109. Metropolitan sunk from 165½ to 150, and went back to 158. Western Union was no exception to the rule and dropped from 92 to 85, going back at the close of the market to 89.

The electrical securities referred to above suffered less than the railway shares, which in a number of cases showed a net loss at the closing of the market of from ten to twenty-five points.

It is to be hoped that a lesson has been learned and that the next year or two will see no more inflated markets or South Sea bubbles to be pricked.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

AN electric street car company has been organized in Merida, Yucatan, with an authorized capital stock of \$400,000.

THE board of naval officers, headed by Capt. Chadwick, appointed to make a full investigation and report on wireless telegraphy, has completed its work. The board reports on the entire feasibility of the system and recommends that it be adopted and that the present system of using carrier-pigeons for messages between naval points be abandoned.

CONSUL-GENERAL PATTERSON at Calcutta, India, in a report to the State Department, says that there may be an opportunity for our manufacturers of electrical machinery to secure the contract for the proposed electric plant to be constructed at Lahore, the capital of Punjab. Besides Lahore, which has a population of about 200,000, the cities of Madras, Delhi, Lucknow, Allahabad, Agra, Cawnpore and Benares, all in India, have no electric plants, with the exception of Madras, which has one for tramways, but not for lighting. The Consul-General says that electric lighting, though introduced into Calcutta only last year, is coming into general use.

MANY persons narrowly escaped death in an accident to a trolley car of the New York and New Jersey Traction Company at the village of Leonia, two miles from Englewood, N. J., last Sunday afternoon through the failure of the brakes on the car to operate properly. As many as twenty persons were hurt more or less seriously. The cars on this line which are unusually large are equipped with four motors and two brakes—an ordinary brake and a friction brake. Car No. 12, the one to which the accident occurred, got beyond the control of the motorman after leaving Leonia Heights and came down the steep hill into Leonia at a speed of probably thirty miles an hour. That the motorman made frantic efforts to stop the car is testified to by a representative of ELECTRICITY who was on the spot. As the car reached the sharp curve at the foot of the hill, the body of the vehicle tore itself loose from the trucks which jumped the track and fell violently on its side. This accident emphasizes most forcibly the need of careful and frequent inspection of the braking mechanism, especially on a road on which very steep grades are met with.

CONSUL GENERAL GUENTHER of Frankfurt, in a recent report to the State Department at

Washington, says that a Berlin engineer has constructed a trolley automobile line similar to that exhibited at the Paris Exposition, at Eberswalde, a small city near the German capital. In this system, continues the Consul-General, the automobile receives its motive power from an overhead wire by means of a trolley, which is connected with the automobile by a movable cable. This allows the vehicle to turn out at any place on the road. The Consul-General adds that the line has been favorably inspected by experts and that the system is expected to meet with general favor in Germany.

A BOHEMIAN farmer with the euphonious name of Michaelis Quentesky, located near New Egypt, N. J., is being sued by the Bordentown Trolley Company for the larceny of electric current. It seems that for some time, the trolley company has been wondering how it happens that it required a greater amount of electric current to run the Bordentown branch than it did to run any other road of similar length and grade in the country. After considerable investigation by electrical experts it was discovered that the ingenious Bohemian farmer referred to above had tapped one of the main feeders, and was utilizing the current thus obtained to stimulate the growth of certain crops on his farm. A perfect network of wire was discovered under a truck patch 300 feet long by 200 feet wide in which radishes were grown, which are claimed to have matured in nineteen days, whereas radishes grown under ordinary conditions, required six weeks. Apparently the question for the judge to decide is, what number of amperes of current equals one month's natural growth of a radish in a sandy soil?

CONSUL JONES of Funchal, the seaport of the Madeira Islands, says that the Eastern Telegraph Company has finished laying a cable from Falmouth to St. Vincent, Cape Verde Islands. It passes through the office of the Western Telegraph Company, limited, at Funchal, and is worked in connection with the Cape-St. Helena route. The latter company has landed four cables at Funchal—two to Lisbon and two to St. Vincent. One of the Lisbon cables is continued to Brazil, and connects that country with Europe. The direct cable route from Funchal to the United States, adds the Consul, is via Lisbon and the Azores. The tariff to New York is about fifty cents a word.

THE Municipal Council of Leeds, one of the most prosperous manufacturing cities in England, is considering the expenditure of some \$2,500,000 for the purpose of electric lighting. The Council's scheme includes the extension of the present works, the installation of engines and dynamos, the introduction of a new plant and the laying of mains in various parts of the city. During the last two years some \$700,000 was expended by the city authorities for machinery, etc., contracts for a fair portion of which went indirectly to manufacturers in the United States. American firms interested should address Mr. Dickenson, manager of the Leeds Corporation electric lighting plant, Leeds, Yorkshire, England.

A REPORT from Brussels states that the Central African Telegraph Line connecting Brazzaville with Loango, on the west coast, has been completed, and that direct communication

tion with Libreville may be had from any station of the English-Atlantic cable. The cable from Brazzaville to Stanley Pool, which is being laid to connect with the telegraph system of the Congo State, will ultimately be extended to Lake Tanganyika, where it will form a conjunction with the German East African system.

REPORTS received from the various committees, which have in hand the perfecting of arrangements for the annual convention of the Canadian Electrical Association, to be held at Ottawa, are of a most satisfactory character. An excellent list of papers has been secured. Interesting reports will be presented by special committees appointed at last year's meeting to consider certain matters affecting the welfare of the electrical companies. The constitution of the association has been carefully revised and improved in many points and rendered more workable. The local committees are exerting themselves to the utmost to give to the convention an interesting, enjoyable and profitable time. A satisfactory attendance of the members is now the only requirement for the success of the meeting. The dates selected for the convention are the 19th, 20th and 21st of June, the most enjoyable season of the year, when most people are looking forward to an outing. All of the conditions are therefore favorable to a large gathering of electric men at the Canadian capital.

RECENT experiments in wireless telegraphy off the coast of Malta have resulted in the successful transmission of a message 134 miles, according to United States Consul Grout at Malta, in a report to the State Department. The message was received in an unexpected way. While experimenting on a ship in the open sea, the Consul says, the operators were surprised to receive a message in Italian asking as to the position of their ship. It afterward developed that the message came from an Italian war vessel at Syracuse.

WHAT is truly a record feat in wireless telegraphic communication, certainly so far as the navy is concerned, says the London "Electrical Engineer," was obtained a few days back when a message was received on board the Hecator at Portsmouth from the naval authorities at Portland. The distance at which the information was taken off was 103 miles as the crow flies, and this new achievement is regarded as exceedingly gratifying. Previously to this, messages had also been received on board the Hecator from the Majestic, some 90 miles away.

DURING the past ten years many inventions have been heralded throughout the country threatening to drive the telegraph operator out of business. Up to this time none of them have succeeded in doing so. The key which transmits the Morse signals to-day is practically the same used by Thomas A. Edison, Andrew Carnegie and other telegraphers thirty years ago. The twentieth century telegraph key, designed by a prominent official in one of the large telegraph companies, is intended to increase the speed of the operator, and to prevent telegraphers' paralysis. It is a radical departure from the one now in use. It consists of a handle that may be grasped by the whole hand or operated by the touch of any finger or part of the hand. It is unnecessary to retain a firm hold upon this handle, and the

fingers may be shifted as desired during transmission. It can be turned completely around at will, so that any desired position may be secured instantly. It is the cramped position of the fingers on the familiar key-knob that causes paralysis of the operator's wrist, or at least great distress. This instrument has been in use on the "Journal-Examiner" leased wire, working direct from New York to San Francisco, a distance of 3,500 miles, a speed of 3,000 words an hour being maintained.

CHARLES BLETTERMAN ELLIOTT, the retiring general manager of the Cape Government Railways, has been appointed a Commissioner to tour in England, Continental Europe, and the United States, for the purpose of inquiring as to the best systems of electric lighting, carriages, and other railway construction with a view to extensions. He is empowered to order material and rolling stock for the construction of the new light railways.

IN the course of an article reviewing the possibilities of the accumulator for boat propulsion from a commercial point of view, Mr. E. W. Ehnert, in the "Elektrotechnische Anzeiger," makes some interesting comparisons between the respective merits of steam and electric propulsion. Apart from the superior cleanliness and decreased vibration obtained with the latter, the writer points out that the commercial possibilities of the accumulators for the purpose in question depends upon the employment of the boat. As regards the annual cost of maintaining a boat in constant service, the advantage rests undoubtedly with electric propulsion—for instance, when the vessel is required for police duties in a harbor, or is a pilot boat. Such boats must be kept in a state of constant readiness for service, which, when steam propulsion is used, means a constant expenditure of fuel, while an electric boat consumes no energy when stationary. Experience, further observes the writer, with accumulator boats points to the advisability of employing Planté-formed plates, despite their greater cost and weight, as compared with paste plates.

GERMAN invention has given electric eye glasses to the world. They are claimed to restore dimmed or darkened vision. The glasses are about the same size as an ordinary pair of spectacles, but the frame is made of thin layers of copper and zinc. These metal sides are moistened with some dilute acid, and an electric current is thus caused to flow through the eye nerves, resulting in better vision.

IN Sweden in future all the principal railway trains will carry a telephone apparatus which may be connected with the telegraph wires, and thus communication be established with the nearest station. The arrangement is, of course, invaluable in case of accident. The apparatus is set in working by the coupling of one telephone wire on to the telegraph line and another to the rails.

A VERY peculiar system of electric traction, the invention of two young Belgian electricians, is now being tested at the works of M. Jules Dulait, says the "Engineer and Iron Trades' Advertiser," of Glasgow. In this system the line itself is practically the stator of a

gigantic three-phase motor, whilst the moving car is fitted up as the rotor of the motor. In short, if the stator of a three-phase motor was opened out straight it would represent the track on the new system, whilst a section of rotor would represent the moving car. The three-phase currents in the line form a traveling magnetic field. At the same time currents are induced in the windings carried on the car, just as they would be in the windings of a rotor, and the attraction between these currents and the traveling magnetic field provides the necessary tractive force. It will be seen that, as no current enters the car from the line, no form of trolley is needed, and in no portion of the system save in the generating stations themselves is there moving machinery. The inventors expect to obtain good results in working high-speed traffic, but admit that it is quite unsuitable for trains running at speeds of 20 miles an hour or so. It is obvious that before making their system a commercial success, the inventors will have to solve many mechanical and electrical problems.

A COMMITTEE of experts appointed by Postmaster General Smith to investigate the workings of the pneumatic tube system of carrying mails in cities has reported its conclusions that on the present basis of cost the system is too expensive. The committee declares, however, that a system to be operated by electricity is in process of development, which bids fair to be successful. Essentially, the system is simply a three-rail trolley road, operated in a tube. The tracks would be laid, insulated, and bonded before the top was fastened down. The carriers would be built with slightly rounded corners, so as to conform to the turns made at street corners. The carriers and their motors would be operated between guides. By cutting the tracks and the introduction of a system of looping, well understood by electrical engineers, the speed of the carriers would be lessened at corners and also when approaching stations.

A PROBLEM will confront General Greely, Chief Signal Officer, when he invades the Philippine archipelago in July. His force of officers will be cut in twain at that time, and his struggle will be, after inspecting the situation with his own eyes, to map out the remaining work of the Signal Corps so that fifteen officers can perform the duties hitherto distributed among thirty. The red lines on the latest military map show a system of land wires and submarine cables stretching between extremes about a thousand miles apart, but so ramified as to compose a total length of between 4,200 and 4,300 miles, or enough to make a line from San Francisco to New York and back to Chicago. Over this system there passes an average of 10,000 Government messages a day, these messages averaging at least 100 words, so that in round numbers, it may be said that 1,000,000 words are transmitted daily by telegraph on Government business. This is almost a necessity of the situation, in view of the absence of any proper facilities. It is the only efficient means of communication between the military and other functionaries of the Government. The abundant use of the wire, indeed, has given rise to a witticism by one of the signal officers, speaking of his army brethren at a certain headquarters: "They never send any dispatches; they merely file letters."

"Electricity's" Educational Series.

BY R. MAX EATON.

ARTICLE NO. 27.

THE DIFFERENCE IN "GROUND" POTENTIAL.

To illustrate more clearly what is meant by the above phrase, let me explain by supposing that the earth constitutes a conductor over which a current is flowing. If there were positively no resistance in the ground then there would be no difference of potential in the electric current flowing through it and consequently there would be no difference in potential between any two points of the earth which comprised this circuit. This is not the case, however, and a resistance does actually exist in the earth to a flow of current causing a potential difference between the two points which constitute each end of the circuit and also between any two points effected by that current. The idea can be very well illustrated by permitting a current to flow over a bare copper wire and then by the use of a mill-voltmeter noting the voltage between any two points on the wire. The volts or fraction of a volt indicated by the instrument will represent the potential difference between the two points to which it is connected.

If a current is passing through a resistance coil and a reading be taken with a voltmeter connected across the two terminals of the coil a certain voltage will be indicated which will represent the difference of potential or voltage between those two points of the circuit. This difference is of course caused by the fact that a resistance exists in the circuit and to the flow of current. If no resistance existed there would be positively no difference in the electrical pressure between the two points. Now applying these illustrations to earth circuits the same governing influences come into effect. The ground offers a resistance to the flow of an electric current depending on certain conditions of conductivity. When this resistance exists then a difference in the potential of the flow of current must also exist. If the ground were only used as a return for some one circuit, this resistance offered by it would be of no particular consequence because it could be effective only in relation to that one circuit, but this is not the case, as the earth is used as the one side, or return, for innumerable circuits of all kinds.

Potential actually means power of doing work, so that if there is a difference of potential between any two points it simply means that there is a difference in the power of doing work of the electric current. This difference in power of doing work is a result of work having been performed. The fact that a resistance to the flow of current through the earth exists causes the current to do work in overcoming that resistance, and the fact that the current performs work causes it to be reduced in its power of doing work, which gives us what we know as a difference of potential between two points in the earth, or what is often termed a potential difference between two "grounds."

If a difference exists in the power which an electric current has for doing work it must be because some work has been done, and so long as there is a resistance to a flow of current work must be done in overcoming that resistance. The work done by electric currents passing through the ground, in what is known as return ground circuits, is varied and depends entirely on the influencing conditions and the amount of current flowing. Some of the work performed may be the production of heat, the decomposition of water, the electrolytic deposition of metals, and the decomposition or eating away of metals, generally known as electrolysis or electrolytic action. It would be almost impossible to enumerate the different kinds of work performed by earth currents in endeavoring to reach their low potential pole.

The difference of ground potential and its effects is only noticeable to any great extent in towns and cities, and there the effects are often disastrous to water mains gas pipes, etc. The effect produced by these conditions is commonly known as electrolysis and did not enter into any degree of prominence in engineering until after the introduction of the electric street railway with its return ground circuits and heavy currents. Usually railway power plants are connected with the positive pole of their current fed to the overhead conductors, while a return is provided by the conductivity of the rails, supplemented by heavy copper cables connected at frequent intervals to the rails, which in turn are bonded together by connecting links of wire to insure good conductive qualities at the connecting joints. It would appear as though the current would follow the rails and copper cables in its return rather than leaking to ground and causing electrolysis. This of course is true as far as the major portion of the current is concerned, provided proper construction exists relative to the carrying capacity required, but it must be remembered that any circuit offers a resistance to a flow of current to a greater or less degree, and if a parallel circuit is provided or exists then the amount of current which will travel over this parallel conductor is in proportion to the relative resistance between the two.

Understand then that the earth is a parallel conductor to a return ground, when a return is provided other than the earth circuit, so long as the return is grounded; in fact, the earth circuit comprises a part of the entire circuit and as a result must be effected by the current, and if the conditions are favorable electrolysis will result.

The most disastrous effects as a result of this condition are generally caused by points of high resistance in the provided return, such as corroded joints, broken bonds, etc.

I have heard of several engineers reversing the direction of the current, that is, connecting the positive pole to the ground, as a preventative of electrolytic action, but I fail to see first how the direction in which the current flows through the earth would make any difference, and as a matter of fact, it does not.

Not only is the flow of current through the ground caused by street railway operations, but also by numerous commercial circuits, telephone, telegraph and some systems of electric light, although on account of the amount of current used by street railway operation most of the electrolytic results are attributed to that cause. The effects of this besides re-

sulting in electrolysis, also interferes with the operation of telephone and telegraph systems where ground circuits are used, and many varied and ingenious devices and circuits are provided overcoming or counteracting the effect of the difference of potential.

Article No. 28 will be entitled "The Electrolytic Deposition of Metals."

THE SOLDERING OF ALUMINUM.*

During the past few months there has been a regular revival of interest in the soldering of aluminum, and many of the papers have been busily engaged in discovering and describing novelties which are several years old, while others have been carefully giving a wrong or imperfect explanation as to why aluminum is so difficult to solder with perfect success. Although we do not by any means intend to imply that aluminum can ever be soldered with the ease and dispatch with which that operation is conducted on brass, galvanized and tinned iron, yet the metal is capable of being united by the bit somewhat more readily than most people seem to imagine, provided a proper kind of solder is employed in the proper kind of way. There are two totally distinct obstacles to be overcome before a satisfactory joint in sheet aluminum can be made by soldering. The first is to find and use some material which will be permanent in damp air, water, etc., when it is in good electrical contact with so electro-positive a metal as aluminum; the second is to apply that material to a metal like aluminum, which is always covered with so closely adhering and rapidly growing a film of oxide. Now, it is clear that the stability of the soldered joint on exposure will depend entirely on the composition of the solder adopted; but the ease of application of that solder will depend partly on its own composition, and partly on the initial preparation of the aluminum surface.

To make a valuable solder, then, four points have to be considered. It must be composed of some metal or alloy which fuses at a low temperature, so that it shall flow smoothly from a copper, nickel, or aluminum soldering bit. It must not oxidize appreciably nor segregate when heated to its melting point on the bit. It must, as a whole, be as electro-positive as possible, so that it may not be capable of forming with the aluminum object to which it is applied a galvanic couple of sensible voltage. The fourth requirement concerns the aluminum surface itself; it must be cleaned from its film of oxide either by mechanical or chemical agency during the act of soldering, that is to say, while the metal is protected (if possible) by the molten solder from the surrounding atmosphere. The selection of a metal or of several metals to form an alloy of any desired melting point is not a matter of great difficulty. Many such compositions have been used for soldering other metals for generations; there is no particular trouble in finding something to match the peculiar shade of white exhibited by commercial grades of Héroult aluminum so that the joint may not be conspicuous to the eye. The question of galvanic action between a metal and its solder, on the other hand, has scarcely ever been of much practical importance hitherto: and our practical metal workers are rather apt to over-

*From the "Electrical Review," London.

look or ignore the necessity for investigating the matter now that aluminum has become of industrial significance. This is only natural; for with due skill the coating of oxide on aluminum can be removed, and almost any well-known solder stuck on to the metal, thus forming a joint which for an hour, day, or week appears perfect, has perhaps greater mechanical strength than the aluminum itself, and conclusively demonstrates to the happy inventor that he has discovered another "fortune." In a month or so, maybe, the joint fails, either the aluminum or the solder crumbling to pieces, and then the experiments have to begin again in the previous haphazard fashion.

By consulting almost any of the text-books a list of metals arranged in galvanic series can be drawn up or met with, and if the book be not too old the position of aluminum in relation to other metals suitable for the preparation of a low temperature solder can be studied. Unfortunately, the tables given by our authorities are generally based on the behavior of metals when exposed to certain laboratory acids, alkalies, and salts, and not to the damp air or weak aqueous carbonic acid of everyday life. For this reason the data must be used with caution, as the series vary somewhat in order according to the nature of the electrolyte selected. Indeed, it seems possible that in this variation may be discovered one of the reasons—completely inevitable so far as it goes—for the occasional failure of aluminum, soldered or not, during exposure. Under oxidizing influences aluminum closely resembles the metals of the alkalies and alkaline earths, being much less permanent than manganese, zinc, iron, etc.; under chlorinating influences aluminum resembles the last three metals, and is much more stable than sodium, calcium and magnesium. Thus if any neighbor for aluminum be chosen to avoid galvanic action under the attack of, say, hydrochloric acid—for which purpose manganese and zinc are indicated—that neighbor will be too negative when oxygen is the corroding agent. And, per contra, such a metal as magnesium, which lies nearest to aluminum when oxygen is the enemy, is highly positive when chlorine appears on the scene. However, it will be found that, roughly speaking, and in this particular of galvanic action alone, zinc is the best metal of which to make a solder for aluminum; then lead, and finally tin. The best of all is, of course, aluminum itself; but to solder aluminum with aluminum is to "burn" the metal, in the language of the plumber, and that is different from what is understood as soft-soldering. Nevertheless, there is no objection, and, indeed, there is much advantage, in having a certain proportion of aluminum in the solder which is to be used with the bit.

Turning now to the problem of removing the film of oxide from the surface of the metal before soldering; we are met by the practical difficulty that the obvious agent, hydrochloric acid or something similar, is far from being perfect, or even satisfactory; for although it readily dissolves the alumina, before the solder can be applied the acid becomes neutralized by the excess of metal, the aluminum chloride seems to be ineffective in protecting the surface, and a fresh coating of oxide forms instantaneously. To meet this objection it is possible either to clean the metal mechanically underneath the layer of liquefied solder in the act of soldering, by filing, rubbing, or scratch-

brushing and the like, or to incorporate into the solder some substance which is competent to decompose, remove, or dissolve the oxide. Methods for effecting this mechanically in the manner indicated, have frequently been suggested and patented, and we believe in skillful hands they all work more or less satisfactorily. A wire brush seems the most natural thing to use, but it is only available where the joint is on fairly stout metal and in an accessible situation. An idea for decomposing the oxide chemically has been patented lately by E. M. Totten, of Buffalo, and is being "boomed" considerably in the press at the present moment. According to the published descriptions of this process, the solder consists of aluminum, 20 per cent.; tin, 30 per cent.; zinc, 40 per cent.; a "hydrocarbon," 2 per cent.; and 8 per cent. of some unmentioned constituent. The "hydrocarbon" is to be fat or wax (these are not hydrocarbons, but no matter), paraffin, etc., and it is claimed to "increase the amount of carbon" contained in the solder, which carbon reduces the film of oxide (alumina) during the operation of soldering, and renders the scraping of the metal unnecessary. This claim is extremely interesting and instructive, because it has been known to students of electrochemistry for many years, ever since the advent of the Cowles method of making aluminum bronze—and, indeed, before that time—that alumina cannot be reduced by carbon except at the temperature of the electric furnace, so that even if Mr. Totten's process actually does what it is represented to do, the carbon in the solder plays no chemical part in cleaning the metal.

Dr. Richards' solder for aluminum, which has just been discovered by several English papers, has been in existence for eight years. It was patented in Great Britain under the name of W. A. Briggs, on November 9, 1892 (No. 20,208). The active ingredient for removing the oxide is phosphorous, and according to the specification, the solder is prepared by mixing 32 parts of tin with 1 of phosphor-tin containing 5 per cent. of phosphorous, then adding 1 part of aluminum, previously melted with 8 parts of zinc. It was also stated in the English patent that the melting point of the solder might be lowered by increasing the percentage of tin, while its mechanical strength could be improved by raising the proportion of aluminum and zinc. Further experience with the material has shown, however, that the normal composition, as given by the formula of the specification, tends to liquefy when melted a second or third time; and so the solder is now composed of aluminum, 1 part; phosphor-tin, 1 part; zinc, 11 parts, and tin, 20 parts. It is used much in the usual way with a copper or nickel bit; but the aluminum requires to be first "tinned" (i.e., coated with the solder as is done in soldering copper or sheet-iron), before the two pieces which have to be united are brought together. No flux is employed either on the bit or on the sheets, as the contained phosphorous effects the cleaning necessary. This solder has been adopted largely in America, and yields results probably as good as can be expected with aluminum; it has also been recommended by the authorities of the Neuhausen Aluminum Works. It is known to be permanent for over three years, to be as strong as, or stronger than, the aluminum itself, to be reasonably cheap, to have a color matching well with the rest of the object, but to darken slightly after the lapse of time.

REGULATION OF MOTORS.*

A shunt-wound motor automatically maintains a constant speed under all variations of load, up to its full capacity, due to the following facts:

First—When the armature is revolving between the poles of its field magnets, the wires in the armature which give it polarity are dragged through the magnetic field in which the armature turns, and, of course, have a current generated in them, but in the opposite direction to the current which produces the magnetism which causes rotation, in accordance with Lenz's law, which says that "the movement of a conductor in a magnetic field induces a current that resists the original current which produced that motion," or, in other words, the direction of induced currents is always such as to oppose the motions by which such currents are produced.

This induction gives rise to what is known as counter electromotive force (EMF.), and is apparent in all types of electric motors.

There are three separate EMF.'s to be considered in this connection, as follows: First, the impressed electromotive force, or that supplied by the generator to the motor; second, the counter electromotive force, the difference between the counter and the impressed, and it is this which really accomplishes the work.

It is obvious that the faster the armature revolves, the greater will be the counter electromotive force.

This counter current flows no further than the brushes, or rather does not flow at all, but really maintains a balance between itself and a certain amount of the impressed, the difference represented in effective current acting reciprocally with the field magnets, and producing the rotary effect of the machine.

Theoretically, if a dynamo generating an EMF. of 100 volts at 2,000 revolutions per minute, be connected by wires with a motor of the same size, which requires 100 volts to drive it at a speed of 2,000 revolutions per minute, and there be no load on the motor, there will be practically no current consumed by the motor, and none generated by the dynamo; for it, i.e., the motor, will generate a counter EMF. of 100 volts, which, opposing the impressed EMF. of 100, will balance it, with the result that both machines will run at the same speed without the flow of any current.

As a matter of fact, some current does pass through the motor, namely, that necessary to magnetize its field magnets, and that required to overcome the inertia of the armature, friction of bearings, brushes, etc.

If we place a load upon this motor, the speed will be slightly decreased, perhaps only a very few revolutions, but sufficiently to reduce the counter EMF. This will naturally cause an increase in the effective EMF., for the "counter" diminishing, the "impressed" will force more current into the armature, thereby magnetizing it more, while the fields retain approximately their same strength, the tendency to rotate, torque or pulling power of the armature is increased just in proportion to the increased load, and the speed remains practically the same.

Should the load be suddenly thrown off, instead of racing or running away, the speed of the armature increases a few revolutions until the counter EMF. rises to its original strength,

*From the "National Engineer."

when it is maintained constant. Thus it will be seen that, under varying loads, the speed of a shunt-wound motor will be practically constant.

A series-wound motor, however, does not maintain a constant speed under variations of load, because the counter EMF., in opposing the impressed, tends to keep back the current from the fields to such an extent that they become weak, and the speed of the armature without load is almost unlimited, and while its starting effort or torque, under load, exceeds that of the shunt, it will not maintain a constant speed, but one which will always vary, depending upon the amount of work it is doing.

It is better to run a motor of large horsepower on a small load, than to use a motor of small horse-power and load it to its full capacity, because the larger the motor in proportion to the work, the less it will be obliged to accomplish per revolution, and the nearer will

FIG. 1.

the counter current approximate the impressed, and the resulting effective current will be comparatively small. So, if we have 3 hp. of work to do, it will be better to employ a 5 hp. motor than a 3 hp. motor, although, of course, the rule will not hold good indefinitely; for example, it would not be economical to use a 10 hp. motor to do 1 hp. of work.

When a motor is running without any load the back EMF. is so great that it allows little current to pass into the armature. As the load is increased, the speed is cut down, which reduces the back EMF. and allows a greater current to pass through the armature. This makes it a stronger electro-magnet, thereby making its torque greater, and it is better fitted to dispose of the extra work which it is called upon to perform.

Current must not be admitted to an armature from a dynamo, but must first be admitted to the fields, and after they have been magnetized sufficiently it is let into the armature by degrees.

If the whole current were allowed to go into the armature at first, it would burn it out before the current could go through the greater resistance of the field magnets and make a strong enough field to cause the armature to

FIG. 2.

rotate at sufficient speed to develop a counter electromotive force to reduce the current.

Motors are generally furnished with a rheostat, to be used in connection with them. The rheostat has two binding posts on top, Fig. 1, A and B, which are connected to the mains. There are generally three on the bottom of the rheostat. No. 1 is connected to one field coil and to one brush of the armature. No. 2 is connected to the other brush. No. 3 is connected to the other field coil.

When it is desired to start the motor, the arm of the rheostat, C, is moved far enough to touch the metal strip, D, but not far enough to cut in any of the rheostat coils. The current then passes in from one of the mains, goes through the field magnets, and out through the strip, D, and the arm, C, to the other main. The field magnets are thus energized before any current is allowed to go into the armature.

FIG. 3.

The arm is then moved until it touches the first disk, E, connected with the resistance coils, and the current has not only the path through the field magnets, but it can also go from one main through the arm, C, and all the resistance coils, then through the armature and back to the other main. Thus a very small current is allowed to go into the armature at first.

As the arm, C, is moved toward the left, more and more of the resistance is cut out, and more current is allowed to enter the armature,

until the arm reaches the last disk on the left, and all the resistance of the rheostat is cut out, as the armature by that time has developed a speed sufficient to cause enough back electro-motive force to keep the large current from harming it.

The head board of the motor generally has three binding posts, connected as shown in the sketch, which can be connected directly to the three on the rheostat.

Before the invention of the automatic switch, it was not as uncommon an occurrence to have the central station in a town shut down without warning, when probably a large number of elevators were being operated by electric motors, of from 5 to 10 hp. Of course, the motors will stop, but without the automatic starting boxes, the lever, C, Fig. 1 was left clear on, and the armature formed when standing still practically a short circuit on the line, and when the station, without warning, again threw the current into the line, the almost invariable result would be a burnt out armature. Occasionally, it is true, the safety fuses would melt first, but in the majority of cases the armature would go.

While the customer was in no way to blame for the burning out of his motor, he had no redress, and had to calmly pay for rewinding, which, in the large machines, amounted to considerable.

From this it will be seen that it is absolutely necessary to have an automatic device which will cut out the motor entirely when the cur-

FIG. 4.

rent is shut off, in order that when it is turned on again that the entire current will not go through the armature at once and burn it out. In these cases an electro-magnet, Fig. 2, A, is connected with the main line wire in the rheostat, and a small piece of soft iron, B, is carried by the rheostat arm.

When the arm has been removed to the last disk, the entire current is passing through the electro-magnet, which attracts and holds the arm by means of the piece of the soft iron, against the tension of the spring, S. If the current is shut off from the mains, the electro-magnet will lose its magnetism, the piece of soft iron will be no longer attracted and the spring will pull the rheostat arm back until the motor is cut out entirely. When the current starts up again, the motor is started in the usual way by hand.

It is evident from the foregoing, that the automatic switch box will immediately and effectually cut out the motor the moment the current supply fails. In order to reverse the direction of rotation of a motor armature, it is not sufficient to reverse the direction of current in the machine, but it

must be changed in either the armature or field magnets, without changing it in the other. To do this, as it is frequently required in connection with motors used for lathes or for elevators, special switches have been designed, in which the current in the field magnet is reversed by moving a lever forward or backward. It is much easier to reverse the field coils than the armature, because they only require about one-twentieth as much current and consequently the sparking will be much less.

Figs. 3 and 4 show two types of reversing switches. The first adapted to series motors, which require no resistance in the armature, and the second for use on shunt motors, showing resistance in armature circuit while starting the machine.

Various arrangements have been devised for the purpose of starting and operating motors at certain predetermined speeds without the use of rheostats. This is accomplished by placing the two field coils in series with each other, and in series with armature, then placing the two field coils in multiple with each other, and in series with the armature, and lastly by placing both coils and armature in multiple with each other and the line.

Motors from 1-16th hp. to $\frac{1}{2}$ hp. are not usually provided with starting rheostats, because their armatures are so comparatively light, and their inertia so small, that they spring quickly into motion immediately upon the passage of the current, and develop a counter electromotive force, sufficient to keep back an injurious current before the impressed has had time to do any damage.

This is not the case, however, in motors from $\frac{1}{2}$ hp. and upwards. Their armatures being heavy, they start slowly owing to their large inertia, and an excessively injurious current would enter before they could develop a sufficient counter E.M.F. to prevent it, were it not for the fact that in machines of this size rheostats are always used in connection with the armature circuit, the object being to first powerfully and fully magnetize the fields, and then to slowly admit current to the armature.

An ingenious method for governing the speed of motors is employed in the Excelsior machine when on series arc light circuits. The shaft carries a regular ball governor, such as is used on steam engines, but the connecting rod, instead of cutting on or off steam, moves a brush backward or forward over a straight commutating switch, thereby cutting in or out more or less field coils, which controls the speed by producing the proper intensity in the field, and maintaining its relation to the armature, whose intensity does not change at the degree necessary to do the required work.

Some Carbide Statistics

The amount of calcium carbide imported into Germany during the year 1900 was 7,681 metric tons, and the export 224 tons, says the "Electrical Review," London. In the previous year the corresponding figures were 6,374 tons and 636 tons. Estimating the quantity of carbide manufactured within the bounds of the empire at 2,500 tons in both years. The total German consumption for 1899 is seen to have been 8,238 tons, and for 1900 10,180 tons. Of the exports, 86 tons in 1899, and 26 tons in 1900, was sent to Australia. These latter are not very large figures, and they are fortunately decreasing; but they ought to disappear altogether, and the carbide required in the Commonwealth be either made locally or exported from Great Britain.

ELECTRIC MOTORS—A BRIEF OUTLINE OF THEIR CHARACTERISTICS.*

BY A. SAUNDERS MORRIS, M.E.

To the layman and to many engineers whose work has not led them to investigate electrical subjects, the electric motor is unknown in respect to its characteristics and its application to the work to be performed. That is, if the variations of torque and speed are known, it is in many cases possible to so design a motor that it will take care of these variations automatically. For instance, a motor may be so designed that with increasing load it will run with increasing speed, or that it will maintain a constant speed, or that it will decrease its speed as the load increases.

To many the motor is simply a machine for the conversion of energy, and in general, electric manufacturers are not sufficiently informed as to the conditions of torque and speed required. In many cases this lack of information comes from the fact that the motor is to be applied to an individual tool whose characteristics of torque and speed are not well-known—chiefly on account of the difficulty of making power measurements. Usually the manufacturer of the tool states that, say, a four-inch belt will drive it running at so many hundred feet per minute, and somebody is left to do the guessing. In a certain case which came under the writer's notice, a 10 hp. motor was specified for a tool. After the motors were installed it was found that they only required 3 hp. to run them, but it was stated that they required 10 hp. to start them.

A further investigation showed that these statements were based on current readings, the current when running being, say, 12 amperes at 220 volts, and when starting being, say, 40 amperes. The actual voltage on the motor was forgotten, but was probably not more than one-quarter of 220, and the actual horse power on the motor shaft was relatively small. To use the analogy of the steam engine, and suppose we had some instrument which we could put into the steam pipe to determine the steam consumption—if we assume that 20 pounds of steam per horse power per hour represents a fair consumption, would we be surprised if on starting we used six times as much per horse power, even with the cylinder hot? A steam engineer under these circumstances would not install a 15 hp. engine or even a 10.

Modern electric motors may be divided into two general classes—those operated by direct current and those by alternating currents. The subdivisions of direct current motors are in the main two only, viz., shunt, for constant speed, and series wound for variable speed. There may be, however, numerous combinations of the two types of field windings given, forming a very important sub-class called compound-wound motors.

Alternating motors of the polyphase type, whether for two-phase or three-phase, have the same general characteristics, the number of phases being taken care of in the design of the motor, as they do not materially affect the motor so far as its characteristics are concerned.

Polyphase, like direct current motors, may be divided into two general classes, namely, those for constant and those for variable speed. The range of speed in alternating motors is not as great as in direct current motors, for the reason that an alternating current mo-

tor will not run faster than synchronous speed, even when lightly loaded. By synchronous speed is meant the number of alternations of the circuit divided by the number of poles of the motor. In this sense, then, the alternating motor is not so flexible as the direct current motor. Alternating motors may be designed to run within 5 per cent. of synchronous speed, or by changing the proportions may be made to drop materially from synchronous speed.

Having now firmly fixed in our minds the idea that with direct current motors we should use a shunt-wound motor where constant speed and variable torque are required, and the series wound where the speed and torque are variable, let us see how this works in actual practice. Suppose, for instance, the motor is to be applied to some machine tool such as a lathe or boring mill—is a variable or constant speed motor required? The speed should manifestly be constant when referred to the load, i.e., should vary but slightly whether the load be thrown on or off, but should be variable at the will of the operator. Assuming, then, that the motor is coupled to a constant speed tool without the use of cone pulleys or other variable speed mechanism, the shunt-wound motor is the proper one to select, but the specifications should be drawn to provide for a change in speed of the motor over a given range. This adds to the expense of the motor over that of one running at a constant speed, and often unnecessarily so, on account of the uncertainty of the torque required, particularly at the lower speeds. For example, many engineers specify a 10 hp. motor having a range of speed of 400 to 800 r.p.m. The manufacturer is left to judge (and usually without knowing the use to be made of the motor) whether 10 hp. at 400 or at 800 r.p.m. if wanted, or both. If the motor should be applied to a lathe, for instance, it might be called on for 10 hp. at the slowest speed, say, on steel; and at the highest speed, say, on brass, only 5 hp. would be required. On the other hand, suppose the motor to be applied to a pump pumping against a constant pressure, it is then manifest that if the pump required 10 hp. when the motor was operating at 800 r.p.m., it would not require much more than 5 hp., when running at half speed. If the motor manufacturer furnishes a motor in this case capable of giving 10 hp. at 400, the expense is unnecessarily great and the pump is over-motored. Wide ranges of speed may be obtained from shunt-wound motors in various ways, such as, for instance, by supplying the armatures of the motors from two or more voltages, and in other ways also, but these are beyond the scope of this article.

Passing now to the series wound motor and disregarding its use for traction purposes, its chief use is for cranes and general hoisting work or work of a similar character, where this motor is always in the hands of an operator who can control its speed. The speed characteristic of the series-wound motor is almost the reverse of the shunt-wound—that is, when exerting its maximum torque its speed is least, and when the effort is least, its speed may reach a dangerous point.

There are cases where a series-wound motor may be used to good advantage where the motor is not under the constant control of the operator. One of these cases came to the writer's notice some time ago, and the sequel is instructive. A series-wound motor of 4 hp.

*From "Stevens Institute Indicator."

capacity was driving a punch. The selection of a series-wound motor of this capacity for the purpose was a good one as it started the punch with a less expenditure of current than a shunt-wound motor would have done, and when the punch was actually doing work and slowed down slightly, the increased torque was there to help the punch through. This motor was, however, wanted for something else and was taken off the punch. A much larger series-wound motor was however available, and as the small one had been doing so well, they assumed that the large one would do as well or better. When the punch had been started, the torque required was too little, the motor ran away and much time was spent in endeavoring to convince unwilling ears that the motor was not to blame.

Having now noted that the shunt-wound motor with a constant field gives us approximately a constant speed with variable torque, and that a series-wound motor with its field depending on the torque gives a variable speed, we may consider the combination of the two, i. e., the compound-wound motor. It should be noted here that to secure an absolutely constant speed the resultant field should remain constant, the torque varying. To do this, as the torque increases the field should be weakened either by throwing in resistance, or automatically, by taking a few turns of wire around the field in series with the armature, and so arranged that the current flows in the opposite direction to that in the shunt winding. The ordinary regulation of shunt motors is generally considered close enough for all general practice, but closer regulation may be secured if necessary, although with some objectionable electrical features.

The most important use of the compound-wound motor is where a very heavy starting torque is required and where close speed regulation is not demanded, or where occasionally heavy demands are made on the motor. As an example of the first case a pump might be cited, and as an example of the second case, punches, shears, or bending rolls might be mentioned. In these cases it is customary to give the motor just enough shunt winding to prevent its attaining a dangerous speed when the entire load is thrown off. In some cases a controller is furnished with a compound-wound motor which varies the number of series turns in the field. Such a motor can only be used where actual speed does not much matter, or where the torque required remains constant, as for rotating kilns for cement works.

For driving a pump, a compound motor possesses the desirable feature of giving a strong starting torque with the least draught of current on the system, and this is particularly true where there is a large amount of water, the inertia of which should be overcome slowly. Compound-wound motors offer a very attractive field for meeting varying speed conditions by inherent speed regulation, but some caution should be exercised in their use, and the speed and torque required at various loads should be accurately given.

Another method of securing efficient speed control is worth at least a passing reference on account of its importance in traction work, namely, the series parallel. For traction purposes this is accomplished by throwing, for slow speed, two motors or multiples of two motors, in series, and in parallel for high speeds. These are of course series wound mo-

tors, but the same thing may be accomplished with two shunt motors, except that in this case the armatures only are thrown in series, or an equivalent result may be attained by the use of one motor with two commutators and two armature windings.

Very often, especially on small motors, a great deal of money is spent in securing a wide variation of speed by means of field control, when this reduction in speed could be much more cheaply attained by means of a resistance in series with the armature, or a combination of both resistance and field control. This is especially true where the very slow speed is only occasionally required.

Had anyone made the statement, a few years ago, that an electric motor could be produced without any brushes on the revolving element or armature, he would have been looked upon with some suspicion, for many consider the commutator as an essential feature of a motor. To-day there are thousands of motors in use without commutator and without any current being supplied to the revolving element by means of brushes or other contacts. Such is the modern polyphase induction motor in which, as its name implies, the current is supplied to the revolving element purely by induction.

To many, an induction motor is a greater mystery than a direct current motor, and probably so on account of its simplicity of parts. Essentially it consists of one part, usually the stationary element or stator, into which the polyphase current is led, and the corresponding part, or the rotor, in which currents are induced which cause its rotation.

In the constant speed induction motor the resistance in the secondary element is made such that the drop in speed at full load is say 5 per cent. With overloads the speed drops proportionally until the maximum torque is reached and after this it drops rapidly and the torque decreases slightly also.

The greatest beauty of the polyphase induction motor is its simplicity of construction. The next advantage is the simplicity of starting. Any polyphase motor may be started by throwing into it the full potential of the circuit, such a procedure would result somewhat disastrously with most direct current motors, and would cause serious sparking with any. Throwing the full potential into the motor will result in quite a heavy starting torque, under ordinary conditions being from two to two and one-half times full load torque, which is of course greater than ordinarily required or desired. There are two methods usually employed for starting polyphase motors. Those with a fixed resistance in the secondary winding are started by applying to their terminals an electromotive force lower than normal, which is secured from two small transformers. As the motor comes up to speed the switch is thrown over, connecting the motor on the full potential for which it is designed. In motors with a variable resistance in the secondary, the full potential is thrown on the primary, but a resistance is inserted in the secondary winding, most of which is cut out as the motor comes up to speed. When running under normal conditions the performance of the two motors is practically identical.

In the same way that a direct current shunt-wound motor with constant field excitation tends to run at constant speed, so an alternating current motor also tends to run at constant speed, and as the field cannot be varied we

must vary some other element when we wish to vary the speed. The insertion of a fixed resistance in the secondary and the application of different electromotive forces will vary the speed, and the torque at the different electromotive forces will be proportional to the square of electromotive forces applied. For example, if the starting torque, that is, the torque at zero speed, be 100 pounds at 1 foot radius, with full EMF., at one-half full EMF. it will be 25 pounds.

Another method of regulation is to apply the full electromotive force, but to vary the resistance in the secondary. The motor characteristics in both cases are practically the same and are somewhat similar to those of a shunt-wound, direct current motor with resistance in series with the armature.

It has not, of course, been possible in an article of this length to indicate in more than a general way the type of motor which should be selected. In initial installations the consideration of alternating or direct current should be given careful thought. A large machine shop recently decided to install alternating motors on its tools at a considerable increase in cost over direct current motors (on account of the decreased cost of maintenance) and a large printing house put in direct current motors (because they would meet their requirements of fine speed adjustments better.)

In conclusion, the object of the writer has not been to analyze the various types of motors, but rather to make a plea for more definite information than is usually furnished to designers of electrical apparatus. To quote from Mr. Sydney F. Walker's article in the "Engineering Magazine": "An electric motor is as good-natured as most motors, but the user always suffers for over-working it, and the principal difference between it and steam or other engines in this respect is that the user generally suffers earlier with the electric motor than with others, which is, in many cases, to his ultimate advantage."

DEVELOPMENTS IN LONG-DISTANCE TRANSMISSION OF ELECTRICITY.*

The daily press tells of the successful test of street car operation in Oakland, Cal., on April 28, with electric energy generated at a point on the Yuba River, 140 miles distant. The energy is generated by water power and transmitted over a circuit composed of wires six-tenths of an inch in diameter, made of an alloy of copper and aluminum. The electrical pressure is 40,000 volts, and the loss in transmission is stated to be as low as 5 per cent.

This is by far the longest electrical transmission system for power purposes in existence, and if the loss is as small as it is stated to be it is the most promising indication of the possibilities of long-distance transmission yet furnished. Something like six years ago a test of electric transmission over a line between Frankfort and Lauffen, in Germany, a distance of 110 miles, was made for experimental purposes, but not until the test of the plant above referred to has transmission for commercial purposes over a line of such great length been a fact.

In the problem of long-distance electric transmission there are three cost factors which largely determine the economy of the scheme. These are: first, the cost of installing, oper-

*"Railway and Engineering Review."

ating and maintaining the power plant; second, the cost of transformation at the two ends of the line, including the installation and maintenance of step-up transformers at the generating end, to raise the voltage to that of economical transmission, and that of step-down transformers at the consuming end, to reduce the electrical pressure to a voltage suitable for use on commercial circuits; and third, the cost of constructing and maintaining the transmission line. Of these cost factors the first is perhaps the most uncertain. Nevertheless a careful investigation of the physical conditions to be encountered in the installation of a long-distance transmission system ought to yield estimates which closely approximate to the final cost.

In this connection it seems appropriate to remark upon some of the influences which determine the progress of electrical development, and particularly in respect to this matter of long-distance transmission. It usually occurs in the history of any science that invention and discovery precede actual development by a number of years. For instance, it was known for a number of years that machines could be constructed capable of generating energy on a large scale and at a pressure sufficient for transmission over a distance of 20 or 30 miles, within reasonable limits of cost of line construction and at a bearable loss of energy. It took time, however, to induce capital to invest in the Niagara transmission plant. The demonstration of the operation of that plant in running the street cars in Buffalo brought out no important electrical principles which had not been previously known. It did, however, give opportunity to perfect numerous minor appliances and methods of handling high-pressure electrical currents which had not been frequently afforded.

It is, of course, understood that the cost of line construction and loss of energy are reduced by increase of electrical pressure or voltage. For want of practical demonstrations on the magnitude of a commercial scale, however, there has always been some uncertainty as to the limiting voltage for which circuits could be insulated against extreme atmospheric conditions. For this reason nearly all of the high-voltage plants which have been installed up to this time have been limited to a working pressure of from 10,000 to 15,000 volts, or not greatly in excess of these figures. One exception is that in the case of the Niagara-Buffalo transmission, the voltage now being 22,000, having been recently increased from 11,000 volts, which was the original working line potential. The question of insulating for high voltage is, therefore, an important one in long distance transmission. The line pressure of the Oakland-Yuba plant is, therefore, greatly in excess of previous limits. Of course the atmospheric conditions in that part of the country are more favorable to insulation, but if no serious difficulties are encountered in working with the voltage adopted for this plant we apprehend that the pressure of high-voltage plants constructed in the future will be generally increased.

The progress of these advancements in electrical transmission thus depends more largely upon the question of enlisting capital in the construction of such systems than upon new inventions. Mechanical and electrical engineers are readily able to design machinery and to calculate the results to be obtained from the transmission of electricity at a certain

voltage over a line of calculated section, but the necessary initiative in all such advanced work is some assurance that an installation of the kind will effect some economy in cost of power. As industrial conditions are continually enforcing new economies capital is encouraged to take hold of untried schemes of plausible character, and it is this boldness of capitalists to invest in these schemes which shares the rewards with inventive genius.

LONDON NOTES.

(From our London Correspondent.)

Institution of Electrical Engineers.

On May 2d a paper was read by Mr. Frank Holden on "A Watt-Hour Meter." Mr. C. G. Lamb and Mr. Miles Walker followed with a description of an instrument for measuring the permeability of iron and steel. It has been designed to meet the demand for a simple, cheap and reliable piece of apparatus for the particular purpose. The authors tried to construct an instrument which would be extremely simple to use, and whose calibration should be dependent on such principles as should render it incapable of alteration with time and with somewhat careless usage. The principle adopted was that of balancing the reluctance of an air-gap against that of the specimen under test by means of altering the length of the air-gap. Since the reluctance of such an air-gap of given dimensions is invariable, the accuracy of an instrument based on this principle depends only on the accuracy with which the dimensions of the air-gap can be measured, and the delicacy with which the point of balance can be ascertained. The authors described the instrument used to fulfill these conditions. The manner of carrying out the calibration of the instrument was described.

100 vs. 200-volt Supply.

The Board of Trade has just issued its decision in regard to the power of electricity supply authorities to change over consumers' supply from low to high voltage, which it will be remembered formed the subject of a public inquiry in London. The new regulations are so worded as to indicate that companies are not to be handicapped by a few objecting consumers. It is further decided that if such consumers refuse their consent to change being made in the pressure, the companies may appeal to the Board of Trade who will overrule the objections if it thinks the circumstances warrant that course. The board may, if it so choose, relegate the matter to an arbitrator for settlement.

Montreal Men for Paris.

When Mr. Duncan McDonald late superintendent of the Montreal Electric Street Railway Company, was appointed manager of a tramway company in Paris, France, some months ago, he engaged several conductors and motormen from the Montreal street cars. He then received a great many applications from Montreal street railway men, but as it was impossible to accept them all he promised to endeavor to find work after a time for some of the rejected ones, and recently he engaged engineers Pare and Griffin of Montreal who will be inspectors for the Parisian company.

NATIONAL ELECTRIC LIGHT ASSOCIATION CONVENTION.

Secretary Porter says that all arrangements have been completed for holding the Twenty-fourth Convention of the National Electric Light Association at Niagara Falls on May 21, 22 and 23. The headquarters of the Association will be at the International Hotel.

Mr. C. O. Baker, Jr., Master of Transportation, has sent us the following: "It was stated in transportation notice sent out last week that extra cars would be attached to 8:30 A. M. train of the New York Central & Hudson River Railroad on Sunday and Monday. This is an error, as the 8:30 A. M. train does not run on Sunday, neither will extra cars be attached to this train on Monday (Empire State Express), but necessary extra cars will be attached to all other trains."

The following is the official programme of the Convention:

TUESDAY, MAY 21.

Meeting of the Executive Committee at 9 A. M. at the Secretary's office, International Hotel.

Morning Session, 10 o'clock.

At Convention Hall, International Hotel.

Address by President Cahoon.

Paper by C. R. Van Trump, Wilmington, Del., "A Station Load Diagram."

Afternoon Session, 2 o'clock.

Paper by Francis W. Willcox, Harrison, N. J., "The Practical Side of the Incandescent Lamp."

Report of Committee on Standard Candle-Power of Incandescent Lamps, Dr. Louis Bell, chairman.

Report of Committee on Amendments to Freight Classification of Electrical Apparatus, James I. Ayer, chairman.

WEDNESDAY, MAY 22.

Morning Session, 10 o'clock.

Paper by H. W. Hillman, Schenectady, N. Y., "Arc Lighting at the Beginning of the Twentieth Century."

Report of Committee on Photometric Value of Arc Lamps, Henry L. Doherty, chairman.

Afternoon Session, 2:30 o'clock.

Paper by Louis R. Wallis, Woburn, Mass., "The Foresee (4-C) System of Charging."

Report of Committee on Uniform Accounting, G. E. Tripp, chairman.

Report of Committee on Analysis of Flue Gases, Henry L. Doherty, chairman.

Executive session.

Report of Committee on Legislative Policy, Samuel Insull, chairman.

THURSDAY, MAY 23.

Morning Session, 10 o'clock.

Paper by Augustus Treadwell, Jr., New York City, "Storage Batteries in Central Station Work."

Report of Committee on Rules for Electrical Construction and Operation, Capt. William Brophy, chairman.

Topic: "Steam Heating from Central Stations."

Afternoon Session, 2:30 o'clock.

Paper by Calvin W. Rice, New York City, "Distribution of Current at High Potential in New York City."

Report of Committee on Amendments to By-Laws, Samuel Insull, chairman.

Executive session.

Reports of Secretary and Treasurer and Executive Committee.

Election of officers.

INSIGNIA.

Officers, red bow.

Executive Committee, blue bow.

Active Members, brown ribbon.

Associate Members, turquoise blue ribbon.

Reception, yellow ribbon.

Guests, rose ribbon.

Honorary members, white ribbon.

Press, olive green ribbon.

New York Electrical Society.

The 215th meeting of the Society will be held at the College of the City of New York, Lexington avenue and 23d street, Thursday, May 16, at 8 p.m. Dr. W. E. Geyer, of Stevens Institute of Technology, Hoboken, will lecture on "Inductance." This interesting lecture will be entirely non-mathematical. The nature of inductance will be explained by many striking experiments, the desired effects being made apparent to the eye by using incandescent lamps as ammeters and voltmeters. The following are some of the points that will be illustrated: Gradual rise and fall of current—Choking effect—Lag—Inductance affected by form of circuit—Circuit changing its form to make the inductance a maximum—Energy stored in circuit—Inductance balanced by capacity in series and in parallel.

Moved into More Commodious Quarters.

The Shelby Electric Company has moved its New York office from 141 Broadway to larger and more elaborate offices in the Parker Building, 4th avenue and 19th street. Mr. James C. Wormley, Eastern manager of the company, reports a very large business for the past year. He says the company is having a lamp testing laboratory for any make of lamp put in at a great deal of expense and which will be open to all visitors. The Shelby Company also proposes carrying a complete stock of 50,000 lamps.

Exports of Electrical Material from New York.

The following are the exports of electrical material, from the port of New York, for the week ended May 8:

Antwerp, 20 packages, \$399; Argentine Republic, 18 packages, \$309; Australia, 51 packages, \$6,534; Berlin, 60 cases, \$3,654; Brazil, 2 packages, \$26; Bremen, 7 cases, \$324; British Guiana, 12 packages, \$316; British West Indies, 40 packages, \$877; 4 cases, \$375; British Possessions in Africa, 151 packages, \$12,667; British East Indies, 12 packages, \$1,105; Central America, 77 packages, \$1,271; China, 6 packages, \$270; Cuba, 170 cases, \$2,787; Genoa, 1 case, \$10; 8 packages, \$185; Glasgow, 123 packages, \$6,928; Hamburg, 71 packages, \$3,158; Havre 67 packages, \$4,639; Japan, 116 cases, \$29,486; Leicester, 2 packages, \$50; Lisbon, 11 packages, \$208; Liverpool, 164 packages, \$6,183; London, 31 packages, \$7,783; 16 cases, \$914; Marseilles, 75 cases, \$800; Mexico, 404 cases, \$10,108; Milan, 3 cases, \$100; Naples, 10 packages, \$65; Peru, 2,300 packages, \$17,715; Preston, 2 cases, \$40; Philippines, 117 packages, \$6,780; 1 case, \$30; Santander, 5 cases, \$151; Santo Domingo, 4 cases, \$35; Southampton, 64 cases, \$6,944; Sucz, 1 coil cable, \$834; St. Petersburg, 6 packages, \$326; U. S. Colombia, 11 packages, \$45; Venezuela, 26 packages, \$405.

PERSONAL MENTION.

Mr. Andrew Hickenloper was recently elected president of the Cincinnati Gas & Electric Company.

Mr. William A. Marshall has accepted the position of secretary and manager of the Orange County Telephone Company in Middletown, N. Y.

INCORPORATIONS.

The Electric Motor & Generator Ventilating Company Wilmington, Del. Capital stock, \$100,000.

The Compton Land, Water & Electric Company, Los Angeles, Cal. Capital stock, \$500,000. Incorporators: J. R. Compton, G. W. Cox and G. D. Sanford.

The Electric & Steam Railway Supply Company, Lafayette, Ind. Capital stock, \$5,000. Directors: Francis W. Powers, Martin L. Snyder, William W. Hoffman and Scott Shobe.

The Royal Electric Light Company, Royal Center, Ind. Capital stock, \$10,000. Directors: Ernest B. Thomas, John J. Schmidt, Waterman G. Sweet, William H. Bingaman and James L. Thomas.

The Robinson Water, Light & Heat Company, Robinson, Ill.—to operate electric light, heat and power plants. Capital stock, \$70,000. Incorporators: C. S. Jones, F. Bartmes and A. H. Bayston.

The Rome Gas, Electric Light & Power Company, Rome, N. Y. Capital stock, \$400,000. Directors: James T. Lynn of Detroit, Martin B. Daly of Toledo, O., and John D. McMahon and others of Rome.

The Pan-American Motor Company, Trenton, N. J. Capital stock, \$100,000. Incorporators: A. T. Thompson, J. F. Fox and H. G. Derby of New York, H. W. Whipple and W. M. Power, both of New Jersey.

The North Coast Electric Company, Everett, Wash.—to conduct a general electric construction business and to string wires for the purpose of conducting a messenger service such as is used in all large cities.

The Paris Transit, Light & Power Company, Paris, Tex. to operate a street railway and to supply gas and electricity. Capital stock, \$250,000. Incorporators: W. F. Little, R. H. Correll of St. Louis, W. F. Dulaney, R. W. Wortbam and S. M. B. Long, all of Paris.

The Akouphone Company, New York City to manufacture instruments to enable the deaf to hear and the dumb to speak. Capital stock, \$700,000. Directors: Benjamin H. Adams, Herbert W. Grindal, Henry D. McGowan, Charles W. King and David U. Jennings, New York City.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED MAY 7, 1901.

ELECTRIC RAILWAYS AND APPLIANCES.

673,441. Trolley-Base. Frank A. Merrick and Frank W. Garrett, Johnstown, Pa., assignors to the Lorain Steel Company of Pennsylvania. Filed Aug. 16, 1900.

673,531. Electric-Railway Controller. Edward M. Bentley, Lawrence, N. Y., assignor to the General Electric Company, Schenectady, N. Y. Filed June 17, 1899.

673,538. Electric-Railway Conduit. Frank Hewer, Chiswick, Eng. Filed June 12, 1900.

673,660. Rail-Bond. William T. Pringle, Lansdowne, Pa. Filed Jan. 15, 1901.

673,735. Street Car Fender. Arthur L. Siegel and James St. J. Lambe, St. Louis, Mo., assignors of one-third to Frank Gaennle, same place. Filed Feb. 2, 1901.

673,765. Telltale for Rail-Bonds. James A. Emery, Atlanta, Ga. Filed Oct. 4, 1900.

673,766. Overhead Trolley. Henry C. Eno, Pittsfield, Mass., assignor of one-fourth to George H. Russell, same place. Filed July 7, 1900.

ELECTRIC LIGHTS AND APPLIANCES.

673,394. Incandescent-Mantle Support. Max Herskovitz and Abraham L. Herskovitz, Chicago, Ill. Filed July 23, 1900.

673,563. Safety-Catch for Incandescent Electric Lamps. George B. Millen, San Francisco, Cal. Filed July 14, 1900.

673,713. Spark-Discharging Device for Electric Lighting for Gas-Burners. Paul Hoffmann, Charlottenburg, Germany. Filed March 24, 1900.

ELECTRICAL MACHINERY AND APPARATUS.

673,405. Machine for Cutting Fabrics. Henry A. Meyer, Cincinnati, O., assignor to the Wolf Electrical Promoting Company, same place. Filed Sept. 22, 1900.

673,565. Electric Controller. William Morrison, Chicago, Ill., assignor to the Helios-Upton Company, same place. Filed June 18, 1900.

673,567. Electric Transformer. Louis M. Pignolet, Orange, N. J. Filed Sept. 10, 1898.

673,624. Electromagnet and Annunciator. Charles E. Scribner, Chicago, and Frank R. McBerty, Downer's Grove, Ill., assignors to the Western Electric Company Chicago, Ill. Filed April 6, 1893.

673,694. Machinery for Covering Electrical or other Wires for Insulating Purposes. Walter W. Colley, London, Eng. Filed June 4, 1900.

673,709. Lathe. Frederick B. Duncan, Madison, Wis., assignor to the Northern Electrical Manufacturing Company, same place. Filed Aug. 10, 1900.

673,731. Electric-Motor Controller. Oscar F. Shepard, Jr., Madeira, O., assignor to the Warner Elevator Manufacturing Company, Cincinnati, O. Filed Oct. 3, 1900.

673,807. Controller for Rotary Transformers. Thomas S. Watson, Milwaukee, Wis. Filed June 4, 1900.

TELEPHONES AND TELEPHONE APPARATUS.

673,376. Electrical Signaling System. Harry R. Bennett, San Francisco, Cal. Filed Aug. 9, 1900.

673,504. Telephone-Switchboard. Isidor J. Kusel, Chicago, Ill., assignor to the Eureka Electric Company, same place. Filed Sept. 27, 1900.

673,512. Microtelephonic Apparatus. Jacob Berliner, Hanover, Germany. Filed Dec. 4, 1900.

673,794. Electric Signal and Telephone System. Charles L. Fortier, Milwaukee, Wis., assignor of one half to Alfred Weller, same place. Filed June 12, 1899.

673,795. Telephone-Service Apparatus. Uriah S. Jackson, Ossipee, N. H. Filed Nov. 22, 1900.

MISCELLANEOUS.

673,381. Printing-Telegraph Instrument. Louis M. Casella, London, Eng. Filed Aug. 10, 1900.

673,391. Current-Regulator. James P. Erie, New York City, assignor to the Erie Exploration Company, same place and Dover, Del. Filed Jan. 4, 1901.

673,392. Rheostatic Support. James P. Erie, New York City, assignor to the Erie Exploration Company, same place and Dover, Del. Filed Sept. 13, 1900.

673,396. Horn or Trumpet for Phonographs. George L. Hogan, New York City. Filed May 28, 1900.

673,413. Multiple Phonogram or Record Holder. William T. Baker and Benjamin F. Clayton, Louisville, Ky. Filed June 21, 1900.

673,418 673,553. Apparatus for Use in Wireless Telegraphy. John Barry, Fort Lee, N. J. Filed Sept. 2-9, 1899.

673,428. Current-Regulator. James P. Erie, New York City, assignor to the Erie Exploration Company, same place and Dover, Del. Filed Sept. 17, 1900.

673,449. Telegraph-Key. Frank J. Raab, Toledo, O. Filed June 14, 1900.

673,452. Electrolytic Apparatus. Isaiah L. Roberts, Brooklyn, N. Y., assignor to the Roberts Chemical Company of New Jersey. Filed Jan. 21, 1899.

673,453. Connector for Electrodes. Isaiah L. Roberts, Brooklyn, N. Y., assignor to the Roberts Chemical Company of New Jersey. Filed June 25, 1895.

673,476. Device Employing Electric Resistance. Conway Robinson, Elwood, Ind. Filed March 15, 1900.

673,519. Multiple Telegraph. Samuel T. Foster, Jr., Laredo, Tex. Filed March 14, 1899.

673,521. Manufacture of Solenoid or other Electric Coils. John A. Heany, Philadelphia, Pa., assignor to the Teter Heany Developing Company, same place and Charleston, W. Va. Filed Feb. 18, 1901.

673,619. Motor Vehicle. Elwood Haynes and Elmer Apperson, Kokomo, Ind. Filed July 13, 1900.

673,643. Power-Transmission Device. Harry A. Knox, Springfield, Mass. Filed Oct. 5, 1900.

673,652. Storage Battery Cell. Jacob C. Chamberlain, New York, and Henry R. Sutphen, Hightbridge, N. Y. Original application filed Sept. 11, 1899. Divided and this application filed Nov. 9, 1900.

673,656. Bushing for Electrical Outlet-Boxes. Hubert Krantz, Brooklyn, N. Y. Filed Feb. 9, 1901.

673,678. Storage Battery. Jacob C. Chamberlain, New York, and Henry R. Sutphen, Hightbridge, N. Y. Filed Sept. 11, 1899.

673,710. Terminal and Binding-Screw for Electric Batteries and Connections. William R. Edwards, Weybridge, Eng. Filed Nov. 2, 1900.

673,734. Process of Electrolytic Decomposition. George Bell and George W. Bell, Liverpool, Eng. Filed June 7, 1898.

673,761. Process of Reducing Sodium Compounds. Alfred H. Cowles, Cleveland, O., assignor to the Electric Smelting & Aluminum Company of Illinois. Filed July 20, 1895.

673,792. Storage Battery. David W. Beebout, Pittsburg, Pa. Filed Feb. 19, 1900.

DESIGN.

442. Telephone-Supporting Bracket. Ray V. Griggs, Chicago, Ill. Filed March 25, 1901. Term of patent years.

THE TELEPHONE WORLD.

New York's Increase in Telephones.

New York has become by far the greatest telephone city in the world, Berlin being second and London third. The rapid increase in the use of the telephone in this city has been due to the extraordinary activity both in commercial and financial circles, especially in the Wall Street district.

In the last three years the increase in the number of stations in this city has been 30,000, the gain for each year large, exceeding that of the previous year. In 1898-1899 the gain was more than 8,000 stations; in 1899-1900, more than 12,000 stations and in the twelve months ending April 30 the gain has been more than 15,000 stations.

Worcester, Mass., is to be made a link in a wireless telephone and telegraph system extending from Boston to New York and already men have been in that city looking over the ground. The line is to be built by the New England Wireless Telegraph & Telephone Company with headquarters in Boston. The instruments for the establishment of the line are now being made in Boston and the books of the company have been opened for subscriptions. The company is a licensee of the American Wireless Telegraph & Telephone Company and \$1,250,000 of the stock of the New England Company is to be placed in the treasury of the parent company. The president of the New England Company is J. H. Huston, and the office of the company has been established in the Boylston Building, Boston.

The Pennsylvania Telephone Company is making a number of important improvements to its line in Steelton. At many points new poles are being planted and on some of the streets the line is being extended. The new poles erected are very heavy, and much higher than the old ones. During the past month nearly thirty new 'phones have been placed in Steelton business houses and private residences.

A local telephone exchange in connection with the long-distance system of the Central New York Telephone & Telegraph Company has been installed in Morrisville in this State. The number of subscribers is limited, but it is expected that there will be more as soon as the service is in good working order and its convenience is appreciated.

The directors of the Iron Range & Electric Telephone Company, capitalized at \$50,000, with headquarters at Wadena, Minn., have filed articles of incorporation with the Secretary of State. The officers are: A. B. Kerlin of Park Rapids, president; W. R. Baumbach of Park Rapids, vice-president and treasurer; C. W. Baumbach secretary.

The telephone line from Rosenberg to Damon's Mound, Tex., is now an assured fact. It is proposed for this line to extend to Damon on the south and Richmond on the east, and with the improvement that is now going on at Damon it will fill a much needed want.

The annual report of the New England Telephone & Telegraph Company for the year ended December 31, 1900, compares as follows: 1900—Gross earnings, \$4,518,396, increase over 1899, \$572,042; operating expenses, \$3,621,644; increase, \$138,842. Net earnings, \$896,752; increase, \$113,200.

The Independent Telephone Company, which was organized in Liberty, Neb., some time ago, has proven a success. Seventy-five shares have been sold, and forty miles of line are under construction. Over one-half of the shares have been sold to farmers.

The Weston, O., Mutual Telephone Company has been formed with the following officers: President, I. B. Ballmer, secretary, G. W. Smith; treasurer, Ed. Guyer; directors: J. E. Clark, Milton Brundage and L. H. Sheley.

The Citizens' Telephone Company of St. Johnsbury, Vt., has begun the work of continuing its lines towards Wells River. The construction of a line to the eastern towns will be commenced at an early date.

The plant of the Standard Telephone Company in Madison, Wis., was practically destroyed by fire a short time ago. Loss on stock amounts to \$10,000; on building, \$1,000; fully insured.

An independent company will put in a telephone exchange at Hutchinson, Kan., this summer. A franchise has been granted to Messrs. Bellamy and Burns.

The Union Telephone Company at Alma, Mich., has added 50 new 'phones to its exchange. It is also enlarging its plant by putting in new switchboards and higher poles.

Extending and Improving Its System.

The Citizens' Telephone Company of Grand Rapids, Mich., is planning large extensions to its local service this summer, and also for many new State lines. The city improvements will consist chiefly in placing several hundred more copper wire long distance conduits. Before June 1, 400 more will be placed there and several others will follow before snow flies again, in addition to extending the local service by means of poles into portions of the city never before reached by telephone.

In the State one of the most important lines to be built is from Hastings to Lowell, by way of Clarksville, Freeport, Elmdale and Alto. This is already under way. A line of 40 or 50 new farm telephones has been added to the Vermontville exchange.

A copper wire circuit will be completed as far north as Manton before August 1. It is now completed as far as Big Rapids. An exchange at Luther has just been installed and a line is being built from Hersey to Everett. In operating these lines, the company co-operates on the most intimate terms with the Union Telephone Company, an independent concern owning lines throughout the central part of the State and running as far east as Saginaw. It is capitalized at \$150,000, and has its headquarters at St. Johns.

Another copper wire circuit is being built to Muskegon via Grand Haven. Connections with Detroit by way of the long-distance lines of the Everett-Moore syndicate, which is building the new exchange there, will be established some time during the summer.

The Southern Bell Telephone & Telegraph Company is making extensive improvements in its long distance service. Two additional copper circuits are being constructed between Macon and Atlanta, Ga., and when completed the total number of copper circuits between these cities will be four, and another circuit is being placed between Macon, Albany, Americus and Thomasville. Another circuit is being erected between Atlanta and Chattanooga, and when this is completed a through line will be open to New York by the way of Charlotte, Richmond and Washington. The building of this line will give more direct service between these cities.

A meeting of the stockholders of the Automatic Telephone Company of Waterbury, Conn., has been called for the purpose of winding up its affairs. The company, which held valuable concessions from the city but has never built a plant, has decided to give up its organization on account of the refusal of the State Legislature to repeal the clause of the general telephone law which compels new companies to receive the sanction of the courts on the ground of public necessity and convenience. On the same ground a number of other independent telephone companies in Connecticut will dissolve.

A telephone line is being constructed between Moulton and Hillsboro, Ala. Moulton is 14 miles off the railroad and this telephone line will be of inestimable value to those living in the lower valley. It is stated upon good authority that the gap in the long distance telephone line between Leighton on the west and Hillsboro on the east, a distance of 20 miles, will be filled in very soon.

The Michigan Telephone Company of Detroit reports a net gain of 599 subscribers in April, making a total number of 47,202 subscribers on April 30. The Erie Telephone system, of which this company is a part, reports a net gain of 1,961 subscribers in April, and a gain of 4,981 since January 1, making a total number of 146,580 subscribers on April 30.

The Troy, N. Y., Telephone & Telegraph Company will soon have a new home. The old building will be abandoned, and the new building will be converted into a modern exchange. Among the many improvements to be made will be the insertion of a new switchboard.

The Twin City Telephone Company is receiving bids for the erection of its new West Minneapolis, Minn., exchange building, which is to cost something over \$7,000, and will be completed within sixty days of the letting of the contract.

Edward DeLong has received the contract for 900 poles from the Schuylkill Telephone & Telegraph Company. They will be used on the new line between Reading and Allentown, Pa., and must be delivered by July 1.

The La Crosse, Wis., Telephone Company is building a large addition to its establishment to be used as a mechanical shop. Many improvements are also being made in the old part.

Nelson, Neb., is making an effort to secure telephone connection with the outside world.

Telephoning in Germany.

United States Consul Brainard H. Warner, Jr., stationed at Leipzig, Germany, has informed the State Department that the long-distance telephone line connecting the cities of central Germany with Frankfurt, Kalk, Muhlheim, Cassel and Wiesbaden, in the western part of the empire, has been opened to the use of the general public. The charge for using this line is 1 mark, or nearly 24 cents, for every three minutes of conversation to any one of the above mentioned places.

D. McReynolds, district superintendent of the construction department of the Southwestern Telegraph & Telephone Company, has lately been in Galveston, Tex., looking after the work of putting in the underground system there that is now in progress. He says that the work has proceeded satisfactorily so far. Mr. McReynolds estimates the cost of putting in the underground system together with that of the drainage system necessary to maintain it at \$95,000.

Wireless telephone messages were recently sent across the Mississippi, a distance of 1,000 feet. The apparatus consisted of 150 feet of copper wire on each bank, strung parallel to the river, and connected to transmitters, receivers and batteries. The first experiment was made with an electric current of five volts, and while the messages could be heard the words could not be made out. Other batteries were then attached, and with twenty volts at the sending end of the line and five at the receiving end the words could be heard as well as if sent by an ordinary telephone.

The Northwestern Telephone Exchange of St. Paul, Minn., reports a net gain of \$33 subscribers in April, making a total number of 22,512 subscribers on April 30. The Erie Telephone system, of which this company is a part, reports a net gain of 1,961 subscribers in April, and a gain of 4,981 since January 1, making a total number of 146,580 subscribers on April 30.

The Rural Telephone Company of Humboldt, Neb., and Spieser townships, has completed organization and sold the bulk of the shares. Construction work has begun and before many weeks connection will be made with the local city exchange and toll lines. The Rural system covers quite an area and will no doubt be a great advantage to the farmers.

The People's Telephone Company of Superior, Wis., has received a carload of new cables for use in the extension of the lines of the company in different parts of that city. A large number of new telephones have been put in by the company of late and especially since the railroads were all connected with the new company 'phones.

The license board of Bangor, Me., held its annual meeting, and the petition of the New England Telegraph & Telephone Company for the right to place its wires underground was presented. After considering the request very carefully the board decided that it would not be advantageous to the city to grant the company the desired permission.

The Perkiomen Telephone Company will shortly erect poles and string wires. The line will be extended to Hillegas and Red Hill, Pa.

A rural telephone line is being built from Atchison to Doniphan, Kan., a distance of about seven miles.

TELEPHONE INCORPORATIONS.

The Citizens' Telephone Company, Toronto, O. Capital stock, \$10,000.

The Adair Telephone Company, Adair, Ia. Capital stock, \$10,000. Incorporators: L. H. Paine and others.

The Batavia Home Telephone Company, Batavia, N. Y. Capital stock, \$160,000. Directors: S. B. Rawson, J. H. Griswold and A. E. Lord, Elyria, O.

The Richardson Telephone Company, Richardson, Tex. Capital stock, \$750. Incorporators: C. H. Blewett, W. N. Stults, C. C. Huffines and others.

The Union Telephone Company, Cedar, Ia. Capital stock, \$10,000. Incorporators: C. Bradley, William Abegg, R. E. Holloway, J. V. Garvin, James L. Moore, A. J. Fairchilds, Moses Picken, R. J. Woody and C. A. Moore.

The Saratoga Telephone & Telegraph Company, Saratoga Springs, N. Y.—to operate in Saratoga Springs, Ballston Spa, Mechanicsville, Stillwater, Waterford, Troy, Schuylerville, Glens Falls, Schenectady and in the various cities, towns and villages of Saratoga, Fulton, Warren and Schenectady Counties. Capital stock, \$125,000. Directors: F. K. H. Beach, Stephen C. Medbery, I. W. Wiswall and Herbert C. Westcott, of Ballston Spa, and Charles W. Coal, W. L. Burke and William P. Burtley of Glens Falls.

GENERAL ELECTRICAL NEWS.

Lighting.

Baker City, Ore.—This city has voted to bond itself for the purpose of erecting a municipal electric light plant.

Bristol, Tenn.—A. S. McNeil and J. F. Hicks will organize a company to build an electric light plant.

Brownsville, Ore.—W. C. Peterson is figuring on putting in an electric light system here.

Charlotte, N. C.—F. F. Van Deventer and associates of Knoxville, Tenn., have applied for a franchise to construct a water power electrical plant.

Chillicothe, Mo.—Chillicothe has voted to issue \$25,000 in bonds to build a municipal electric light plant.

Clarksville, Ia.—The question of erecting an electric light plant is being agitated here.

Columbus, Miss.—The Columbus Light & Power Company will remodel its two plants this summer, installing a new and larger electric equipment.

Columbus, O.—The Cincinnati Gas Light & Coke Company has increased its capital stock from \$9,280,000 to \$28,280,000, in accordance with a consolidation effected recently at Cincinnati, and then changed the name to the Cincinnati Gas & Electric Company.

Covington, Ga.—At an election held recently Covington voted for bonds for the purpose of establishing electric lights.

Dunlap, Ia.—The question of erecting an electric light plant here is being agitated by the people.

Ellsworth, Wis.—The village board has leased a space on the village lot to Willy & Buck of Elroy, Wis., for a term of 99 years to be used only for a city electric light plant.

Greenville, N. C.—This city has appointed J. L. Ludlow of Winston as engineer to prepare plans for the electric light plant, etc.

Havre, Mont.—The citizens have voted to issue bonds to build an electric light plant.

Independence, Kan.—The Independence Electric Street Railway Company has made application to the city council for a franchise for an electric light plant for this city.

Kissimmee, Fla.—This city will soon erect an electric light plant.

La Claire, Ia.—Steps are being taken here to establish an electric light plant. Capt. Orin Smith and H. A. Horton are said to be pushing the scheme and much encouragement is being given.

Lincoln, Ill.—A Chicago light company has made an offer to the city council to construct a municipal electric light plant to cost about \$30,000. The proposition is now under consideration.

Lowell, Mass.—The city council is considering the question of erecting a municipal electric lighting plant.

Mayfield, Ky.—The Graves County Water & Light Company of this place has decided to erect a new electric light plant.

Montreal, Can.—Bids will be received until June 15 at the office of L. O. David, city clerk, for installing and maintaining electric arc and other electric lamps for lighting the streets, highways, etc., in this city.

Oakdale, N. Y.—W. K. Aston's property at this place was lately sold to Mr. Plympton, who proposes to make many improvements, including an electric plant, new inland waterways, floating gardens, a boulevard on the shorefront and artistic bridges.

Oakland, Cal.—The citizens are agitating the question of erecting a municipal electric lighting plant.

Orlando, Fla.—This city will grant a franchise for an electric light plant. Bids are solicited. Address J. Duke, city clerk.

Ottawa, Baach, Mich.—A new electric light plant will be built here this summer to take the place of the present equipment and will be built on the shore of Black Lake near the old plant.

Park River, N. D.—This city is figuring on putting in a modern electric light system.

Parsons, W. Va.—H. K. Grib has asked for a franchise to erect an electric light plant here.

Richfield, Utah.—The question of erecting an electric light plant in Richfield is being agitated.

Richmond, Ky.—The Richmond Water & Light Company, which has a \$10,000 water and gas plant here, will shortly begin the erection of an electric light plant costing \$16,000.

Salt Lake City, Utah.—E. W. Hammer, of the Utah Home Telephone Company, will ask this city to grant his company an electric light franchise.

Silver Creek, N. Y.—This place is to have an up-to-date electric light plant.

Toluca, Ill.—The Toluca Electric Light & Gas Company was incorporated for \$15,000 by C. H. Devlin, H. Duggan and D. M. Wood.

Warrenton, Va.—G. B. Stone and F. D. Gaskins of this place have been inspecting the electric and ice plants in Lynchburg, with a view to establishing similar plants here.

Woodland, Cal.—J. Martin, the San Francisco capitalist, has purchased the Woodland electric and gas plants and will make extensive extensions and improvements amounting to \$20,000.

Woodstock, Va.—The town council has granted a franchise to the Woodstock Electric Light Company, and electric lights are assured.

Street Railways.

Albany, N. Y.—The Westchester Electric Railroad Company has filed with the Secretary of State a certificate of extension of its route in New Rochelle.

Baltimore, Md.—The Baltimore & Washington Electric Railway Company, with a capital of \$1,500,000, was organized here last week to build a trolley road between this city and the national capital with a branch to Annapolis.

Charleston, Ill.—The electric street railway between this city and Mattoon will soon be built. The directors have decided to increase the capital stock from \$125,000 to \$200,000. The Charleston-Mattoon line will be 12 miles long. F. Bolton of Huntington, Va., is president of the company. C. Fairbanks of Terre Haute, and M. R. Williams of Indianapolis are also interested.

Kenosha, Wis.—P. J. Haynes and G. L. Claussen of Chicago have secured a right of way for the building of an electric railway from this city to the junction of the Chicago, Milwaukee & St. Paul Railway at Truesdell.

Las Vegas, N. M.—The Las Vegas & Hot Springs Electric Railway Light & Power Company has been incorporated for \$200,000 by J. E. Merryman, V. O. Saunders and G. W. Baumhoff. The purpose of the company is the construction of a street railway and electric light plant at this place and neighboring towns.

Romeo, Mich.—The council has granted a franchise to the Detroit, Utica & Romeo Electric Railway Company. The road will be 8 miles long.

Schenectady, N. Y.—The Schenectady Street Railway Company contemplates the building of a trolley line from this city to Troy going by way of the Troy turnpike.

San Francisco, Cal.—It is reported here that Capt. Delamar, the owner of the Bully Hill copper mines, in Shasta County, has offered to buy the famous Balaklava copper property, near his present holdings. If the deal goes through the captain contemplates the construction of an electric railway between the properties connecting with a point near the junction of Sacramento and Pitt Rivers.

Toledo, O.—The Toledo-Bryan Air Line Company of this city was lately incorporated with \$1,250,000 by J. L. Yost, F. V. H. Collins, W. C. Brewer and M. Taylor. The company will construct an electric railway from Bryan through Williams, Fulton and Lucas counties to this city.

Tomahawk, Wis.—The Wisconsin River Electric Railway Company has been incorporated to build an electric line from here to Stevens Point and Grand Rapids.

Warren, O.—Manager A. A. Anderson of the Trumbull Electric Railway will ask a 50-year franchise for a single track line between this city and Leavittsburg.

Manufacturing.

Boston, Mass.—The Electric Manufacturing Company has been incorporated under the laws of this State, with a capital of \$650,000, to manufacture and sell electricity for mechanical power in this city, and to manufacture storage batteries. John A. Haskell, G. H. Butters, Wallace B. Donham, James Dean and Frederick Carls are the shareholders.

Chicago.—Homer H. Peters, Henry A. Thexton and Joseph L. Harrington are interested in a \$2,000 concern known as the Thexton Electric Envelope Sealer Company, which will manufacture novelties.

Hartford, Conn.—It is rumored that the Perkins Electric Switch Manufacturing Company of this city is to move its works to Bridgeport, with the Bryant Electric Company of that city, with which it is closely associated.

Middletown, Conn.—It is reported here that R. M. Keating has purchased the factory formerly occupied by the Mills Bell Company. It is said that Mr. Keating will manufacture electric machinery for purposes where a small power is desired.

Trenton, N. J.—The Wheeler Electric & Manufacturing Company, capitalized at \$100,000, has been formed by Wm. M. Pawley of New Jersey and Daniels & Co. of New York. The Delaval Steam Turbine Company, with a capital of \$1,000,000, was incorporated here last week to manufacture steam turbines, dynamos and other electrical apparatus.

West Chester, Pa.—Philadelphia is soon to lose the Sun Electric Appliance Manufacturing Company, which is to be located here.

Company Matters.

Gilsum, N. H.—The directors of the Keene, Marlow & Newport Electric Railway Company held an adjourned meeting here a short time ago at which by-laws were adopted and officers were elected as follows: President, Elgin A. Jones, of Marlow; vice-president, Frank E. Nesmith, of Surry; clerk, John A. Smith, and treasurer, Israel A. Loveland of this place.

Power and Transmission.

Cumberland, Md.—The Great Falls Water Company has offered the trustees now operating the Chesapeake & Ohio Canal \$75,000 for the use of certain water rights along the Great Falls. The State board of public works asked that the right be held off, as an opposing company would give \$100,000 for it. It is the plan of the latter company to erect a steel dam across these waters for the purpose of generating electricity. This is to be carried to Washington and other points. The plan is to generate at least 10,000 horse power, and the works will cost from \$1,500,000 to \$2,000,000. The syndicate is headed by James F. McLaughlin, of Toronto, Can.

Mines.

Redding, Cal.—The smelting plant of the Mountain Copper Company at Keswick is to be operated wholly in the near future with electrical power. It is hoped to supply not only the other big mines of the county with electrical power and light, but the cities of Redding, Red Bluff, Cottonwood and Anderson as well.

Automobiles.

Ashland, O.—H. K. Clover and E. O. Flanders, who operated the automobile works at Anderson, Ind., are interested in a similar project here.

Niles, O.—A recent report claims that this city wants to secure the plant of the Akron Motor Carriage Company. W. A. Fritchard, L. Holloway, Wade A. Taylor, I. Baldwin and F. B. Harris, members of the Niles board of trade, have been conferring with the officials of the Akron Motor Carriage Company.

Utica, N. Y.—It is stated that the Remington Automobile Company has begun the removal of the machinery from Ilion to this city. The launch department of the business promises to be an important branch.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by ELECTRICITY from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

Quoted (Memor.)						

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16½¢@16¾¢; Lake, 17½¢@17¾¢; casting, 16½¢@16¾¢.

A new Woods Vehicle Company, capital \$1,500,000, has been incorporated under New Jersey laws.

As a result of Thursday's panic, eleven New York Consolidated Stock Exchange firms were compelled to suspend.

The stockholders of the Havana Electric Railway Company have voted to increase the common stock from \$10,000,000 to \$11,000,000.

The governing committee of the New York Stock Exchange has listed the General Electric Company's \$2,551,200 additional common stock.

United Railways of St. Louis preferred made a good net gain on Monday. It closed at 77½ bid, as compared with 70 bid at the close on Friday.

The Fulton and Oswego electric light and power plants of Oswego, N. Y., have been sold for \$65,000 to Street, Fykes & Co., brokers, of New York City.

The "Baltimore Manufacturers' Record" estimates that nearly 200 miles of trolley lines are planned to be built in the South in the near future or are actually under construction.

The employees of the United Traction Company of Albany, N. Y., have rejected a proposition of the company and of the National Board of the Amalgamated Union to arbitrate differences, and the strike is still on.

The work of burying the wires of the United States Electric Company, of Newark, N. J., which controls practically all the public lighting and power in that city, begins to-day with the laying of conduits in Broad street.

Copper during the past week was quiet, with producers still holding at the previous quotations. The export business shows some improvement over the previous month, although it shows a considerable falling off from last year's figures.

The Boston "News Bureau" states that it is the intention of the striking electricians to extend their strike to other cities in New England and to thus harass the New England Telephone and Telegraph Company until their demands are granted for a \$3-nine-hour day.

The United Traction Company of Albany, N. Y., reported for the five weeks ended May 2, that the total receipts from operation have been \$125,045.16, as compared with receipts for the corresponding period last year of \$120,704.85; showing a gain this year of \$4,340.31.

The following are quotations for some of the industrial stocks not quoted elsewhere: Electrical Lead Reduction, 4½¢@5¢; Electric Boat, 17¢@21¢; Electric Vehicle, 10¢@12¢; Tel. & Tel. Company of America (full paid) 6¢@6½¢; Electric Company of America, 9½¢@9¾¢; National Carbon, 15½¢@15¾¢.

The San Francisco Gas and Electric Company paid a dividend of 25 cents per share a few days ago. Four years ago the company began paying dividends of 50 cents per share monthly. Subsequently these were reduced to 42 cents, then 33 cents and now 25 cents. It is expected that the July dividend will be the last for some time.

The Union Traction Company of Philadelphia has made arrangements with Drexel & Co., to purchase for its account the bonds of the Lombard & South Streets Passenger Railway first mortgage 5 per cent. loan, due December 1, 1901, at 102½ per cent., with coupon due December 1, 1901, attached. Drexel & Co. will purchase the bonds on June 1, 1901.

The winding up of the affairs of the New England Electric Vehicle Transportation Company is in the hands of F. R. Hart and C. L. Edgar of Boston. It is understood that a cash dividend of \$2.25 will shortly be declared which represents cash now in the company's treasury. With the disposal of the real estate and vehicles it is estimated that the company can liquidate at \$4 per share or better.

At the annual meeting of the Chicago Edison Company, to be held on June 10 a proposition to increase the authorized capital stock of \$10,000,000 will be submitted to vote. The new stock is to be issued from time to time, when the directors shall decide what additions to the company's plants are necessary. The annual report of the company given out on Friday shows net earnings of \$902,958 for the fiscal year ending March 21, and a balance of \$145,407 to surplus after paying interest and dividends.

The directors of the New York Electric Vehicle Transportation Company have called an assessment of 10 per cent. on the stock, payable to W. K. Ryan, treasurer, at the Morton Trust Company, by June 6. Certificates should be presented for endorsement of the payment. In a circular, President Sanderson says that a considerable amount of the money must be apportioned to the betterment and enlargement of the Fifth Avenue Stage service. The earnings of the company have steadily increased, the April income being the greatest in the company's history. The demand for service has been constantly in excess of the equipment on hand. The company is experimenting with a new type of battery with double the present capacity. Additional stations must be provided before next winter.

It was learned on Monday in Philadelphia that negotiations between the American Railways Company and the Electric Company of America for a merger of the two corporations had progressed to a practical agreement upon terms, leaving only minor details to be arranged. The plan contemplates the organization of a new company which will issue bonds and stocks to take up the two companies. The basis on which the stock will be taken over if the deal is approved is 55 for American Railways and 11½ for Electric Company of America. The American Railways Company was chartered in New Jersey in 1900, and has an outstanding capital of \$3,757,000 in full-paid fifty-dollar shares. The Electric Company of America was chartered in 1899, and has an outstanding capital of \$20,237,050, of which \$7.50 a share or 15 per cent. is paid in.

EDITORIAL NOTES.

The Meeting of the National Electric Light Association.

Elsewhere in this issue will be found the programme of the Twenty-fourth Meeting of the National Electric Light Association, which is now being held at Niagara Falls. The last Convention held by the Association at the Falls was on June 8, 9 and 10, 1897. Since then many changes have taken place there in the way of new power installations which cannot help but interest the members from a technical standpoint, even though they were present at the '97 Convention.

As may be seen by a glance at the programme, there are a number of interesting papers to be read on subjects of importance to the fraternity, which should elicit discussions that will tend to benefit the delegates in general. Among the reports those by the Committees on Standard Candle Power of Incandescent Lamps, and on Amendments to Freight Classification of Electrical Apparatus, would seem of great importance.

In previous years there has always been an elaborate entertainment programme, but on the occasion of this meeting no set arrangements have been made, as it was thought best to leave the delegates free to attend the Exposition in Buffalo and seek their own amusements, which, as a rule, electrical engineers on an outing have no difficulty in finding.

* * *

The Annual Meeting of the General Electric Company.

The annual meeting of the General Electric Company was held at Schenectady, N. Y., on Tuesday, May 14. Sixty per cent. of the total amount of the stock of the company was represented. There was very little business of importance transacted outside of the election of directors. The fact that Mr. Thomas Edison resigned from the directorate of the company, and that Mr. Frederick P. Fish was chosen to take his place caused no little comment, as it was thought by many that Mr. Edison had been forced out. Referring to the matter the N. Y. "Journal" said:

"Ever since the consolidation of the Thomson-Houston Company, and the Edison General Electric Company the tendency has been

to eliminate everything and everybody identified with the latter company.

"The culmination was reached on Tuesday, when Edison was thrust from the directorate. Plainly it is the wish of the capitalists behind the company and its officers to dissociate from it not only Edison's name, but his personality."

As every one is aware Mr. Edison is not strictly speaking a business man, and much prefers to spend his time in laboratory experiments than in attending directors' meetings and such being the case, the explanation which Mr. Edison is reported as having given, seems a plausible one. Mr. Edison asserts that he sent in his resignation two years ago, but it was not accepted nor acted upon. He resigned, so he says, because he never attended a meeting unless there was lack of a quorum, and then only in response to a telephone call. A month ago there was a pressing call for such attendance, and he responded at great personal inconvenience. He then urged that his resignation be accepted, and insisted on this course. The result was the dropping of his name. His relations with the management of the General Electric Company are now, as they have always been, entirely cordial, so it is claimed, and his retirement from the directorate is solely because he feels that he cannot afford the time necessary to attend to the duties of the position.

The fact that Mr. Fish, who has been elected a director in place of Mr. Edison, is the newly-elected president of the American Bell Telephone Company and the American Telephone & Telegraph Company has given rise to a rumor of a closer friendship in the future between the three companies, in which Mr. Fish is so deeply interested.

* * *

The Braking of Trolley Cars.

The accident which occurred to a trolley car at Leonia, N. J., on May 12, and which was referred to in a short paragraph in last week's **ELECTRICITY**, would seem to warrant the bringing up of the brake question again. As related last week, a trolley car, weighing no less than twelve tons and crowded to the utmost of its capacity with pleasure seekers, broke away in coming down a steep incline, with the result that on reaching a sharp curve at the foot of the hill, the body of the car was thrown on its side, injuring a score of persons more or less seriously. The accident was ac-

counted for by the motorman and others in the failure of the brakes to work properly. It might be in place to state here that the cars on this line are equipped with two independent sets of brakes, hand brakes and friction brakes.

It certainly seems strange that in the accident in question, both sets of brakes should have gotten out of order at the same time, as claimed. A representative of **ELECTRICITY**, who happened to be on the spot, made a cursory examination of the wheels and trucks a few minutes after the catastrophe, and in view of the fact that at that time the brake wheels were so hot that it was painful to touch them with the hand, would lead one to infer that one set of brakes got out of order, and by the time the other brakes could be applied the car had gained such a headway that they were inadequate to check the speed of the vehicle before it reached the curve.

Providing our surmise regarding the cause of the Leonia accident is correct, it certainly behooves the officials of that road to equip its cars with more powerful braking appliances. The New York State Railroad Commission about a year ago had tested in this city some twenty-five varieties of brakes, with the result that an electric brake stood first in order of merit, friction brakes next, a hand-power brake third and air brakes fourth. Such being the case, it would certainly seem as though nothing but the very best brake—apparently an electric one—should be adopted by a trolley road that operates its cars over hills that almost require for climbing a rack and cog.

* * *

The Carrying of Freight by Trolley Cars. Trolley freight cars are now beginning to spring up all over the country, in spite of the fact that a few years ago such a thing was unheard of. Probably the latest road to introduce trolley baggage cars is the Worcester & Southbridge Street Railway Company, which operates between Worcester and Southbridge in Massachusetts. In Michigan there is a trolley road, which conveys coal from one point to another, while in Northern Illinois a similar freight carrying trolley road is projected.

The Massachusetts road referred to above proposes to haul to the towns along the line supplies purchased from Worcester merchants, wholesale and retail, and from the towns to the city the milk and produce of the farmers and dairymen, and such factory products as are intended for Worcester and vicinity.

The company will have a terminal for express in the center of Southbridge and another at New Worcester. At the Southbridge terminal will be a telephone connected with the Worcester central office instead of the Southbridge exchange. This instrument will be free to patrons of the line who wish to order by express from Worcester merchants or others having business for the cars.

The Southbridge man, for instance, can call up a Worcester wholesaler and order a dozen barrels of flour delivered at the Worcester terminal of the company at New Worcester, and the next car will take the goods at the Southbridge terminal. It will be quick business and a great convenience to the suburban towns on the line, as well as a source of profit to the city of Worcester.

At the Worcester end the company plans to have a team to go the rounds and collect and

deliver packages to be sent or brought over the line. Those who have business connections with Southbridge or other towns will be informed that goods to be carried over the company's line will be called for when desired and delivered as fast as the cars can travel. As the trolley line parallels the New York, New Haven and Hartford railroad it is natural that the officials of the steam road should look on the proposed innovation with anything but favor. But as we stated in these columns some time ago, when referring to the carrying of freight by trolley cars, there would seem to be no valid reason why trolley roads should not carry freight, providing of course it does not interfere with the transportation of passengers. That railroad officials should feel more or less anxious and annoyed at this new departure is only natural, for in time it cannot help but effect the business of some of the railroads, especially in the line of farm products.

That the carrying of packages by trolley cars will also tend to hurt the express companies there is little doubt. But on the other hand the carrying of packages and light freight by trolley companies might prove of benefit to the general public, where a road runs from a thickly settled community out into the suburbs. With such a road the carrying of freight would unquestionably be of advantage to commuters, when the filling of a passenger coach with bundles of all sizes and shapes would probably be a thing of the past.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

A CABLE dispatch from London states that on May 17, the committee of the House of Lords passed the Mono Railway bill, which authorizes the construction of an electric express railway between Liverpool and Manchester.

ON May 17 the Statute Revision Commission of Connecticut sent to the General Assembly a new private corporations bill, which, if passed, will take from the General Assembly the incorporation of telephone, telegraph, electric light, street railway and other companies. It is a marked departure from the present law.

CONSIDERABLE use is made of electric switching locomotives in England, particularly in the yards of large manufacturing establishments. Such machines usually are built for a speed of only about four and a half miles an hour, but they are exceedingly powerful and are easily operated. Some of the best of these locomotives have been turned out by American firms.

THE strike of the street railway employees of Albany, Troy, Cohoes, Rensselaer and Watervliet, N. Y., is over. It caused the fatal shooting of two citizens, the wounding of twenty or more and the loss of thousands of dollars to the street railway company and its employees. Sunday, for the first time in twelve days, cars were run over the lines controlled by the United Traction Company and the troops were withdrawn from Albany. The end of the strike came on Saturday when it seemed most remote. The directors of the United Traction Company and committees representing the strikers had been conferring for nearly twenty hours, when by the surrender of two members of the

board of directors of the railway company the terms submitted by the strikers were accepted and signed. The surrender of the board of directors was understood to have been mainly due to the efforts of Anthony N. Brady and W. J. Walker, who are heavy stockholders in the United Traction Company.

A CORRESPONDENT of the London "Electrical Review," referring to the fact that the British Postal authorities recently placed an order in the United States for telephones, says: "It should be borne in mind that, although the telephone was invented in America, the first practical instrument was made and installed in England. British manufacturers promptly took up the matter, and in a few years the industry of manufacturing telephones was well established in this country. Unfortunately, however, the patents were acquired by a company, which at once proceeded to strangle the industry most effectually, and instead of manufacturing on a large scale, bought millions of pounds' worth of apparatus in America and on the Continent during the next 10 years, thus giving foreign manufacturers a splendid start over us, and causing a loss of at least 20 millions to this country."

ACCORDING to a report to the State Department at Washington from Consul Warner at Leipzig, the traffic of the electric railway lines of Saxony has increased considerably over that of last year, as the result of the opening of many new lines in the large cities. About the first of October, 1900, a new company opened up one of its lines to the public and the following figures show the extension in the facilities for the public: Total length of miles of railroad in 1899, 137.54; for 1900, 166.59; total number of persons carried during 1899, 113,592,390; for 1900, 147,645,690; total number of motor cars for 1899, 731; for 1900, 1,028; total number of trailers for 1899, 289; for 1900, 403. In conclusion the Consul says that other lines will be extended in Saxony during the present year, and as a consequence large supplies of steel rails and road equipments will have to be obtained.

LAST week the information was given out in insurance circles at Dallas, Tex., that fire insurance policies in many Texas cities and towns are to be cancelled on June 1 unless defects in electric wiring are remedied. An order has already gone out to cancel all policies held in Fort Worth and Gainesville. In March an inspector examined Fort Worth and his report was submitted to the Southeastern Association of Underwriters who passed it. The association concluded that Fort Worth was the worst wired city in the South and ordered every policy cancelled where owners refused to comply with the standard of the National Electrical Code.

ADMIRAL BRADFORD, chief of the naval bureau of equipment has given out the following extract from the report of the board which has investigated the question of transmitting messages by wireless telegraphy: "From the examination of the subject, as outlined in the orders of the department, the board makes the following recommendations: 1. That the use of homing pigeons be discontinued as soon as wireless telegraphy is introduced into the navy. 2. That pending such action, no new pigeon cotes be established. That wireless telegraphy be adopted by the

navy for transmission of messages between distant points. Referring to the last recommendation, the board is of the opinion that a high degree of special electrical training is demanded for the successful operation of any system of wireless telegraphy, and therefore suggests as necessary the establishment of two stations sufficiently far removed from each other for the training of officers and men. In its opinion this requirement would be best met by the establishment of such stations at the navy yard, Washington, and the Naval Academy, Annapolis. If wireless telegraphy fulfills what now seems to be its possibilities, the cadets should be thoroughly trained in it."

A PARTY of chief engineers and other experts connected with German street railways will arrive in this country the first week in June to study the American electric car systems. Though the German engineers will not be empowered to close any contracts for material, equipment, etc., with American manufacturers, they will gather data for submission to their respective executive officers, which it is anticipated will result in substantial orders being placed in the United States. This will be the first visit to America of electrical experts from Germany.

At a recent meeting in England of the Engineers and Shipbuilders' Institute a paper was read on liquid fuel, in which the different methods of burning oil was discussed. First, there is the system of mechanical spraying of oil by means of its own pressure—a system that requires a firebrick-lined furnace. It is said to require a large furnace capacity and a large excess of air, but the system is simple and noiseless, and 12½ lbs. of evaporation has been secured, which represents 64.6 per cent. efficiency with Borneo oil. The second system includes the admission of the oil as a gaseous spray by means of steam or air. A partial lining of firebrick is required in this system also, together with brick bridges and baffles.

A HUNGARIAN electrician, named Louis Zoltan, has invented an apparatus by which he claims he can send 80 telegrams simultaneously on the same wire, 40 in each direction.

The last cable car will be run on the Broadway line in New York next Saturday night, and the whole Metropolitan system will be then operated by electricity. It was thought that the cable would be cut last Saturday night, but owing to a delay in the perfection of the plans the work had to be postponed for a week. Every road of the Metropolitan Traction Company, except the Broadway, is now being operated by electricity. The Lexington avenue road changed from cable to electricity two weeks ago, and the Columbus avenue one week ago.

PROF. F. C. CALDWELL, who was retained some weeks ago to make electrolysis tests for the city of Columbus, O., to determine the danger of the water pipes being damaged by contact with currents of electricity escaping from the street car tracks, has filed his report with the board of public works. In it he states that the tests show a danger of electrolysis of the pipes and recommends that in the future the pipes be laid in the alleys and that the railway companies be compelled to improve the connections between the rails.

TWENTY-FOURTH CONVENTION OF THE NATIONAL ELECTRIC LIGHT ASSOCIATION.

The annual Convention of the National Electric Light Association now being held at Niagara Falls, will probably be long remembered by those who are fortunate enough to be present. No better spot could have been selected for the meeting place, owing to the proximity of Buffalo, where at the Pan-American Exposition can be seen almost every type of electrical device which cannot help but interest the delegates. The power stations at

WEDNESDAY, MAY 22.

Morning Session, 10 o'clock.

Paper by H. W. Hillman, Schenectady, N. Y., "Arc Lighting at the Beginning of the Twentieth Century."

Report of Committee on Photometric Value of Arc Lamps, Henry L. Doherty, chairman.

Afternoon Session, 2:30 o'clock.

Paper by Louis R. Wallis, Woburn, Mass. "The Foresee (4-C) System of Charging."

Report of Committee on Uniform Accounting, G. E. Tripp, chairman.

Report of Committee on Analysis of Flue Gases, Henry L. Doherty, chairman.

Executive session.

JAMES BLAKE CAHOON,
President of the National Electric Light Association.

the Falls will also be visited as well as several of the manufactories in which the electric current plays an important part.

As usual the social and entertainment features will be everything that can be desired, and that the meeting will prove most instructive to the professional men present may be gathered from the programme which is as follows:

TUESDAY, MAY 21.

Meeting of the Executive Committee at 9 A. M. at the Secretary's office, International Hotel.

Morning Session, 10 o'clock.

At Convention Hall, International Hotel:
Address by President Cahoon.

Paper by C. R. Van Trump, Wilmington, Del., "A Station Load Diagram."

Afternoon Session, 2 o'clock.

Paper by Francis W. Willcox, Harrison, N. J., "The Practical Side of the Incandescent Lamp."

Report of Committee on Standard Candle-Power of Incandescent Lamps, Dr. Louis Bell, chairman.

Report of Committee on Amendments to Freight Classification of Electrical Apparatus, James I. Ayer, chairman.

Report of Committee on Legislative Policy, Samuel Insull, chairman.

THURSDAY, MAY 23.

Morning Session, 10 o'clock.

Paper by Augustus Treadwell, Jr., New York City, "Storage Batteries in Central Station Work."

Report of Committee on Rules for Electrical Construction and Operation, Capt. William Brophy, chairman.

Topic: "Steam Heating from Central Stations."

Afternoon Session, 2:30 o'clock.

Paper by Calvin W. Rice, New York City, "Distribution of Current at High Potential in New York City."

Report of Committee on Amendments to By-Laws, Samuel Insull, chairman.

Executive session.

Reports of Secretary and Treasurer and Executive Committee.

Associate Members, turquoise blue ribbon.

Reception, yellow ribbon.

Guests, rose ribbon.

Honorary members, white ribbon.

Press, olive green ribbon.

THE PAN-AMERICAN OPENING AND DEDICATION.

BY FRANK C. PERKINS.

The Pan-American Exposition was formally opened on May 1, but the dedication ceremonies took place on Monday, May 20. There were flights of pigeons, a display of Japanese daylight fireworks, the ascension of gas balloons and music on every side.

The invited guests assembled at the Temple of Music, where the Rt. Rev. C. H. Fowler, Bishop of the M. E. Church, made the opening prayer. Then followed addresses by Hon. Conrad Diehl, Mayor of Buffalo, by the Hon. Theodore Roosevelt, Hon. Henry Cabot Lodge, Hon. Timothy L. Woodruff and other well known men. Poems suitable to the occasion were also read. There were military and civil parades and altogether the ceremonies were most imposing.

The exhibits in the Electrical Building are nearly all in place and in running order.

ing. This company has sent to its exhibit a model of its shops in Schenectady, N. Y., Lynn, Mass., and Harrison, N. J., which are embellished with thousands of small electric lights, making a very pleasing and interesting exhibit.

The largest storage battery cell in the world it is said, is installed in the exhibit of the Gould Storage Battery Company of Depew, N. Y. The exhibits of the D. & W. Fuse Company, of Providence, R. I., are especially interesting, showing a full line of their inclosed fuses, junction boxes, entrance cut-outs, etc., for low and high tension service.

The American Lamp and Brass Company has a very fine display of handsomely decorated electric table lamps in Section "M" at the entrance nearest the Electric Tower. The telephone exchange is now complete, one of the finest switchboards of the common battery system of the Bell Telephone Company being shown in operation in its exhibit. The Stromberg-Carlson Telephone Company of Chicago

ELECTRICITY BUILDING, PAN-AMERICAN EXPOSITION.

The accompanying illustrations of the Electric Tower and the Temple of Music give but a slight idea of the beauties of the decorative effects on these magnificent structures. The switchboard and step-down transformers are now in place in the General Electric Exhibit and in perfect operation.

The large Stanley generator, weighing 45 tons and generating current at 12,000 volts potential with a capacity of 1,500 hp., is now in place and makes an interesting exhibit. The 75 ton 300 hp. Westinghouse gas engine is in place and above it in the Central Dome amid the varicolored bunting artistically draped are a large number of 200 candle power Nernst lamps, producing a lighting effect between the arc and the incandescent. In this electrical display above the engine the illuminating effect will aggregate about 20,000 candle power.

One of the most interesting exhibits to arrive was an old Edison Z Type Dynamo built in 1878, loaned as part of the Historical Exhibit of the General Electric Company of Schenectady. The booth of this firm is now completed. On the top is a roof garden, a unique feature, with chairs and palms. Here visiting engineers may sit and get a complete view of the entire build-

ing. This company has sent to its exhibit a model of its shops in Schenectady, N. Y., Lynn, Mass., and Harrison, N. J., which are embellished with thousands of small electric lights, making a very pleasing and interesting exhibit.

has installed a most expensive exhibit, having in addition to its regular exhibition sets about 60 'phones on the grounds used by the Exposition Company gratis. It required more than 300 miles of wire to complete the circuits. The other telephone exhibits are many of them in place, the Clark Automatic Telephone Switchboard Company of Providence, R. I., having been one of the earliest to complete its installation, showing desk sets, Clark dials with hand microphone, automatic switchboards for various number of points with front and backs removed, together with individual automatic telephone switches open for inspection to operate 75 telephones.

The National Carbon Company of Cleveland has a booth constructed entirely of carbon, the pillars being 9 inches in diameter and 5 feet high. They are the same as used in electric furnaces.

Mr. Charles T. Yerkes sailed on May 16 for England in connection with the underground traction in London. He plans to be gone only a month in the event of preliminary work progressing as he now expects.

"Electricity's" Educational Series.

BY R. MAX EATON.

ARTICLE NO. 28.

ELECTROLYTIC DEPOSITION OF METALS.

Electroplating is a method of depositing metals from a solution of their metallic salts by electrochemical means. The industries dependent upon this branch of electrical application do not appear to be as widespread or as important as electric lighting, power, telephony or telegraphy, but, although electrochemical operation is not brought so vividly to the public notice, yet it covers a wide field of industries and to it we are indebted for many of the necessities and luxuries of life, while it also plays an important part in such

GEORGE FRANCIS SEVER,
Superintendent Exhibits, Electricity Building, Pan-American Exposition.

industries as electrotyping, bronzing, gilding, refining of metals and in the smelting of certain ores. Mostly all of the processes depend upon the laws of chemical action.

By electroplating is meant the process of covering articles of metal by a thin layer of another metal by means of electrolysis. The deposit is usually nickel, copper, silver or gold, and the metals most usually plated upon are brass, iron, steel, copper, german-silver, or white metal.

Plating vats for holding the solution and the articles being plated may be of any size, depending upon the amount of work to be done. They are usually made of wood and for nickel plating may be lined with lead, although this is not necessary. The usual arrangement for the current supply is to have two copper bars, on each side of the vat, one above the other and insulated from each other. One of these bars will be connected to the positive current and the other to the negative. Brass rods, to which are suspended the articles to be plated, are placed across the vat and resting on the negative bars. The metal being deposited is suspended from rods in contact with the positive bars. The whole is arranged so that the current will flow through the solution from the metal being deposited, known as the anode, to the articles being plated, known as

the cathode. The articles to be plated are ordinarily suspended by pieces of copper wire, excepting in silver or gold plating, when insulated wire is used to avoid an unnecessary deposit upon it. Of course the insulation is removed from the wire where it makes contact with the article being plated and the suspension rod.

As the quality of the deposit which is made in electroplating is of the greatest importance the following are the points to be looked after most carefully. The strength of the current, which is dependent upon the amount of surface to be plated, the density and temperature of the plating solution and the condition of the articles to be plated, when put into the solution. The current is most ordinarily furnished by small dynamos specially constructed for that purpose, which produce a low pressure with considerable ampere capacity. The pressure and current may be adjusted by means of an adjustable resistance box connected in circuit with the field coils of the dynamo. When

it. Brass, copper, iron or steel are the metals which are usually nickel plated, and the hardness of the nickel and the high durable polish makes a very satisfactory and lasting finish. The solution used is made from a combination of sulphate of nickel and sulphate of ammonia. This combination is ordinarily known as nickel salts. To make the solution, this salts should be dissolved in warm water in the proportion of about three-quarters of a pound of salts to a gallon of water.

To prepare articles for plating they must be very carefully polished and cleaned, after which they must be scoured by dipping in a hot lye solution and pickling in acid. The pickling in acid is very essential as the acid takes off the thin covering of oxide which quite often sticks to iron, copper or brass. If this oxide is not thoroughly removed the plating is liable to peel off when burnishing and polishing the articles. The deposit made on the cathode occurs as a result of electrolysis, while an equal amount of the metal will go into the solution

will become so intense that it will cause it to boil over and a great amount of heat will be generated. A solution of this kind should be kept in a dark place. There are a number of other salts of silver, such as chloride of silver, cyanide of silver, acetate of silver, sulphide of silver and oxide of silver, but none so commonly used in electroplating as nitrate of silver.

The process for silver plating is very much the same as in nickel plating. In preparing articles for silver plating the same precautions as regards cleanliness must be observed as in nickel plating.

GOLD PLATING.

The solution most commonly used is cyanide of gold and in principally all work is used when hot. Great care must be given to the details of gold plating to have all the conditions just right so that a satisfactory color may be secured. To accomplish good work much experience is necessary and it is difficult for amateurs to secure good results, besides it constitutes expensive experimenting.

The gilding of the inside of vessels, as often seen in silverware, is done by filling the vessel

TRANSFORMERS IN ELECTRICITY BUILDING, PAN-AMERICAN EXPOSITION.

the current is of the proper amount the covering which is deposited on the plated articles adheres closely and is hard and clear and will be deposited with reasonable rapidity. When the current supply is not sufficient the deposit may be of good quality, but the plating proceeds too slowly. When too much current is forced through, the deposit is liable to become dull or black and rough while gas is often given off at the cathode. Edges and points of articles being plated often gather a rough or granular deposit while the flat parts may be taking satisfactorily. Such difficulties can be overcome only by a proper adjustment of the distance between the anodes and cathodes. When articles which have great irregularities of surface are to be plated the distances between anodes and cathodes must be greater than when of a uniform surface, otherwise the more prominent points of the articles will receive heavy deposits while the hollows may receive little or none. It is important that as uniform a deposit as possible be placed on an article.

NICKEL PLATING.

Nickel plating is probably the most generally used and I will first describe the process of

from the anode, which is the plating metal. The amount of plating put upon an article of course may be controlled by the discretion of the person doing the work, as there is no rule governing just how heavy or how thin a plate may be.

After the plating is completed in the bath the articles, to have a finished appearance, must be put through a series of operations such as scratching, buffing and polishing which is done on rapidly revolving wheels covered with leather or canvas.

SILVER PLATING.

A salt of a metal is a chemical combination formed by the action of an acid on the metal and when we speak of salts of nickel or salts of silver we mean that it is a chemical combination of that metal formed by the action of acid upon it.

The solution which is used for silver plating is usually nitrate of silver produced by the action of nitric acid upon silver. To form this combine about four parts of the strongest nitric acid to one part of pure water and then add small pieces of silver at a time until the solution will dissolve no more silver. The silver must not be added too rapidly or the action

HENRY RUSTIN,
Superintendent Mechanical, Hydraulic and Electrical Engineering features at Pan-American Exposition.

with the solution and then placing it in contact with the negative current while the positive current is attached to a gold anode suspended in the center of it.

COPPER PLATING.

Copper plating is principally used in the process known as electrotyping, which is used so much in the printing industry. In electrotyping an impression of type, which is set up, or of cuts is taken on wax or paper pulp. The surface of the mould is then covered with powdered graphite to provide conductivity for the current, after which it is immersed in a bath of sulphate of copper as the cathode while a sheet of pure copper forms the anode. In the process of the electrolysis a thin coating of copper is deposited all over the surface of the mould which can be detached from the mould after it is taken from the bath.

The copper impression is then trimmed and backed up by a filling of type metal which is melted and run on the back and will then form a solid plate being in impression an exact duplicate of the type or cuts.

Copper plating is done to give a bronze finish to iron and is also used to make a foundation coating upon iron articles which it is desired to silver plate.

Article No. 29 will be entitled, "Condensers and the Measurement of Their Capacity."

THE HORSE POWER OF BOILERS.

BY W. H. WAKEMAN.

Some time ago I took up one of our excellent papers and found an article in it by a well known writer on the horse power of steam boilers. It will answer my purpose at this time to give his ideas in a general way, for such mistakes deserve at least a passing notice in order to prevent those who are not well informed on the subject from falling into error instead of absorbing correct information.

The ideas that I take exception to may be briefly stated as follows: There is no such thing as the horse power of a boiler, when considered independently of the engine. If a boiler is furnishing steam for a 75 horse power engine, it is a 75 horse power boiler. If it furnishes the required amount of steam without forcing it, then the boiler is as large as the maker intended it to be, but if it is necessary to force it continually, then it comes short of the maker's rating and should be condemned accordingly.

ELECTRIC TOWER ILLUMINATED (Incomplete) PAN-AMERICAN EXPOSITION.

I propose to show that such statements are unreliable and should fail to receive the slightest consideration. The following illustrations will make this clear as they are taken from my own practice and therefore are not theoretical conditions, but show the practical failure of attempting to rate a boiler by such a false standard.

A 75 horse power engine was supplied with steam by two boilers, each one of which was rated by the builders at 50 horse power. It was impossible to keep up steam and something had to be done in order to keep the plant in operation. According to the plan advocated by this correspondent, the engine was 75 horse power, therefore each boiler was 37.5 horse power and consequently was falling below the builder's rating by 25 per cent., which is a very large deficit. During the course of my investigations there I took some diagrams from the engine when a full load was on and found that it was developing 118 horse power.

Now this shows another mistake that is really not the intention of this article to expose, but as it is of interest to engineers, hence will receive attention.

An engine may be rated at 75 horse power, at fixed speed and with a certain mean effective pressure, but that does not prove that it will always develop 75 horse power, for while the speed may remain practically constant, the mean effective pressure will vary with the load, therefore the builder's rating of an engine shows that it is capable of developing under given conditions, but it really gives little or no clue as to what the machine is actually doing. As an extreme illustration of the truth of this statement I would say that I have taken diagrams from an engine which showed less than 4 horse power, but taking the idea of a fixed rate as advanced by some writers, in a literal sense it was still a 75 horse power engine.

When the engine above referred to was developing 118 horse power, the boilers were worked as hard as the available draft would admit, for the fires had to be sliced at short intervals, so that much good coal was sifted through the grates and lost in the ashes. Even the casual observer could tell that these boilers

were overloaded, for the given conditions, and yet steam was used for no other purpose except to run this so called 75 horse power engine. How absurd the idea of giving both boiler and engine the same rating is to any one who has given the subject a reasonable amount of intelligent study.

Another illustration of a slightly different character, but taken directly from practice, will show the fallacy of connecting the rating of boilers with the rating of engines.

A certain plant had two boilers that are rated at 100 horse power. They supply steam for an engine that is rated at 80 horse power. At times these two boilers are worked as hard as any boilers ought to be, yet are only furnishing 80 horse power, or 40 horse power each. There certainly is something wrong here, and when the indicator establishes the fact that the engine is developing only 45 horse power, it makes matters worse yet.

When I state that much live steam was used for purposes with which an engine has no connection, it will explain the trouble, but it does not make the idea that a boiler should always be rated according to the power developed by the

engine used in connection with it, any the less absurd or incorrect. I am justified in making this comparison of results because the idea of rating boilers on this erroneous basis is advanced without explanation or qualification.

I will go a step further and say that when these boilers are worked hardest, the engine is not running at all. How would said rule apply in such a case, taking it in its literal sense? It would decide that the boilers were not developing any power at all, and yet even the man who was shoveling the coal would not agree with this verdict.

If writers on this subject would devote their energy to explaining that the rating of a boiler has nothing whatever to do with the rating of the engine to which the steam is furnished, it would simplify matters, although it would at the same time deprive me of one subject on which to write an article, but I am perfectly willing that this should be done, for there seems to be no end of subjects on which to write articles for the mechanical press.

It has been said that we should not criticise another man's idea unless we have a better one to offer in place of it, and this is usually true.

THOS. M. MOORE,

Superintendent Exhibits, Machinery and Transportation Building, Pan-American Exposition.

In following out this plan I will state that when 30 pounds of water have been evaporated in one hour, under stated conditions, one horse power has been developed. This is the whole thing in a nutshell. The use to which this water is applied, after it has been evaporated into steam, has no bearing on the case whatever, and the two should not be mixed up together as they so frequently are.

I am certain that some reader will ask how he is to determine the size of boiler required for a given engine, and it gives me pleasure to reply as it is a very easy matter to decide.

Every engine should be sold under a guarantee as to the amount of steam it will take to run it for each horse power developed. Then multiply the horse power developed by the pounds of steam required to produce a horse power in this engine, and divide the result by 30. The quotient will be the horse power that the boiler must develop. If the actual conditions vary much from the standard conditions the former must be reduced to an equivalent of the latter, and the number so obtained is to be used as a divisor.

For illustration, suppose that a slide valve engine is to be installed to develop 90 horse power, taking 45 pounds of steam per horse power. How much power will the boiler de-

velop? $90 \times 45 \div 30 = 135$ horse power. The proper thing to do in such a case is to order a boiler that is guaranteed to develop 135 horse power, and when it is installed have a test made in order to find out whether it is capable of doing the work for which it was designed, or not. If it is impossible to keep up the required pressure of steam a test may determine that the engine is calling for perhaps 150 horse power at the boiler, so that it is doing 15 horse power more than it should be called upon for, and it would be very unjust to conclude that the trouble is due to insufficient boiler capacity.

If an automatic engine is installed that requires 30 pounds of steam per horse power, and 200 horse power is to be developed, then it will require two boilers each of 100 horse power to furnish the steam.

condensing engine will require but 19,980 per hour or 333 per minute.

These figures do not apply to the number of heat units that disappear in developing power, in any case, but to the number that must be generated by the boiler, and supplied to the engine.

NOTES ON METER TESTING.*

BY ARTHUR T. SMITH, A.M.I.E.E.

It is surprising what little attention is often paid to this most important branch of central station working, especially in the smaller stations. Meters are ordered, and delivered by the makers, and are put on one side until needed; possibly one is tried to see if it will start, and it is put in circuit with an 8 or 16 cp. lamp. If it starts well and good, the meter

of meters, and will take the Chamberlain & Hookham meter as an example, I will certainly give this firm credit for care in their testing, and for their fair dealing in the matter of complaints and inaccuracies. It is satisfactory to know that the difficulty which the makers of this meter at one time experienced with regard to the amalgamation of the armature is now entirely overcome, and I am anticipating no trouble with it in the future. It is sometimes necessary to renew the armature, owing to its being burnt up through a short circuit, or from some other accident damaging it in any way. A little care is necessary in removing the armature and replacing with another.

The mercury should be removed and the meter taken out of the case, then inverted, and the four screws removed from the plate holding the pivot and the iron bridge piece. (It is advisable always to unscrew the pivot first to prevent any accident to it.) If now the spindle be examined, two small file cuts will be noticed, one on the spindle and the other on the collar of the brake disk; this denotes the way which the little taper pin draws out, and this should be remembered in replacing the pin in another brake and spindle. When the pin is withdrawn the armature and spindle will draw out and leave the disk. On the meter being put together again and filled with mercury, it sometimes happens that an air bubble lodges under the armature, this must be removed or the meter will not start easily, but is easily gotten rid of by tilting the meter and revolving the disk. Before putting in a new armature care must be taken to scrape and thoroughly amalgamate the edge.

To test the meter for accuracy the handiest measuring instrument is a shunted ammeter and a set of shunts by the Weston Company, as with this instrument it is possible to measure currents from .01 ampere to 150 amperes, which gives a range sufficient for all ordinary purposes. It is the best plan to have the shunts mounted on a slate with a switch which throws each shunt in as required without breaking the circuit. The current must be capable of being varied, and this is most readily accomplished by sets of lamps and a resistance for fine adjustments. A booster may be used for higher currents than 10 to 15 amperes. The meters to be tested are all put in series, and I find it handy to put a slip of paper before each one with the number and capacity with any other items which may be needed, such as the testing currents, the constants obtained, etc., the results being finally entered in a book kept for the purpose.

The meters are first tested for starting, and the lowest current at which each starts is noted. With a 5 ampere meter the testing currents may be 1, 2.5 and 5 amperes, and start with .2 ampere or under. In each meter there is a small label on which is written the testing constant, which is "The figure that should be always obtained by multiplying the number of amperes passing through the meter by the number of seconds (or fraction of a second) occupied by one revolution." In practice it is advisable to take 10 times as many revolutions as the number of amperes passing through the meter. For example, testing with 1 ampere, count 10 revolutions, and the number of seconds on the stop-watch ought to agree with the value of the constant, that is, with the figures; the decimal point, of course, would be wrong, but that is not needed. With 2.5 amperes count 25 revolutions and so

TEMPLE OF MUSIC (ILLUMINATED), PAN-AMERICAN EXPOSITION.

Perhaps a compound condensing engine is to be used, that will develop 800 horse power, at 18 pounds of steam per horse power. This will call for 14,400 pounds of steam per hour, and 480 horse power of boilers will be sufficient to supply this steam.

The above statement of facts should show conclusively that the power developed by the engine, has nothing whatever to do with the boiler power required, except to supply a basis for calculating the latter. I have stated that 30 pounds of water evaporated per hour under given conditions constitute one horse power, but I did not explain what the conditions were, nor how to reduce the results obtained under other conditions to this standard, because a full explanation of these matters calls for an article on that subject alone, and at this time I wish to emphasize the idea that the two standards are not the same, and in reality have no connection with each other.

The boiler horse power calls for the use of 33,300 heat units per hour, or 555 per minute, and is always the same, while the number of heat units required for the engine horse power varies with the type of engine used to develop the power.

In the slide valve engine used in the first illustration, it calls for 49,950 heat units per hour or 832.5 per minute, while the compound

goes out; if it will not start, then it is often put on one side for a further consideration later on. To err is human; certainly electricity meter makers are sometimes very human, and it is advisable to test the accuracy of the little slip of paper which is often inserted in the meter and called the "Certificate of Test."

In many stations it would not pay to employ a man solely for meter testing, and it therefore devolves on one of the assistants. And it is this point which is often the cause of the neglect, as each assistant depends on the other, and neither, as a rule, knows what the other has already done. To obviate this, one assistant in a station should thoroughly understand the meters and testing, and not only know how to test a meter, but have a thorough theoretical knowledge of the principles of the meters used on that station. It is, of course, useless to expect a man to know every type of meter made, and hence even in the meter department uniformity of type is advisable; as few types of meter should be used as possible, not only for this reason, but because the spares and duplicate parts to be kept in stock are considerably reduced.

I give herewith a few hints as to the testing

*From the "Electrical Review," London.

on. By this means all calculations are avoided as the constant may be read directly off the watch. Below is an example of an actual test as entered up in the station test book:

No. of meter.	Size.	Current.	True constant.	Constant obtained.	Per cent. inacc'y.	Starting current.
21,732	5	1	4.67	4.64	.6 +	.2
..	..	2.5	"	4.68	.2 —	..
..	..	5	"	4.70	.6 —	..

REMARKS—Meter brought in dirt under brake disk.

If the meter is too fast on all loads it may be adjusted by slightly lowering the four brake poles above the Foucault brake disk, and by raising the poles away from the disk the speed may be increased. It may happen, however, that the meter has not the same percentage accuracy throughout the range, and may be slow at top load. This may be altered by giving the series coil more effect by inserting a small paper or thin fiber washer between the yoke which is in front of the meter, but if the reverse be the case and the meter is fast at top load, then the washer must be inserted between the back yoke. This weakens the action of the series coils and reduces the speed on top loads.

The 2½ ampere meter which this firm has brought out is a useful size, and especially as the price is lower it will bring down the cost of small consumers. These meters are sent out with the mercury separate, and it is absolutely important that they should be filled immediately on arrival or oxidization of the edge of the armature may take place and the accuracy of the meter be impaired.

The Bastian meter is a useful meter where the consumption with small currents is to be measured. To test this meter no current need be used, as all that is necessary is to calibrate the capacity of the tube containing the electrolyte.

Whatever the type of meter to be tested, accuracy and a methodical way of working are absolutely essential, and experience alone will reveal all the shortcuts. I have written these few and brief notes in the hope that they will be of use to some, and that they will also raise the interest taken in this often neglected department of electrical undertakings.

Experimenting With the Electrograph.

A photograph was successfully transmitted over a telegraph wire from the offices of the Associated Press in the Star Building at Washington, D. C., to New York City a few nights ago. The experiment was made to demonstrate the perfection of the electrograph, an instrument known as the Palmer and Mills invention. The two instruments used in the experiment are the only ones in existence, and they will be placed on exhibition at the Pan-American Exposition at Buffalo. It is confidently predicted by the inventors that the electrograph will soon be in practical use. To transmit a picture over a telegraph wire it is first photographed through a screen on a metal plate, similar to the process of making half-tones. The plate is then covered with wax, which is ground into all of the indentations in the plate and forms a non-conductor to the electric needle which passes over and transmits the raised metal lines to the receiving instrument at the other end of the wire.

LONG DISTANCE POWER TRANSMISSION FROM NIAGARA FALLS.*

BY H. W. BUCK.

There are three separate transmission circuits from the Niagara power house to Buffalo, two of which are copper, and installed on the same pole line. The third circuit is strung upon a separate pole line throughout its entire length and is of aluminum instead of copper. This aluminum line has the same resistance as each of the other two, and is composed of three cables of 500,000 circular mils each, made up of 37 strands. At the present market price of copper wire it is cheaper to use aluminum for overhead lines where the conductors do not have to be insulated. The conductivity of aluminum is less than copper, and the price per pound is greater, but the volume per pound of aluminum is much greater than that of copper on account of the lower specific gravity of the metal. When, therefore, resistance per pound is taken as the basis for comparison, aluminum is found to be cheaper.

Since the long-distance service to Buffalo was started in 1896, the line has been operated at a potential of 11,000 volts; but recently the voltage has been raised to 22,000, and the capacity of the three Buffalo circuits is now 30,000 hp., with about 10 per cent. line loss. No power is taken from the Buffalo transmission line until North Tonawanda is reached—a distance of about 10 miles. The Tonawanda Power Company, which is the name of the organization distributing power in this district, is a sub-company of the Niagara Falls Power Company, and at present utilizes about 1,000 horse power.

At the point where the Buffalo transmission line is tapped with supply lines for the Tonawanda sub-station the transmission line which supplies the city of Lockport with electric power is also connected. This branch line, consequently, has the same voltage, phase, and frequency as the Buffalo line. Its length is about 15 miles, making the Lockport sub-stations about 25 miles from Niagara Falls. Three hundred horse power is used by the local electric lighting company in motor generator sets, and about 600 hp. in a rotary converter sub-station which supplies power for local electric railroad service. It is from this sub-station that the 40-ton electric locomotives are operated which daily haul heavy freight trains on this feeder of the Erie Railroad, hauling at times as many as 28 loaded freight cars. Since the sub-station feeds direct current for a distance of 10 miles beyond the sub-station, on certain sections of this route the locomotives receive their power at a distance of 35 miles from the Niagara power house. This is a forcible illustration of what can be accomplished by the application of electrical power to steam railroad service.

About 23 miles from the Niagara power house, just inside the city line of Buffalo, the overhead circuit of the Buffalo transmission line enters the terminal house of the Cataract Power and Conduit Company. This company, which is also a sub-company of the Niagara Falls Power Company, distributes Niagara power throughout the city of Buffalo, purchasing it from the Niagara Falls Power Company at the Buffalo city line, at which point the responsibility of the latter company nominally ceases. In the terminal house the 22,000 volt current is transformed by six of the largest

*From "Cassier's Magazine."

transformers in the world, 3,000 hp. each, to three-phase, at a pressure of 10,000 volts, in which form it is distributed by underground cables to the various Buffalo sub-stations.

LONDON NOTES.

(From our London Correspondent.)

British Power Transmission Schemes.

During the past few weeks some important electrical schemes have been under the consideration of Parliamentary Committees in London. One of these is the Caledonian Electric Power Bill, which proposes to supply electrical energy from seven different generating stations for factory driving and lighting supply over an area of 1,135 square miles. Of the seven stations one would be placed near Yoker, one near Renfrew, one at Port Glasgow, one between Renton and Dumbarton, one near Uddingston, one near Kilmarnock, and one at Irvine. At the outset the combined capacity of these works will be 30,000 kw. and the capital cost is set down as about \$6,500,000. The area of supply contains large quantities of unexhausted coal and iron, and is a busy manufacturing district, where a supply of cheap electric power will confer enormous benefit. Lord Kelvin gave evidence in support of the proposal and said that the positions chosen for the seven generating stations were so arranged that the maximum distance which the power would have to be sent was 15 miles.

Another scheme of a similar nature is known as the Clyde Valley Bill, and it covers the greater part of the district included in the Caledonian proposal.

Yet another undertaking which is now being deliberated upon in committee is the Cleveland and Durham Electric Power Bill. It covers an area of 820 square miles south of the River Tees. The Cleveland district with its great iron-stone mines and ironworks is included. There will be six or seven generating stations of a joint capacity of 30,000 kw. and the capital is set down as \$6,500,000.

Storage Batteries in Power Stations.

Mr. J. S. Highfield, the engineer of the combined lighting and tramway system at St. Helens, has read an exhaustive and instructive contribution before the Institution of Electrical Engineers, entitled "Storage Batteries in Electric Power Stations, Controlled by Reversible Boosters." He stated that the use of batteries in direct current central stations has now become general, but there is a divergence of practice among engineers in the matter of the proportion that the battery bears to the steam plant. He gave a table showing the proportion of battery capacity to the steam plant capacity in many such stations in England. As there seemed to be no good reason for this great diversity of practice, Mr. Highfield placed before engineers what seemed to him to be the chief points in considering the designing of batteries for the work they are called on to do in central stations. He further described certain subsidiary apparatus which might be found of use and convenience in operating batteries. For his purpose Mr. Highfield divided stations into three sections, viz.: (1) lighting and general supply stations; (2) traction stations; (3) combined stations for supplying to the general town network and to a tramway system. The paper was illustrated by a large number of load curves.

Meeting of the American Society of Mechanical Engineers.

The American Society of Mechanical Engineers will hold its forty-third meeting at Milwaukee, Wis., on May 28 to 31. The programme of papers to be read is as follows:

"Requirements of Electricity in Manufacturing Plants," by W. S. Aldrich.

"Portable vs. Stationary Machine Tools," by John Riddell.

"Report of Committee on Standardization of Methods of Making Engine Tests."

"The Practical Application of Superheated Steam," by George A. Hutchinson.

"Superheated Steam," by E. H. Foster.

"Drafting Room and Shop Systems," by F. O. Ball.

"Blue Printing by Electric Light," by H. G. Reist.

"Rules for Drawing Office," by A. W. Robinson.

"Influence of Titanium on the Properties of Cast Iron and Steel," by A. J. Rossi.

"A Few Instruments of Precision at the Paris Exposition of 1900," by William E. Reed.

"Bevel-Gear Cutting Machines at Paris," by Fred J. Miller.

"The Locomotive Exhibits at the Paris Exposition of 1900," by Storm Bull.

"New Connecting Rod End," by C. W. Hunt.

"Method of Filing and Indexing Engineering Literature, Notes, Data, etc.," by George H. Marr.

"A Filtration Plant at Albany, N. Y.," and "Tests of a Hydraulic Air Compressor," by William O. Webber.

"The Bardwell Voltmeter," by Bardwell and Hamilton.

"Some Experiments on Ball Step-Bearings," by Chas. H. Benjamin.

"Pulley Press Valve," by F. H. Stillman.

"Determination of Fly-Wheels to keep the Angular Variation of an Engine Within a Fixed Limit," by J. I. Astrom.

"A Special Form of Boring and Facing Machine," by W. S. Russell.

"Efficiency Tests of 125-hp. Gas Engine," by C. H. Robertson.

"A Method of Preparing and Baling Cotton in Round Bales," by J. R. Fordyce.

"Protecting Ferric Structures," by M. P. Wood.

"An Improved Type of Ingot-Heating Furnace," by F. H. Daniels.

"The Entertainment of the Visiting Engineers in Europe in 1900," by H. H. Suplee.

The excursions will include trips through the plants of the Edward P. Allis Company, Nordberg Manufacturing Company, Filer & Stowell Manufacturing Company, Vilter Manufacturing Company, Christensen Engineering Company, Bucyrus Company and other shops in the vicinity; also to Waukesha and Mineral Springs.

Business Not Interrupted by Fire.

In the issue of *ELECTRICITY* of May 15 there appeared a four line item stating that the plant of the Standard Telephone & Electric Company of Madison, Wis., had been practically destroyed by fire. The company now writes regarding the matter as follows:

"We had on hand at the time of this fire practically \$100,000 worth of merchandise. Of this stock, we were damaged to the extent of \$10,000, fully insured. The building was not

insured, and was damaged to the extent of \$1,000. Our machinery was stopped less than two days, just long enough to admit of adjusting the loss with the insurance companies. A reconstruction of our present building of stone and brick will give us new and larger quarters. Our business in the meantime has not been interrupted, nor will it be."

CANADIAN NOTES.

(From our Ottawa Correspondent.)

Manager Walbank, of the Lachine Rapids Hydraulic & Land Company, Montreal, announces that it is the intention of his company to tender for the contract for lighting the streets of Montreal.

Although the bill to increase the stock of the Canadian Bell Telephone Company from five million dollars to ten millions, passed the Senate committee on Banking and Commerce without serious amendment, it was nevertheless, hotly contested in the Senate itself by those Senators who were determined that the company should be held down to the clause inserted in its charter in 1892 compelling the company not to raise its rates above what they were in that year. The demand is a most unusual one, but those who supported it claim that the company has received favors of the greatest value from Parliament, and that, in view of the handsome profit its business nets, it owes this much to the public. In consequence, however, of the determined opposition to the bill and the lateness of the Parliamentary session, Senator Kirchoffer asked leave to withdraw the bill for this year. He intimated that the company would endeavor to reach an understanding with the opponents of the measure during the Parliamentary recess.

How to Get to the Exposition After Reaching Buffalo.

The Buffalo Street Railroad officials express confidence in their facilities for handling the Pan-American crowds this summer.

New tracks have been laid on Elmwood avenue north of Forest avenue, and near the West Amherst Gate passenger depots have been erected and switches put in. The officials have been kept busy arranging routes and schedules. Extensive accommodations for handling large traffic are now ready at the East and West Amherst Gates.

A new line, running direct to the grounds, has been opened. This line, called the Jefferson, starts from the Erie and Central Stations and proceeds to the grounds via Jefferson and Main Streets, Florence, Parkside and Crescent avenues, unloading at the east gate. Other lines will be placed in operation as soon as the officials feel that this is justified by the traffic.

The Terminal Station, where the trains of the different steam railways discharge their passengers at the north of the Exposition grounds, permits of every facility for passengers who will be landed there. Eight tracks have been laid and there are five covered platforms, so that a number of different trains can be run into the station at the same time, and this will often occur, as several roads come into the station, and on big days during the summer when there are many excursions, the traffic at this point will be very heavy. It is but a few steps from this station through the Railway Exhibits Building and the great arches of the Propylaea to the beautiful Plaza whence the visitor entering from the north obtains his first general view of the Exposition.

Exports of Electrical Material from New York.

The following are the exports of electrical material, from the port of New York, for the week ended May 15:

Antwerp, 47 cases, \$6,875; Alicante, 18 cases, \$398; Argentine Republic, 16 cases, \$871; 5 packages, \$1,015; Athens, 60 packages, \$5,309; Australia, 211 packages, \$27,745; Barcelona, 26 packages, \$594; Berlin, 1 package, \$20; Brazil, 33 packages, \$1,896; British East Indies, 83 packages, \$2,755; British West Indies, 1 case, \$10; Cadiz, 14 packages, \$200; Central America, 212 packages, \$744; Chili, 16 packages, \$346; Cuba, 61 cases, \$437; Dublin, 4 cases, \$59; Dunkirk, 1 case, \$125; Dutch Guiana, 1 case, \$25; Dutch West Indies, 13 packages, \$260; French West Indies, 1 case, \$12; Gijon, 2 packages, \$117; Glasgow, 30 packages, \$8,764; 2 cases, \$60; Hamburg, 50 packages, \$4,316; Havre, 31 packages, \$1,012; Hayti, 2 cases, \$58; Helsingfors, 3 packages, \$773; Liverpool, 448 cases, \$21,595; London, 671 packages, \$77,024; 85 rolls electric cable, \$29,646; 21 motor cars and parts, \$4,950; Manchester, 11 packages, \$1,175; Marseilles, 8 cases, \$262; Mexico, 63 packages, \$1,082; Munich, 1 crate, \$500; Newcastle, 3 cases, \$500; New Foundland, 10 packages, \$251; New Zealand, 18 packages, \$1,204; Norwich, 1 case, \$300; Nova Scotia, 21 packages, \$273; Peru, 103 cases, \$9,241; 16 packages, \$1,522; Riga, 5 packages, \$1,779; Southampton, 1 case, \$20; U. S. Colombia, 17 packages, \$2,330; Venezuela, 35 packages, \$527.

PERSONAL MENTION.

Mr. F. Hild, formerly of Schenectady, N. Y., is now in Chicago, where as construction engineer for the General Electric Company he will superintend some work in connection with the construction of an electric road between Chicago and Joliet.

Mr. T. H. Mack, contract agent for the New York Telephone Company, has resigned his position on account of ill health.

COMMERCIAL PARAGRAPHS.

Longmans, Green, & Co., 91 Fifth avenue, New York, has recently issued a most interesting book by William J. Hopkins, entitled "Telephone Lines and Their Properties." This work, which is fully illustrated, contains some 300 pages of matter that should prove of great service to the telephone engineer. A list of books may be obtained by addressing the company as above.

"Motorettes."

The De Dion-Bouton "Motorette" Company, Brooklyn, N. Y., has recently installed a private nickel plating plant. This equipment comprises a number of novelties of interest to the trade. The dynamo is driven by a 3½ hp. water jacketed De Dion motor (belt connected). The gasoline tank is placed just above the motor, the vaporizer occupying its usual position to the left.

5 HP. DE DI ON MOTOR-DE IONER WAGON.

The exhaust is fitted to a standard 3/4 muffler placed outside, connected by a steel tube. The water jacket is connected to the regular water main via a 1/2" copper tube.

Two vats are already in place and doing service, but provision is being made for several others. Those now used are of different sizes, the larger vat being 6' long by 28" in width and 18" in depth. The smaller vat is 4' long by 18" wide and 16" deep.

It is not generally known that the "Motorette" works are driven by a gas motor, but such is the case. This

No. 1 NEW YORK TYPE MOTORETTE.

engine is of 25 hp., and a similar one reached the works last week and will be installed at once. This plan of equipping the plant with gas engines follows a similar custom at the De Dion works in Puteaux, France, where 3,000 men are employed.

Probably no concern in this country carries a larger assortment of small and large springs of every description than the Wallace Barnes Company of Bristol,

Conn. Some of the types of springs manufactured by this concern are shown in the accompanying illustrations. The company makes a specialty of motor springs

and special shapes are furnished when desired. Persons interested may obtain catalogue "W," which is illu-

strated and contains a vast amount of useful information, free of charge, on request.

A Bit of History.

The Hartford Steam Boiler Inspection and Insurance Company, the pioneer boiler inspection and insurance company of this country, and the largest company of the kind in the world, was chartered in the spring of 1866.

Its object is the prevention of boiler explosions by thorough periodical inspections of the boilers, protection of life, limb, and property, and dissemination of scientific information upon all questions relative to construction and management of steam boilers and steam appliances generally.

The company aims to keep pace with the best engineering practice of the day, and have its recommendations embody that which has been tried and proven good.

Its capital (fully paid) is \$500,000, with assets, on

January 1, 1901, of \$2,701,027.06, having a surplus, as regards policy-holders of \$1,121,740.85, and it has returned to its patrons in losses paid, and inspections the sum of \$6,090,108.67.

The Norton Electrical Instrument Company, Manchester, Conn., whose advertisement will be found elsewhere in this issue, reports that there is a constantly growing demand for its voltmeters and ammeters, so much so that the factory has to be kept running almost day and night. Electrical engineers interested in this line of goods may obtain an illustrated catalogue and price list free of charge by addressing the company as above.

Elsewhere in this issue will be found the advertisement of the Process Copper and Brass Company of Jersey City, N. J. As will be seen, this concern which makes copper castings by a new process, has supplied such castings to the leading electrical concerns of the country. The company makes trolley wheels, and cast trolley wheel bushings, wire couplers, rail bonds, commutator bars and other electrical devices.

We illustrate below a few of the specialties of the Smith & Hemenway Co., of No. 296 Broadway, New York City. The first illustration shows their No. 715

Swedish Lineup's Clamp. This is made from the celebrated Electro Boracic Steel, is beautifully finished and polished throughout. It is made with rounded corners, the advantage being that it can be carried in the pocket without tearing the clothes.

The next illustration shows one of the latest additions, the Meister Angular Boring Machines. This is a

very popular article and can run or bore at angles heretofore impossible. It is strongly made of fine appearance and runs perfectly true and is absolutely indispensable to telephone manufacturers, manufacturers of switchboards and electricians. Being able to bore at right angles it is possible to bore in deep and narrow places.

The third illustration shows the No. 90 Patented Royal Blue Side Cutting Plier. The advantage of

this tool is that the jaws are interchangeable and reversible, thus saving a large expense to the user. When the jaws become worn, they can be taken out and reversed by placing the lower jaw in place of the upper and the upper jaw in place of the lower.

Anyone interested in hardware would do well to write for the Green Book of Hardware Specialties issued by the above company.

INCORPORATIONS.

The Coal City Electric Railway Company, Marion, Ill.—to operate street railways and electric plants. Capital stock, \$100,000. Incorporators: P. M. Johnson, Frank P. Read and C. M. Atterbury.

The G. & E. Electrical & Construction Company, Binghamton, N. Y. Capital stock, \$12,000. Directors: W. H. Gaylord, Fred Eltapenc and E. Isherman, all of Binghamton.

The American Street Car Transportation Company, New York City—to deal in street car traction, railroad and ferry tickets. Capital stock, \$100,000. Directors: Andrew Bitt-

ner, New York City; T. W. Bolla, Jr., Glen Cove, and Katherine M. Storm.

The Hawey's Lake Miniature Electrical Railway & Light Company, Burlington, N. J. Capital stock, \$100,000. Incorporators: Edward Schwabenland, Riverside, N. J., and Howard Flanders, Burlington.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED MAY 14, 1901.

ELECTRIC RAILWAYS AND APPLIANCES.

674,109-674,109-674,110. Electric-Railway System. Benjamin W. Tucker, Newark, N. J. Filed Jan. 30, 1901, Feb. 9, 1901, Feb. 7, 1901.

674,340. Car-Fender. Archie W. Lindsey, Atlanta, Ga., assignor of one-half to Charles C. Chillingworth, same place. Filed Dec. 14, 1899.

ELECTRIC LIGHTS AND APPLIANCES.

673,935. Electric-Lighting System. Alexander J. Wurtz, Pittsburg, Pa., assignor to George Westinghouse, same place. Filed April 21, 1899.

673,951. Electric-Arc Lamp. John Herricht, Cleveland, O., assignor of one-half to Gustav Walther, same place. Filed Dec. 26, 1900.

674,067. Electric-Arc Lamp. William H. Northall, Elwood, Ind., assignor to the Lea Manufacturing Company, same place. Filed Jan. 18, 1900.

674,130. Electric-Arc Lamp. Tapley W. Young, Washington, D. C., assignor of one-half to Annie Campbell, same place. Filed Aug. 4, 1900.

674,151. Shade-Holder for Electric Lamps. Lewis J. Atwood, Waterbury, Conn., assignor to the Plume and Atwood Manufacturing Company, same place. Filed Oct. 31, 1898.

674,283. Electric-Lamp Socket. John D. Pierce, Philadelphia, Pa. Filed May 21, 1900.

674,338. Electric-Arc Lamp. John Herricht, Cleveland, O. Filed Aug. 27, 1900.

ELECTRICAL MACHINERY AND APPARATUS.

673,910. Controller for Motors. Christian W. Kragh, Madison, Wis., assignor to the Northern Electrical Manufacturing Company, same place. Filed April 14, 1900.

673,911. Polyphase Alternating-Current Motor. Benjamin G. Lamme, Pittsburg, Pa., assignor to the Westinghouse Electric and Manufacturing Company of Pennsylvania. Filed Jan. 30, 1899.

673,980. Electromagnet-Motor. Louis H. Englehardt, Everett, Mass., assignor of one-half to Harry M. McNelly, same place, and Mark Gallert, Waterville, Me. Filed June 22, 1900.

674,080. Electric Igniter for Explosive Engines. William G. Stoltz, Brooklyn, N. Y. Filed Feb. 5, 1901.

674,076. Electric Switch. Cummings C. Chesney and Herbert W. Smith, Pittsfield, Mass., assignors to Stanley Electric Manufacturing Company, same place. Filed July 23, 1900.

674,207. Electric Switch. Joseph C. de Janisch, Paris, France. Filed April 27, 1900.

MISCELLANEOUS.

673,900. Electric Battery. David H. Darling, Jr., New York City, assignor to the United States Battery Company, same place. Filed Oct. 11, 1899.

673,908. Electric Cable. John D. Gould, Brooklyn, N. Y. Filed April 6, 1898.

673,912-673,913. System of Electrical Distribution. Benjamin G. Lamme, Pittsburg, Pa., assignor to the Westinghouse Electric and Manufacturing Company of Pennsylvania. Filed July 14, 1900.

673,952-673,953. Asymmetrical Electrical Conductor. Leo W. Hildburgh, New York City. Filed Nov. 22, 1897, April 24, 1899.

674,018. Electrical Contact Device. Miner Robinson, Newton, Mass. Filed Jan. 31, 1901.

674,020. Igniter or Circuit-Breaker. William G. Stolz, Brooklyn, N. Y. Filed Feb. 5, 1901.

674,106. Battery-Cell. Edward Tiquet, Romford, Eng. Filed Jan. 9, 1901.

674,124. Electric Heater. Conway Robinson, Baltimore, Md. Filed April 17, 1899.

674,289. Electric Clock-Winding Mechanism. Victor Odquist, Chicago, Ill., assignor to Albert Tuerk, same place. Filed June 25, 1900.

674,333. Coin-Controlled Electromedical Battery. Jacob G. Hartman, Baltimore, Md. Filed Jan. 24, 1900. Renewed Oct. 17, 1900.

DESIGNS.

34,502. Case for Electrical Measuring Instruments. Frank W. Roller, New York City. Filed March 30, 1901. Term of patent 7 years.

34,503. Insulating-Block for Electric Lamps. Irving E. Brown, Providence, R. I., assignor to Providence Gas Burner Company, same place. Filed April 5, 1901. Term of patent 14 years.

THE TELEPHONE WORLD.

Model Telephone Exchange at the Pan-American.

The Model Telephone Exchange is now in working order in the Electricity Building. It is so placed that all the mystery of the business is exposed. Visitors can see the apparatus from all sides. There are 72 'phones on the switchboard, and they reach every part of the ground, being supplied free to the police, fire and other departments of the Fair. Several have been put in the press headquarters, and are available at all hours for the free use of the newspaper men. The system was installed by Engineer Paul M. Krahmer, who went to Buffalo a month ago and drove the first stake. The system in use is that for which a franchise is being sought by a Buffalo company to compete with the Bell Company. The machinery is made by the Stromberg-Carlson Telephone Company of Chicago. The 'phones are automatic, and there are lights to signal a call and to disconnect.

For some months there has been a bitter fight on in Boise City, Idaho, between the Rocky Mountain Bell Telephone Company and the Independent Telephone Company. The former is the old established concern of that section, with long-distance lines in every direction; the latter is a new corporation, composed of local capitalists, and the fight becomes more interesting every day. The Bell people lately notified the public that it was making straight two year contracts for 'phones, and that upon signing one of these the subscriber was presented with a receipt in full for the first year's charges. The Independent people have made no counter move in this line as yet. An alternative writ of mandamus has been issued against the Oregon Short Line Company, returnable at once if it does not allow the installation at its depots of Independent 'phones, the latter company having tried time and again to make such installation 'phones to be put in and maintained free of charge, but the railway has invariably refused. The manager for the local company claims that the railway people are influenced by the Bell. The Independent people say they will fight to the bitter end, and they seem to have a great many people with them. The great drawback to their system is lack of long-distance lines.

The annual stockholders' meeting of the Rockingham, Va., Mutual Telephone system, was held recently. David D. Showalter was reelected president, and John A. Wenger, secretary and treasurer. The annual fee for switchboard service was increased from \$2 to \$3. More than 1,100 'phones now enter the switchboard in Harrisonburg, Va. Outside of town the 'phone-holders own the lines and instruments and the system is on a purely mutual basis. The \$3 fee is the only fixed charge for service. In the town of Harrisonburg subscribers pay \$8 and \$15 respectively for residence and business 'phones. Rockingham is said to have a complete and cheap rural telephone service.

The Secretary of State recently chartered the Lattimore Telephone Company of Lattimore, N. C., with a capital stock of \$1,350. The stockholders are S. S. Royster and D. D. McBrayer of Moonsboro, and J. H. Jones of Lattimore. The company has all the privileges and powers usually conveyed to corporations of the kind.

The New York Telephone Company has bought from Banker James Loeb, of Kuhn, Loeb & Co., the eight-story business building, with plot, 50 x 100, Nos. 53 and 55 Franklin street, in this city. The structure is known as the Eagle Building, and is occupied in part by the Telephone Company as its Franklin street exchange.

The Belmont Telephone Company will commence shortly to put up its poles in Martin's Ferry, O. The only delay is the non-arrival of a sufficient number of poles to keep the men at work. It expects to have the 'phones in operation by July 1, as the contracts call for.

The citizens of Bettsville, O., have concluded that they have been behind the times long enough, and are making arrangements to have a telephone exchange installed in their village. F. E. Vorheis, of Gibsonburg, O., is behind the project and will have charge of the work. It will be an independent exchange.

Representatives of the Berks County Telephone Company met a short time ago at the office of Charles C. Kurtz and dissolved the corporation. The company had intended to operate in Reading, Pa., but failed to secure the desired franchise.

The Century Telephone Constructing Company, which recently secured a franchise in Elmira, N. Y., is endeavoring to secure a franchise in Ithaca, of this State.

Telephone Evolution Promised in Chicago

According to the New York "Commercial," Chicago may look for more than an evolution in the methods of its telephone business when Mr. Sabin has full charge, and perhaps "revolution" would better express the radical changes he will make in the systems, the prices, the management, etc. He proposes to eliminate the obsolete methods in use in Illinois and Iowa, and to substitute the newest appliances. Mr. Sabin recently said:

"As superintendent of the Iowa, Chicago and Central Union Telephone Companies I will have general supervision over all the telephone systems in Illinois, Indiana, Iowa and Ohio, with the exception of the systems in Cleveland and Cincinnati. There are five times as many telephones in the California system as in Iowa, Illinois, Indiana and Ohio. Here we have under 3,000,000 people and there 18,000,000.

"In San Francisco we have 25,000 telephones, 10,000 of which have been put in in the past two years. This has been done by popularizing the 'phone through the nickel in the slot attachment. Any one who can afford gas in his house in San Francisco can afford a 'phone. It is the graduated cost that has made us grow. Now the area in the East to be covered by the three companies is but one-third as much as the coast, and the people there are more compactly settled."

"With these conditions prevailing there is an immense field for development and progress. The interests of the several telephone companies over which I have control are not consolidated, but are as separate as before my appointment as president of the directors."

On May 15 the police of Trenton, N. J., discovered that of the several thousand pounds of copper telephone wire stolen, which has effectually shut off talk between that city and Philadelphia, 2,000 pounds of wire was cut from the Bell Company's circuit near Burlington. The "wire gang" has been at work throughout New Jersey and the thieving has tied up more than one branch of the suburban trolley and telephone lines recently. The men usually cut the wire close to the poles, and dressed as linemen. Frequently work in broad daylight without the slightest interference. Communication by telephone between Trenton and Philadelphia has been impossible for some time, because of the wire thieves' activity, except by the roundabout way over the Doylestown circuit. Rewards are offered by the trolley and telephone companies for the capture of the wire thieves, and if caught in New Jersey a full measure of justice is promised.

Representatives of the People's Telephone Company have been in Victor, N. Y., securing the right of way through that town for the erection of poles and the stretching of wires. This company's line is in successful operation in the southern part of Western New York and is proving a formidable rival to the old established line because of its lower rates and better service. A branch line will also be built from Victor to East Bloomfield over the Boughton Hill road. This is proving a great accommodation to residents of rural districts, connecting their homes with those of their friends, and with the surrounding country, giving them about as good service as if they lived in the city. The company expects to commence the erection of the line immediately.

At a recent meeting of Murdock, Minn., business men and farmers living north of that town, the Murdock-Carlson Telephone Company was organized by the election of the following officers: President, C. H. Fredrickson; vice president, L. H. Lawson; secretary A. L. Bergstrom; treasurer, John Brandt. The object of the organization is the construction of a telephone line from Murdock to Carlson, a distance of ten miles north.

The Northwestern Telephone Company asks for permission to put up poles and wires for a new telephone in Brainerd, Minn. It agrees not to exceed \$2 per month for office 'phones and \$1 a month for residences. The present price paid the local telephone company is \$3 and \$1.50 respectively. The matter will come up for action at the next regular meeting of the council.

The People's Telephone Company, which was recently granted a franchise to operate a telephone exchange in Lynn, Mass., has filed its bond for \$10,000, with the city clerk. This bond is to insure the carrying out of the agreement with the city according to the provisions of the franchise granted. The engineering department of the company will shortly commence work on the plans for construction work.

The Burton, O., Telephone Company has increased its capital stock from \$5,000 to \$15,000.

Proposals for Furnishing Underground Telephone and Telegraph Cables.

Sealed proposals will be received at the office of the Commission, Washington, D. C., until 12 o'clock M. Saturday, June 1, 1901, for furnishing underground signal and telephone cables for the fire alarm and police telegraph and telephone service in the District of Columbia. Separate bids will be considered for the several items enumerated. Specifications and blank forms of proposals may be obtained at that office. H. B. F. Macfarland, John W. Ross, Lansing H. Beach, Commissioners, D. C.

The United States Telephone Company will build simultaneously with the Everett-Moore Detroit & Jackson work a toll line from Detroit to Pontiac, Mich., and from Holly, which is already connected with Pontiac to Corunna, with a branch line from Fenton to Flint. These lines will afford a straight connection between Saginaw, Bay City and Saginaw Valley, and nearly straight connections between Detroit and Grand Rapids.

An independent telephone company is being organized at Redkey, Ind. The stockholders, business men of the town, have subscribed \$2,500 in \$25 shares. The purpose is to connect with independent exchanges in other towns, and help fight the Central Union.

Three telephone companies are competing for business in Spencer, Ind. Each of the local companies has about 100 subscribers, and there are 600 telephones in Owen County connected with them.

The Dayton & Troy, O., Electric Railway Company has changed its charter so as to enable it to conduct a telephone and electric lighting business and to make traffic arrangement with other roads.

Tallapoosa, Ga., is now connected with the outside world by telephone, as the Gainesboro, Tenn., Telephone Company of the Georgia division has finished putting up its wires.

Work on the new telephone line from Maine Prairie to Kimball, Minn., has commenced. Dr. Shercourt, it is understood, is backing the enterprise.

TELEPHONE INCORPORATIONS.

The Farmers' Telephone Company, Janesville, Wis. Capital stock, \$2,100.

The People's Telephone Company, Chillicothe, Ill. Capital stock, \$1,000. Incorporators: B. F. Zinzer, Howard L. Pettet and W. D. Kelly.

The People's Telephone Exchange, Yates City, Ill. Capital stock, \$2,000. Incorporators: W. G. Lehman, O. B. West and L. D. Fletcher.

The Independent County Telephone Company, Polo, Ill. Capital stock, \$30,000. Incorporators: B. W. McHenry, W. P. Graham and A. B. Sheadle.

The Galt Telephone Company, Galt, Mo. Capital stock, \$2,400. Incorporators: Robert Willis, J. T. Hudson, G. M. Bennett and others.

The Sharpsburg Home Telephone Company, Sharpsburg, Ky. Capital stock, \$3,500. Incorporators: B. T. Wright and R. A. Atkinson.

The Hancock County Telephone Company, Hawesville Ky. Capital stock, \$3,000. Incorporators: I. C. Adair, Louisa Adair and W. E. Ford.

The Ellis County Telephone Company, Waxahachie, Tex. —to run telephones between the towns of Ray, Howard, Maloney, Nash and Avaton. Capital stock, \$2,000.

The Jackson County Telephone Company, Newport, Ark. Capital stock, \$2,000. Officers: John W. Ferrell, president; R. K. Fitzhugh, vice-president; B. B. Bond, secretary and treasurer.

The Minnesota Rural Telephone Company, Princeton, Minn. Capital stock: \$50,000. Incorporators: Louis Rust, Edward L. Saxton, Clarence T. Johnson, all of Princeton, and Louis Erickson and Andrew E. Westling of Wyanette.

The Commercial Telephone Company, San Antonio, Tex. —to maintain a telephone system in the counties of Orange, Jefferson, Liberty, Harris, Galveston, Fort Bend, Austin, Wharton, Colorado, Fayette, Caldwell, Guadalupe, Gonzales, Bexar, Lavaca, Washington, Burleson, Milam, Robertson Falls, Limestone, Navarro, Ellis and Dallas. Capital stock, \$500,000. Incorporators: Z. B. Campbell, H. M. Aubrey of San Antonio, J. E. Boynton, Waco; C. M. Haskell, Ottawa.

GENERAL ELECTRICAL NEWS.

Lighting.

Albany, Ga.—An election will soon be held to vote on the question of issuing \$25,000 in bonds to build an electric light plant here.

Bessemer, Ala.—It has been decided to issue \$40,000 in bonds for the erection of an electric light and power plant at this place.

Coeymans, N. Y.—Alden Nodine has been surveying the town with a view to establishing an electric light plant in the near future.

Delray, Mich.—Dr. F. J. Clippert and Superintendent C. E. Lyon of the Michigan Carbon Works will ask the Delray council at its next meeting for a gas and electric lighting franchise.

Denton, Md.—The Hughes Lumber & Coal Company contemplates building an electric light plant.

Dyersburg, Tenn.—On June 1 the mayor and aldermen will receive bids on granting a 20 year franchise on a water and electric light plant to be put in the city. W. A. Fowlkes, mayor.

Kenton, O.—The People's Heat & Light Company of this city was lately incorporated with \$100,000 capital stock. This company will erect an electric light plant to compete with the Kenton Gas & Electric Company.

Lancaster, S. C.—A Northern company has made a proposition for erecting an electric light plant here.

Lebanon, N. J.—It is proposed to bond the town for \$15,000 for the purpose of establishing an electric light plant.

Longview, Tex.—The electric light plant in this city was destroyed by a recent fire, causing a loss of \$2,500.

Madison, Wis.—A bill providing for a State electric lighting plant for the Capitol Building was recently passed by the Senate. The bill authorizes the Governor to contract for the construction of such a plant and appropriates \$35,000 for the purpose.

Mattoon, Ill.—Extensive additions are to be made to the Mattoon Heat, Light & Power Company's plant; also new machinery is to be installed. About \$25,000 will be expended in improvements.

Milan, Tenn.—The public electric light plant here is to be improved.

Oshkosh, Wis.—The Oshkosh Electric Light & Power Company will rebuild its entire plant at a cost of about \$50,000, as soon as the city lighting contract is awarded.

Parsons, W. Va.—The Parsons Electric Light & Power Company has been incorporated by H. K. Grubb, W. G. Conley and others. An electric light plant will be erected for which H. K. Grubb has received a franchise. Address W. G. Conley secretary.

Pipe Stone, Minn.—The Pipestone Electric Light, Heat & Power Company a short time ago filed articles of incorporation with the Secretary of State. It has a capital stock of \$50,000. The officers are D. J. Nerney, president; J. F. Conklin, vice-president; F. P. Wilson, secretary and treasurer, all of Minneapolis.

Ravenswood, W. Va.—This city is preparing to erect an electric light plant.

Richmond, Ind.—J. M. Westcott, will lend this city \$100,000 for an electric light plant.

Santa Paula, Cal.—The citizens are agitating the question of erecting an electric lighting system.

Shepherdstown, W. Va.—This city has voted to issue \$4,000 in bonds to erect an electric light plant.

Terre Haute, Ind.—Geo. McL. Johnson, senior member of the L. B. Root Company, contemplates the erection of an independent private electric light plant.

Trevorton, Pa.—The citizens have almost subscribed \$7,000 for stock in the electric light plant to be established here.

Utica, Ill.—This place will have an electric light plant, which will be operated by a 75 hp. engine.

Van Etten, N. Y.—The citizens of this place are agitating the erection of an electric light plant in this village.

Washington, D. C.—The Indian Bureau has about completed plans for the new heating and electric lighting plants for the Fort Totten, N. D., Indian school, for which \$18,000 was appropriated by Congress.

Street Railways.

Brazil, Ind.—Messrs. W. R. Risher, C. McGaughey and G. W. Robinson have petitioned the county commissioners for a right of way over the gravel roads north to Caseyville for the construction of an electric street car line.

Denver, Col.—The proposition to erect a tramway system to bring down the ores of Gilpin and Clear Creek Counties to this city and intermediate points for treatment meets with decided approval among the miners interested, as it is conceded that it will be of great benefit; insuring more prompt delivery, cheaper transportation and quicker returns to the miners. An electrical engineer will soon undertake the work of investigating the ore situation in order to ascertain what amount of business can be relied upon for the system.

Fairport, N. Y.—The Fairport Electric Railway Company was incorporated last week with a capital of \$110,000 to construct an electric road 11 miles long between and in this place and Rochester.

French Lick, Ind.—Dr. George S. Gagnon of New York expects to build two large hotels at French Lick and West Baden, and an electric railroad connecting two towns which are one mile apart. He will also build a running course. The enterprises contemplate an investment of \$1,500,000. The doctor has secured 230 acres between the two towns, and will build an electric railroad on his own land.

Galesburg, Ill.—The People's Traction Company of this city has been incorporated with \$10,000 capital stock by F. W. Latimer, L. W. Sanborn and others.

Hamilton, O.—Dr. S. T. George of Dayton, president of the new Ft. Wayne, Dayton & Cincinnati Electric Traction Company, has lately been in Hamilton procuring options on property for a right of way between this city and Cincinnati. The road is to be 320 miles long. D. W. Lafetra of New York is at the head of the syndicate furnishing the capital for the enterprise. The company is incorporated under the laws of South Dakota with \$4,500,000 capital stock.

Hempstead, N. Y.—The Mineola, Hempstead & Freeport Traction Company has obtained from the trustees a franchise to build a trolley road through the village to connect with the proposed line to Queens. The company will commence the work of construction before August 1.

Hopedale, Mass.—At a recent meeting here of President John T. Manson of the Milford, Holliston & South Framingham Street Railway Company, and the directors of the Grafton & Upton Railroad Company, plans were perfected so that the steam road will be equipped and run by electricity.

Janesville, Wis.—The Janesville city council has granted an electric railway franchise to the Janesville-Rockford line.

Kalamazoo, Mich.—The Kalamazoo & Lake Michigan Electric Railway Company has increased its capital stock from \$60,000 to \$200,000.

Port Clinton, O.—The latest rumor in the way of electric railroad news is that of a project on foot to construct a line from Toledo to this place as near the shore of the lake as possible.

Utica, N. Y.—The Cleveland syndicate, which recently purchased the street railroad properties in this city, has bought the Herkimer, Mohawk, Ilion & Frankfort Street Railroad. The Utica road will be extended to Frankfort and to Rome, rails being now on hand for that purpose. The link just purchased is seven miles long and fully equipped. It is an important move in the scheme to parallel the Central Hudson from Albany to Buffalo with a double track electric line.

Wilkes-Barre, Pa.—The Wilkes-Barre & Hazleton Railroad Company, composed of the leading spirits of the Lehigh Traction Company, owning electric lines in Hazleton and vicinity, purposes building a traction line between Hazleton and this city. It is to be about 25 miles long.

Zanesville, O.—The county commissioners have granted an electric railway franchise to G. K. Browning, representing Eastern capitalists, from this city to Hebron along the National road.

Manufacturing.

Atlantic City, N. J.—The Ernest W. Naylor Engineering Company, capitalized at \$100,000, has been formed here to manufacture electrically controlled engine valves.

Boston, Mass.—George O. Proctor, Guy H. Proctor and Charles H. Pease are the promoters of the New England Electric Manufacturing Company, capitalized at \$30,000.

Cleveland, O.—The United Electric & Manufacturing Company of this city, with a capital of \$10,000, was lately incorporated by Thomas Sheehan, C. J. Estep, Ira Culver, M. F. Parrett and W. L. West.

Greenville, Miss.—The Delta Electric Light, Power & Manufacturing Company, capitalized at \$50,000, was chartered here a short time ago. Henry Crittenden, Arthur Hider, C. Jaeger, W. E. Hunt, F. Geardina, Angelo Corroero and Alfred Shields are the interested parties.

Philadelphia, Pa.—The American Electrical Manufacturing Company of this city, with a capital of \$300,000, has been organized.—Sparks from a neighboring chimney set fire to the building of the Scott & Janney Electric & Manufacturing Company last week, causing a loss of \$1,000.

Company Matters.

Albert Lea, Minn.—The stockholders of the Albert Lea Electric Company have voted to increase the capital stock from \$100,000 to \$200,000.

Chicago.—The Marshall Electric Company has changed its name to the J. S. Richards Manufacturing Company, also the location of its principal office from Marshall to this city.

Reading, Pa.—I. J. Lerch has purchased from J. K. Righter the stock and good will of the Reading Electrical Construction Company, and will form a company, to be known as the Pennsylvania Electric Company. It will be an auxiliary to the People's Company and will establish a general electric and construction business.

Power and Transmission.

Boise City, Idaho.—Fast upon the success of the Trade Dollar Company in its great water power scheme on Snake River come a number of similar projects, all tending to utilize the hitherto unused waters of the State. The latest and one of the many feasible is that by Judson Spofford and associates to create some 2,000 horse power from the waters of the Payette River, with which to furnish electric power and light to the mines at the Pearl camp and power for this city.

East Liverpool, O.—Within the next four months upwards of \$5,000 will be spent for improvements to the plant of the United Power Company, located here.

Automobiles.

Carlisle, Pa.—A company in which E. J. Pennington of Philadelphia is interested, is being organized here to manufacture automobiles.

Haverstraw, N. Y.—The Haverstraw Auto-Service Company will operate a stage route in Rockland County through the towns of Haverstraw, Stony Point and Clarkstown with a capital of \$10,000. George P. Hilton and Hershel Roberts of Albany, and Charles M. Hilton of Haverstraw, are interested in the concern.

Newport, R. I.—E. C. Hayward, manager of the Newport branch of the New England Electric Vehicle Transportation Company, has opened the Newport branch for the season. It is reported that the company will not rent electric machines this summer, but will sell and care for them.

Youngstown, O.—The Church Automobile & Specialty Company, a corporation composed almost exclusively of Pittsburgh people, desires to locate in this locality and has in mind Youngstown as the most desirable point. The company is incorporated at \$125,000.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16½¢@16¾¢; Lake, 17¢@17½¢; casting, 16½¢@16¾¢.

The Canton, Massillon & Akron Railroad Company has increased its capital stock from \$1,000 to \$1,000,000.

The Kings County Electric Light & Power Company has declared the regular quarterly dividend of 1½ per cent.

April gross earnings of the Pittsburg Consolidated Traction Company increased \$4,460, while net earnings decreased \$7,612.

Boston Elevated people speak highly of the "Sprague multiple unit control" now in use on the Elevated lines. They say that the Sprague apparatus is working perfectly.

The Union Railway Company of New York reports for the quarter ended March 31: Gross earnings, \$194,091; expenses, \$144,916; net, \$49,145; charges, \$33,912; surplus, \$15,233.

Metropolitan Elevated of Chicago is understood to be out of the arrangements for consolidation. The supposition is that some Metropolitan interests regarded the Lake Street load as too heavy.

The Gas & Electric Company of Bergen County, N. J., reports for April: Gross earnings, \$18,047; operating expenses, \$11,855; net earnings, \$6,192; from June 1, 1900, to April 30, 1901, gross earnings, \$216,933; operating expenses, \$138,184; net earnings, \$78,749.

The following are quotations for some of the industrial stocks not quoted elsewhere: Electrical Lead Reduction, 4½¢@5¢; Electric Boat, 14¢@17¢; Electric Vehicle, 10¢@12¢; Tel. & Tel. Company of America (full paid) 5¢@7¢; Electric Company of America, 9½¢@9¾¢; National Carbon, 15¼¢@16¢.

Progress is being made with the electrical equipment of the Manhattan Elevated system in this city and from this excellent results are expected. With open, swiftly moving cars, it is anticipated that the summer business, which is now comparatively small, can be kept up to the level of the winter months.

The proceeds of the proposed \$2,000,000 increase in the capital stock of the Bell Telephone Company of Philadelphia, which the stockholders will be asked to ratify at a meeting this month, will, it is stated, be expended chiefly on the Delaware & Atlantic system, owned by the Philadelphia Bell Company.

A dispatch from Boston states that the Attorney-General has rendered a decision that the bill permitting the consolidation of the Edison Electric Illuminating Company and the Boston Electric Light Company does not conflict with the bill permitting similar consolidations when sanctioned by the Gas Commissioners.

Some very conservative people who have hitherto not been identified with movements in Brooklyn Rapid Transit now announce themselves bullish on the stock. Competent authorities say the physical condition of the property is excellent and the company is strong in funds without material increase in annual obligations.

The American Light & Traction Company, which was incorporated at Trenton, N. J., in April for \$2,000, has increased its capitalization to \$400,000. There will be issued preferred stock to the amount of 250,000 shares, valued at \$25,000,000, and common stock to the amount of 15,000,000 shares, valued at \$15,000,000.

The Atlantic Wireless Telegraph & Telephone Company was incorporated on May 16 by Richard P. Simpson, Robert E. Lee Cunningham, Harry B. Cook, William F. Taylor, William I. Cook, Charles H. McDonnell and William Byrne. The stated capital is \$5,000,000, divided into 5,000,000 shares of \$1 each. It is said that the promoters of the company have the rights for the Marconi system in Maryland, the Virginias and the Carolinas.

After the meeting of the American Telephone & Telegraph Company directors on May 15 in Boston it was announced that Mr. T. B. Bailey had resigned to make room on the board for Mr. F. P. Fish, the new president. Mr. Bailey is purchasing agent for the company. The fact that the session was an unusually long one has led to the impression that something besides "routine" business was transacted. There are strong intimations in banking circles that an additional issue of stock is shortly to be announced.

The Boston "News-Bureau" states that it is probable that the shareholders of the General Electric Company will shortly receive valuable rights in connection with the readjustment of the capital stock of the company. The new board of directors is as follows: Gordon Abbott, Oliver Ames, C. A. Coffin, T. Jefferson Coolidge, Jr., Frederick P. Fish, George P. Gardner, Eugene Griffin, Henry L. Higginson, J. Pierpont Morgan, J. P. Ord, Robert Treat Paine, 2d, George Foster Peabody and Charles Steele. The company has declared the regular quarterly dividend of 2 per cent. on its common stock, payable July 15 to stock of record June 14.

Both Electric Company of America and American Railways interests, who are participating in the consolidation negotiations, now say that the plan has been practically agreed to, and that it is likely to be in shape for announcement to stockholders this week. Under the plan the new company to take them over will have about \$12,000,000 4 per cent. collateral trust bonds and \$4,000,000 common stock. There will be no preferred stock. Besides the bonds which stockholders get in exchange for their present stock, they will be allowed to subscribe to \$2,500,000 additional bonds at par, and a 35 per cent. bonus in new common stock, for cash, issued to provide new cash capital. These bonds will be underwritten. The exchange of the 75,000 shares of the American Railways Company stock at 55 makes up \$4,125,000 of the new bonds, and the 400,000 shares of Electric Company of America stock outstanding takes up \$4,600,000, which together with the \$2,500,000 to be sold for cash makes a total of \$11,225,000 to be issued.

ELECTRICITY.

VOL. XX.

NEW YORK, MAY 29, 1901.

NO. 21.

ELECTRICITY

Published every Wednesday by the
ELECTRICITY NEWSPAPER COMPANY.

Publication Office, - - 136 Liberty St., New York.
Long Distance Telephone, 4081 Cortlandt.

SUBSCRIPTION RATES:

UNITED STATES, - - - - -	\$2.50
IN CLUBS OF FIVE OR MORE, - - - - -	2.00
FOREIGN COUNTRIES, - - - - -	4.50
SINGLE COPIES, - - - - -	10 cents

EDITORIAL NOTES.

The Twentyfourth Convention of the National Electric Light Association.

respect. The attendance was unusually large,
which was to have been expected in view of
the attraction at Buffalo.

The papers read and reports presented were
almost without exception of a high order of
merit and of a practical nature, and elicited
discussions that should prove of great value to
the industry. Among the reports and discus-
sions two that deserve special mention were
those on "The Standard Candle Power of In-
candescent Lamps," and on "Amendments to
Freight Classification of Electrical Apparatus."
These subjects were gone into in a most
thorough and exhaustive manner and were
discussed at great length.

The Pan-American Exposition was visited
by the members en masse and a number of
manufactories at the Falls employing electric
power were inspected. Taking it all in all, the
Twenty-fourth Convention will go down in his-
tory as a most instructive and enjoyable gather-
ing.

The proceedings will be found elsewhere in
this issue.

The Library of the Late Latimer Clark.

on the evening of May 21, Prof. Schuyler S.
Wheeler donated to the Institute library the
entire collection recently purchased by him
from the executors of the estate of the late
Latimer Clark, who was one of the founders
of the British Society of Telegraph Engineers
and its president in the year 1875.

The library contains 7,000 volumes, covering
practically every book treating of electricity
printed up to 1886. Many of the volumes are
so rare that special provision is made for their
preservation in the deed of gift by Prof.
Wheeler.

The general terms of the deed of gift, as
made public, are that the Institute shall pro-
vide a suitable place to keep the library, ap-

The Convention of
the National Electric
Light Association,
which has just drawn
to a close at Niagara
Falls, proved most
satisfactory in every

propriate \$1,500 a year for its care and that it
shall be free to the use of all, and open for use
upon some evenings and Sundays.

It is understood that just before sailing for
Europe Mr. Carnegie promised a member of the
Institute that if Dr. Wheeler gave the Clark
library he would give an equivalent amount of
money for the utilization of the treasure.

The Institute is certainly to be congratu-
lated that through the generosity of Prof.
Wheeler, it becomes possessor of a collection
of books that will prove invaluable to the elec-
trical fraternity. Such a library has been
much needed by the Institute, and will prove
invaluable as a means of reference and re-
search.

The Electrical Features of the Glasgow International Exhibition.

The exhibition which was
opened at Glasgow, Scot-
land, on May 2, and which
will close next November,
is now pretty well com-
plete, and engineers from
all parts of Great Britain
will be shortly flocking to the so-called "model
city" in fair numbers. The year's programme
of scientific and engineering societies' visits to
the city and exhibition is a very full one. The
fact that the Municipal Electrical Association
holds its three days' convention there in June,
the British Association its week's congress in
September, the joint convention of all British
engineering societies, including the Institu-
tion of Electrical Engineers, in the same month,
and sundry other societies between now and No-
vember next, indicates that the electrical and
engineering exhibits will be visited by the
very men with whom the manufacturer wants
to get into touch. In the "Machinery Hall,"
where nearly all the features of electrical in-
terest are to be found, the exhibits are mainly
of British origin, but there is a proportion of
Continental and American, although these con-
sist chiefly of machine tools. There is an ex-
cellent pavilion erected in the grounds by the
British Westinghouse Company with a repre-
sentative exhibit of their large gas engines
for driving electric generators, electric cars,
switchboards, motors, etc. There are several
other pavilions in the same neighborhood, one
containing some good specimens of the tools
made by the Bullard Machine Tool Company
of America, and one containing a full exhibit
of Schuckert machinery and material by the
British Schuckert Electric Company. It
would hardly prove of interest to American

electrical engineers to quote the names of the hundreds of firms who are represented nor to catalogue their various exhibits in detail. To an Englishman making a general tour round among them, says our London correspondent, there are signs of a far greater degree of enterprise than has sometimes been shown by British engineering firms when opportunities have arisen for them to keep themselves pushed well forward. The best electrical engineering firms show examples, some of them very large, of the best and most recent English electrical practice.

The Clarke-Stevenson long wall disk type of coal cutting machine, which is being used in quite a large number of English collieries is shown by the firm of Clarke, Stevenson & Co. The "Reavell" steam engine is one which has lately been pushed for electric lighting purposes, and it is shown driving a 50 kw. two-phase alternator of the Fowler Hall type. Messrs Reavell also exhibited electrically driven compressors. Messrs. Bruce, Peebles & Co. of Edinburgh have a 150 hp. electric driven motor driving a main shaft in the Hall, and among their exhibits are found water tight mining motors (60 B.H.P.), motor-driven capstans, the Peebles Willans' train lighting equipment, and Peebles-Belliss steam driven generators (350 kw.) for central electric lighting stations. The Fynn patent direct and alternating motors and generators are placed on view by Rosling, Appleby & Fynn, Ltd., and the Electrical Company, Ltd., who are the British representatives of the Allgemeine Electricitäts-Gesellschaft have a varied exhibit of electrical machinery and instruments. Fourteen clocks in different parts of the exhibition are driven electrically from the stand of Messrs. Barr & Stroud, which firm also exhibits range-finders for military and naval service, and electric ships telegraphs. Messrs. Dick, Kerr & Co., whose name can hardly be quoted apart from the English Electric Manufacturing Company, and the Electric Tramway and Carriage Works Company, whose very large works were so recently set running at Preston, has a quantity of electric traction material, large electric generators and motors, and so on, manufactured by these two companies.

Messrs. Mavor & Coulson have placed on view some electric plunger pumps, drilling and coal cutting machines, central station generators, their concentric wiring system and other things. Messrs. Duncan Stewart & Co., whose name is standing out somewhat prominently among English electric tramway engine builders in connection with the Glasgow and Kalgoorlie (West Australia) power stations have a noteworthy show, McCallum's patent internal combustion engine, which produces power by the direct combustion of coal without steam boilers, being its leading feature. The engine is being shown in operation for a short time daily. Electrically driven centrifugals and refrigerators are also shown by Messrs. Stewart.

Perhaps the two largest exhibits are those of Messrs. Clarke Chapman & Co. and Messrs. Mather & Platt. Neither is exclusively electrical but each covers a good deal of steam engineering equipments for a variety of classes of work. Electric generators, winches, polyphase motors, projectors, etc. are included at Clarke Chapman's, and multipolar and other electrical machinery for lighting, power and traction work are placed by Mather & Platt.

A 200 kw. three-phase alternator (5,000 v. pressure), built by the Lancashire Dynamo and Motor Co., is shown driven by a vertical compound inclosed engine made by Hick Hargreave & Co., whose name will be remembered as that of a successful tenderer for the now famous Glasgow tramway engine plant contract. A "Peel-Hawkins" standard multipolar dynamo is shown running coupled to a high speed "Peach" engine.

The Ericsson Telephone Co., who have supplied a number of instruments, etc., in connection with the municipal telephone system of Glasgow which has just been started, have a variety of interesting stuff, including specimens of the Glasgow apparatus. This is an exhibit which will interest municipal electricians this summer in view of the strong feeling in certain parts of England in favor of local municipal exchanges.

There is no doubt that many electrical engineers will find the plant which supplies the exhibition with its light and power of far more practical interest. Just off the Machinery Hall a boiler house with the most up-to-date equipment of different types of steam plant, including water-tube, marine and Lancashire, also hand and mechanical firing, furnishes about 5,000 hp., and this drives about a dozen various types of combined (all direct coupled) generators just inside the Machinery Hall but rallied apart from the ordinary exhibits.

The Machinery Hall is lighted by 250-10 ampere Brockie-Pell arc lamps, and there are altogether getting on for a thousand lamps of this type used in the lighting of the different departments as well as many incandescents. The grounds are lighted, however, for the most part by Welsbach high pressure gas and Kitson high pressure oil, and Scott-Snell high pressure gas. The grand avenue is lighted by 105 Brockie-Pell arcs, and in some of the gardens 90 are employed, the overhead wiring here used being aluminum.

Many electric motors are of course distributed throughout the different departments, and are doing all kinds of work in connection with the different exhibits in the machinery and industrial halls.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

It is reported that Guglielmo Marconi will soon be subject to military duty. The law of Italy is imperative upon this subject, and he cannot evade it. The King, however, has promised to assign him to duty on a naval vessel where he can continue his experiments looking toward the perfection of his system of wireless telegraphy.

THE degree of Bachelor of Science in Electrical Engineering will be offered hereafter at Brown University, Providence, R. I. The equipment of the electrical department has been recently increased by the purchase of a number of pieces of electrical machinery.

ACCORDING to a foreign contemporary the French company which towards the end of 1899 placed a number of electric motor cabs on the streets of Paris, has gone the way of its confrères in England and America. The experiment has proved altogether unprofitable, and it is said that a sum of \$900,000 has been sunk

in the attempt to obtain the approval of the public to an electric cab service in Paris. The failure of the concern is attributed to various causes, among others, the high cost of maintaining the accumulators and the consequent excessive scale of charges which had to be enforced.

ON May 23, five thousand skilled laborers employed in constructing the underground rapid transit road in this city quit work. As a result everything connected with the tunnel is at a standstill and it is claimed that the recent heavy rains have caused considerable damage.

THE Broadway line of the Metropolitan Street Railway Company of this city was converted from cable to electricity on Sunday night and Monday. This was the last of the cable lines to be done away with.

FOR some time past the Illinois Central Railroad has been engaged in the construction of an electric lighting plant for the purpose of lighting the stations along the tracks of the Chicago terminals. All the stations between Flossmoor, Ill., and Randolph street, Chicago, will be lighted with incandescent electric lights, and arc lights will be used in front of the stations. Electric lights will also be used at points about the yards.

UP to the present the application of electric light on railways in India has not made very great headway. A good sign of the development, however, which this branch of the industry is sure to enjoy sooner or later in that country, is the announcement that the Bombay Electric Company has entered into an agreement for lighting the through carriages of the Rajputana-Malwa mail trains between Ahmedabad and Delhi.

AT the Academy of Medicine in Paris, a short time ago an extraordinary contrivance by a dentist of that city was exhibited, the object being to render the extraction of teeth both pleasant and painless. At the same time that the laughing gas is applied a phonograph begins to reproduce musical selections. The practitioners have noticed that when the gas is administered alone many of the patients experience very disagreeable sensations, but these, it is claimed, can be prevented or overcome by means of music.

A PARTY of ten Californian automobilists recently indulged in a wildcat hunt. They followed the hounds as closely as possible, the country being favorable to the operation of the vehicles, and had the satisfaction of bagging a dozen of the felines.

IN a report to the State Department Consul General Guenther at Frankfort, Germany, says: "The association for the study of electric rapid transit railroads has made its report for 1900, and among other things it is stated that the elevated track of the military road between Berlin and Zossen, upon which experiments will soon be made, has been carefully inspected and strengthened. It is hoped to attain a speed of 125 miles per hour. Two cars will be employed, which are supplied with the strong machines required, and will hold from forty to fifty passengers. The construction of the cars and their equipment differ, in order to make manifold experiments. Each car will have four motors, aggregating from 1,000 to

National Electric Light Association.

Large Attendance at the Twenty-fourth Convention.

HENRY L. DOHERTY ELECTED PRESIDENT.

Many Important Papers Read and Discussed
—Reports of the Secretary-Treasurer and
Various Committees—Sketch of the New
President

The delegates to the Twenty-fourth Convention of the National Electric Light Association began to arrive at the International Hotel, Niagara Falls, as early as Monday, May 20. On Tuesday morning at 10:45 President J. Blake Cahoon called the meeting to order and read an address, which was in part as follows:

The President's Address.

Members of the National Electric Light Association.

Gentlemen: It becomes my pleasant duty, in the first year of the new century, to greet you at this historic place, now peculiarly of interest to the electrical fraternity by reason of the partial harnessing of the great Falls of Niagara, rendering them useful and subservient to the demands of man. Yet, while we know that thousands of their horse power are being utilized, which one of us, standing by their side and listening to their mighty roar, can detect this change? They seem to hurl back defiance at the puny attempts of man to control their restless energy. What will be the answer of man at the close of the twentieth century?

We are wont to class Niagara as the greatest water power in the world, yet it is only as the boy to the man, compared with some others. For instance, the Victoria Falls on the Zambesi River in the Dark Continent have a fall of 391 feet and a width of 3,200 feet, while Niagara has only 177 feet fall and a width of 1,968.

Long distance transmission of electricity has become a well-established fact, and as high as 60,000 volts have been successfully transmitted, while the distance has been steadily increasing.

The Snoqualmie Falls Power Company, of Seattle, Wash., recently operated a motor by means of current transmitted over a circuit 153 miles in length; the results obtained being so satisfactory as to demonstrate fully the feasibility of the plan.

In all parts of the country man is at work utilizing the water powers that nature has provided, which until the advent of electricity were in a great measure unavailable for his work. Those of our Association who can recall the early days of central stations, when a few hundred horse power were sufficient for the demand, may well feel amazed at the wonderful strides that have been made in their development during the closing years of the nineteenth century; but as the mind of man expands and develops, so will his ability to grasp higher and greater problems carry him on into those larger fields in the face of which our present works will appear even more primitive and puny than do now the central stations

of the early days. As Shakespeare well says, "We must construe the times to their necessities."

In taking a retrospective glance over the past year, we are struck with the fact that but little has been brought out that marks any distinct advance in apparatus. It is as though our associate members in the manufacturing field had taken the good house-wife for an example, and had been cleaning here and dusting there, clearing away the cobwebs; I hardly dare say getting the "bugs" out of things, for no good housekeeper would admit that there were such things in her house; nevertheless, technical "bugs" have appeared, and must be gotten rid of before apparatus is perfected, and so, apparently, our manufacturers have been busy setting their house in order preparatory to the next great step in advance.

Turning to the field of invention, we see a few bright rays peeping forth, just enough to nourish the hope, ever latent in our breast, that some better method of illumination is to be given us. Experiments have been carried on with the Nernst lamp with a view to reducing it to a commercial basis, and we may soon look for its appearance in a practical condition for ordinary use.

Ewald Rasch, a German, has brought out an arc lamp, somewhat similar in principle to the Nernst lamp, in that the carbon rods are replaced by rods of refractory material, such as the oxides of thorium, zirconium, magnesium, etc. These require heating before they will work, which is, of course, objectionable, but they possess the great advantage that the electrodes are permanent and do not require renewal. The efficiency is claimed to be about double that of the ordinary carbon arc lamps. By changing the material of the rods the character of the light emitted may be varied.

At the *Conversazione* of the American Institute of Electrical Engineers, held April 12, 1901, Mr. Peter Cooper Hewitt exhibited a method of lighting by vacuum tubes in which mercury had been placed. Upon current being applied from a 115 volt circuit, the mercury was first vaporized and then the vapor heated up to a point where it emitted a light so powerful, and of such a color, as to make the light from an ordinary inclosed arc lamp look like that given forth by a common gas jet. This is not in commercial form, as the light is very objectionable on account of its ghastly green effect; but experiments are now being carried on with other metals, and we may look for a successful issue in the very near future, for we of this day do not question the value of experiments as people did a century ago. In this connection, you will all recall an incident of Franklin's career, when he replied to a man that spoke rather contemptuously in his presence of Montgolfier's balloon experiments: "Of what use is a new born babe?"

When you visit the great Pan-American Exposition, and behold the marked advance that has been made in the arts and sciences, even since the World's Exposition at Chicago, just think for a moment that this could not have taken place except through a series of experiments taxing the brain and the patience of genius, as well as the pocket book of capital. Both have given freely, and the world has attained a higher degree of civilization by reason thereof.

Our committee reports will be presented for your consideration and action. There is not

3,000 horse power; two three-axle movable trucks, and the necessary transmuters, switching apparatus, etc. The cars will be about seventy and one-half feet long and will weigh about ninety tons. The experiments will doubtless prove of the highest importance for the improvement of rapid transit, although it may be found that the speed contemplated will not be feasible."

A DISPATCH from abroad states that experiments have been made between Berlin and Hamburg with the system of rapid telegraphy of Professor Rowland, of Baltimore. The results are most satisfactory, the new system easily doing double the amount of work done by the Baudot apparatus. The German Postal Department intends to introduce the Rowland system between Berlin, Hamburg, Cologne, Leipsic and Frankfurt.

A REPORT from Milwaukee, Wis., announces that the Peré Marquette Steamship Line is planning to furnish its seven vessels with a system of wireless telegraphy, to enable communication with the vessels while on the lake.

THERE is a strong probability that within a few months a wireless telegraph system will be in operation between Portland, Me., and Boston, Mass. Dr. J. P. Wentworth, in the interest of the New England Wireless Telephone & Telegraph Company, states that it is the Company's intention to establish not only a Boston service but to open stations in all the principal cities and towns of Maine. The system which the company uses, is known as the Dolbear system.

DR. A. SCHWEITZER describes in the "Elektrotechnische Zeitschrift" the results of some investigations which he has made to determine the influence of aluminum on the magnetic qualities of cast-iron when admixed in varying quantities. The ballistic method was used in making the observations, says the London "Electrical Engineer." From a table of the results of the observations in relation to the curves of the induction which the writer gives, it is seen that the curves of the induction become flatter as the proportion of aluminum is increased, losing gradually the characteristic form of the induction curve of the iron. For field strengths down to $H = 40$ the decrease of the induction is almost parallel to the increased proportion of aluminum. From $H = 11.6$ to $H = 3.6$ the induction with 2.45 per cent. admixture of aluminum is greater than the corresponding values for an induction of 1.62 per cent. The curves of the permeability also lose their characteristic form with increased proportions of aluminum; their maximum becomes smaller and the curves much flatter. The losses due to hysteresis increase with the larger proportions of aluminum, the curves of the losses as a function of the induction becoming increasingly pointed. For an induction $B = 3,000$ the hysteresis losses increase parallel to the increased proportions of aluminum, but for higher inductions they increase at a greater rate relative to the increase of aluminum. The results of the observations may be summed up briefly as follows: admixtures of aluminum with cast-iron effect a decrease of the induction for equal field strengths and an increase of the hysteresis losses for equal inductions. The magnetic qualities of the iron, in fact, are lessened in value.

one of them but has a practical bearing upon the work of this Association, and I urge that you give them most careful consideration. The papers that have been prepared are by men that speak with authority on the subjects in hand, and I wish to express to the authors my appreciation of the cordial response that they have made to our demands upon their time.

Every combination of circumstances seems to be in favor of this being the best Convention this Association has ever held, and I hope everyone present will depart at its close with the feeling that he has been well repaid for dropping his work temporarily and joining together here with others in a mutual endeavor to give and receive knowledge that will be of benefit to each and all of those interested in the work of this Association. (Applause.)

President Cahoon—I now declare the Twenty-fourth Convention of the National Electric Light Association open and request the Secretary to read the notices that we have. As Mr. Van Trump is unable to be here this morning, the paper of Mr. Calvin W. Rice will be substituted for it. One of the resolutions is not quite ready, and I will therefore ask Mr. Rice to be kind enough to read his paper.

Calvin W. Rice, New York—Mr. President and gentlemen: Before reading the paper I think it well to explain that on so large a subject I have not attempted to speak of everything in detail. The difficulty seems to be to judge how much to leave out rather than how much to put in.

Mr. Rice then proceeded to read his paper, entitled "Distribution of Current at High Potential in New York City." [The paper is printed in this issue of *ELECTRICITY*.]

A short discussion ensued in which Messrs. Nicholls and Rice took part.

President Cahoon—I hope you gentlemen will not let the first papers escape you, but that you will discuss them fully. There is one objection to reading the first paper or two at a meeting, and that is that the members do not seem to warm up to the fact that the papers are read for the purpose of picking them to pieces and getting out what meat there is in them. We would be glad to hear from anyone else who would like to discuss this subject. I want to say, gentlemen, in regard to the arrangement of the programme that an endeavor will be made to carry forward the business of the meeting at this session, this afternoon and the session to-morrow morning, so as to leave to-morrow afternoon clear. It has been suggested that the members attend the Pan-American Exposition to-morrow afternoon in a body, and arrangements will be made for a special provided enough members signify their wish to go in that way.

Mr. Scott—It seems to be the unanimous idea that we shall attend the Exposition in a body. I would say that we should have at least 100 go in order to obtain the privilege of a special train.

A rising vote was called for on the question and the President decided that it was carried unanimously.

A suitable resolution was then offered and adopted in regard to the death of Z. T. Gramme, the famous inventor, who was an honorary member of the Association.

President Cahoon—In furtherance of our purpose to advance the programme, I will now call on Mr. L. R. Wallis for a paper in regard to the charge for current.

The paper was then read, after which a short discussion ensued in which Messrs. Walker and Slade took part.

Mr. George E. Tripp of Boston, chairman of the Committee on Uniform Accounting, next made his report. The subject was discussed at length. It was moved and carried that the report be received.

The Secretary read letters of regret at their inability to attend from the following gentlemen: Lord Kelvin, London; Prof. Henry T. Bovey, Montreal; Prof. Edward L. Nicholls, Ithaca, N. Y.; Elihu Thomson, Lynn, Mass.; Charles F. Brush, Cleveland, and Henry L. Doherty, Denver, Col.

A communication from the Niagara Falls Power Company, extending a cordial invitation to the members of the Association to visit the power house and plant of the company, was also read. The invitation was accepted with thanks.

The meeting then adjourned until 2:30 P. M.

TUESDAY—AFTERNOON SESSION.

The President called the meeting to order at 2:45 o'clock.

President Cahoon—The first paper to be read this afternoon is that by Mr. Willcox on "The Practical Side of the Incandescent Lamp."

The paper was then read and discussed.

President Cahoon—As there are no other questions, I have one or two announcements to make. A letter from Mr. Morgan, general manager of the Niagara Gorge Railroad Company, which reads as follows:

"Gentlemen, it gives me great pleasure to tell you that I will be able to arrange an electric illumination of the Whirlpool Rapids on the Great Gorge Route this evening, and I beg to extend to the Association the courtesies of our line."

President Cahoon—At 4:30 this afternoon there will be two cars in front of the hotel here to take the Association over to the power house to go through it in a body. Arrangements have been made by our master of transportation for a special train to the Pan-American Exposition, leaving here at 2:30 P. M. sharp to-morrow and returning at 10:30 P. M., the train to run directly to the Exposition grounds. The fare will be 50 cents for the round trip. I gave this morning a list for the Nominating Committee, and I regret to say that one of the gentlemen, Mr. Lovejoy, is unable to serve, and I have therefore appointed Mr. Fairbanks of Worcester in his place. The next thing on the programme is the report of the Committee on Standard Candle-Power of Incandescent Lamps. Dr. Bell is unable to be present and delegated Mr. Ayer to read the report.

The report followed, and a discussion ensued in which Messrs. Ayer, Cahoon, Hubley and Marsh took part.

The meeting adjourned at 4:30 o'clock and the delegates in a body visited the power house and plant of the Niagara Falls Power Company.

WEDNESDAY—MORNING SESSION.

President Cahoon called the meeting to order at 10:45.

Secretary Porter read letters of regret from Governor Odell of New York and from W. Worth Bean of St. Joseph, Mich.

President Cahoon—Gentlemen, we will resume the work where we left off yesterday, when Prof. Goldsborough arose in regard to the discussion of Dr. Bell's report. I will call on Prof. Goldsborough at this time.

The subject of the standard candle power of incandescent lamps was further discussed at length.

The report of the Committee on Amendments to the Freight Classification was next taken up and discussed.

President Cahoon—The next matter on the programme this morning is a paper by Mr. H. W. Hillman, of Schenectady, N. Y. I will call on Mr. Hillman. While we are waiting for this paper to be distributed I will say that the Convention will go into executive session at 12:30 to-day. At that time there will be brought up a report of a Committee on Legislative Policy, and also the election of officers for the ensuing year. The trip to the Pan-American Exposition has been postponed until to-morrow afternoon on account of the rain to-day. Announcement will be made to-morrow morning as to what arrangements we can make about train for to-morrow, and whether a special train will be there to bring us back or not. Many of you will undoubtedly want to go directly from Buffalo to your homes. In that case you will not of course want to come back here.

Mr. H. W. Hillman then read a paper entitled "Arc Lighting at the Beginning of the Twentieth Century."

Mr. Walton—Mr. President, I would like to ask Mr. Hillman what methods he would suggest to overcome the so-called induction on telephone lines paralleling series alternating arc lighting lines. We have recently had such a case.

Mr. Hillman—Mr. Wagner has had particular interest in that matter and I think that he would explain and answer your questions a little better than I could. I would ask him if he would kindly do so.

Mr. Wagner—Referring to the telephone trouble on induction series alternating systems in general it is pretty hard to get rid of trouble if telephone circuits are grounded and not metallic circuits. I know that in one place 50 light transformers were installed running single circuits, and so long as a few of the telephone circuits were ground return there was considerable trouble. The minute they were changed over to metallic circuit the trouble practically disappeared. I think the instance Mr. Hillman refers to my being interested in occurred in Toledo. In Toledo there was a 100 light current transformer installed operating what we call single circuit, that is, about 8,000 volts instead of two multi-circuits of about 4,000 volts each. There was considerable trouble experienced on the telephone lines, though they were metallic, when the system was installed in this manner. We took the matter up to investigate, and arrived at a conclusion as to the exact cause. The cause might be either electrostatic or electrodynamic. To find out which of the two conditions existed we short circuited each lamp; at the switch and top of the lamp ran the normal current through the circuit, so that if the trouble was electro dynamic it should still exist. When this test was made, the telephone trouble entirely disappeared, showing that the trouble was not electro-dynamic and that it was electrostatic. I was talking with one of the gentlemen from Toledo this morning, and he tells me that since they have changed the circuit from a single circuit of 8,000 volts to a combination multi circuit of about 4,000 volts each the trouble has practically disappeared. It has entirely disappeared on the complete

metallic circuit and has been reduced about 75 per cent. on the ground return circuit. Theoretically other steps could be taken to entirely get rid of the trouble, but owing to the fact that grounds occur quite frequently on arc circuits and also that there is liable to be quite considerable trouble constantly, these other schemes are not really practicable, and the operation at a lower voltage seems to have taken care of the trouble.

The discussion was participated in by Messrs. Bechtel, Walker, Hillman, McCabe, and others.

President Cahoon—This afternoon we will take up the report of the Arc Lamp Committee; and also the discussion of the paper of Mr. Louis R. Wallis, on "The Foresee System of Charging," which was read at the meeting yesterday morning.

The meeting then adjourned to an executive session.

At the executive session the report of the Committee on Legislative Policy, Mr. Samuel Insull, chairman, was accepted, and the committee continued for another year.

The report of the Committee on Amendments to By-laws was also presented, and this committee was continued, the incoming President and First Vice-President being added to the committee.

The following named gentlemen were elected as officers for the ensuing year.

President—Henry L. Doherty, Denver, Col.
First Vice-President—Louis A. Ferguson, Chicago.

Second Vice-President Charles B. Hunt, London, Ont.

For members of the Executive Committee to serve during three Conventions—Charles L. Edgar, Boston, Mass.; D. B. Robinson, Seattle, Wash., and C. C. Howell, Knoxville, Tenn.

For members of the Executive Committee to serve during two Conventions—E. L. Bemis, New Orleans, La., and Dudley Farrand, Newark, N. J.

Mr. Frederic Nicholls, Toronto, Can., was elected an honorary member.

The meeting adjourned until 2:30 P. M.

WEDNESDAY—AFTERNOON SESSION.

The President called the meeting to order at 3 o'clock.

President Cahoon—The first thing that we will take up this afternoon is the discussion of Mr. Wallis' paper on the "Foresee System." You will recall that it was postponed from yesterday.

The discussion was opened by Mr. Slade and participated in by Messrs. Wallis, Walker, Price, Turner and others.

President Cahoon—I believe that we will consider the discussion closed on this subject, and take up the second progress report of the Committee for Investigating the Photometric Values of Arc Lamps.

Mr. C. P. Matthews, photometrist to the committee, read the report of the committee.

Mr. Hubley, Louisville, Ky.—This is a very interesting report and evidences the very good work performed by the committee. I wish to move that the Association accepts the report, tenders a vote of thanks to the committee for its good work, and that the committee be asked to continue this work until its completion.

The motion was carried.

President Cahoon—We will now take up the report of the Committee on Rules for Electric

cal Construction and Operation, Capt. William Brophy, chairman.

Capt. Brophy presented the report and also reported on the subject of the Grounding of the Neutral.

Both reports were received, after which the meeting adjourned.

THURSDAY—MORNING SESSION.

President Cahoon called the meeting to order at 10:30 o'clock, and announced that the first business would be the report of the Secretary and Treasurer.

Secretary Porter then presented a report, showing the following financial transactions during the year 1900:

Receipts for the year.....	\$7,776.50
Balance in bank.....	4,368.55

\$12,145.05

Disbursements.....	6,143.41
--------------------	----------

Balance Jan. 1, 1901..... \$6,001.64

On motion the report of the Secretary was received.

President Cahoon announced that in honor of the National Electric Light Association the dome of the Electricity Building at the Pan-American Exposition would be illuminated to-night at 8:30 o'clock, which would be the first exhibition of the Nernst lamps, the illumination being done by the Westinghouse Electric & Manufacturing Company.

President Cahoon—The next order of business will be the reading of a paper by C. R. Van Trump of Wilmington, Del., on "A Station Load Diagram." In the absence of Mr. Van Trump we will ask Mr. McCabe to read the paper.

The paper was read.

President Cahoon—We have just received a telegram from Mr. Henry L. Doherty, the newly-elected President of the Association, as follows:

Denver, Col., May 22, 1901.

George F. Porter, Secretary National Electric Light Association.

Please convey to the Association my deep appreciation of the honor conferred upon me and assure them of my wish to make the Association large and prosperous.

HENRY L. DOHERTY.

President Cahoon—We will now take up the topic for discussion, namely, "Steam Heating from Central Stations."

The discussion that ensued was participated in by Messrs. Mannsell, Hubley, Wells and others.

Mr. Treadwell's paper on "Storage Batteries in Central Station Work" was read by Mr. T. C. Martin. The reading of the paper was followed by an interesting discussion participated in by Messrs. Sperry, Emory, Blizard and Donaldson.

President Cahoon—Are there any further remarks on this topic? There seems to be none.

I want to thank the gentlemen who assisted us in reading the papers of members who are absent, and say to them that we appreciate very much their assistance. We have completed the programme of the meeting, not in a hurry, but a little ahead of time, which is something unusual. When we compare our membership with that of the Gas Association, the Waterworks' Association, and various other of the national bodies, we find that their membership is well in advance of ours. I do not know why it is that electrical men hold back from joining this Association. One of the members remarked yesterday that perhaps it was due to the fact that in earlier years we had acquired a reputation for being somewhat boisterous

at our conventions; but like many things in the earlier days that is a thing of the past. The Association has come more and more each year to realize that these meetings are for the benefit of the members and that much can be learned by coming here and meeting other gentlemen in the same business and gaining knowledge from contact with each other.

I hope during the year to come that you gentlemen will each and every one make up his mind to bring a new member into the Association. We have made a good beginning. We want that work to go on and we want particularly to bring this Association up to the plane on which it should be. There are 1800 stations in the country that can afford to join this Association. In our present membership we have, roughly speaking, 10 per cent. of that number.

After a few further remarks by President Cahoon the Convention adjourned.

Sketch of the New President.

Mr. Henry L. Doherty, the newly-elected President of the National Electric Light Association, was born on May 15, 1870. He spent his early youth in Columbus, O., and started wage-earning by carrying papers, and at the age of 12 years obtained employment with the Columbus Gas Company. The superintendent of this company, and afterward its manager and president, was Emerson McMillin. Since Mr. Doherty first entered Mr. McMillin's service he has been (with one or two short exceptions) continuously connected with the McMillin interests, holding various positions of trust.

On account of his health Mr. Doherty moved to Madison, Wis., early in 1896 and became general manager of the Madison Gas & Electric Company, afterward becoming president. The plant was threatened with municipal opposition, which he successfully averted. His opposition to municipal ownership has brought him into prominence and stamped him as an active and effective worker. His exposition of the municipal-ownership question before the League of American Municipalities is still fresh in the memories of many.

Mr. Doherty has been foremost in furthering the objects and plans of the Northwestern Electrical Association and the National Electric Light Association. In January, 1899, he was elected President of the Northwestern Association, a position which he held with credit to himself and the society. His presidential address at last year's annual meeting of the Association attracted much attention. In this address he dwelt at length on methods of charging and equitable rates, a general subject upon which Mr. Doherty presented a paper to the National Electric Light Association in Chicago a year ago, and also one before the Northwestern Association last January. He has given this topic close and efficient study and has been putting his system into operation in different McMillin plants. He is now conducting a rate war in Denver, where he is acting president of the Denver Gas & Electric Company. Although he devotes considerable of his time to the Denver plant and also looks after the Madison and other plants as Mr. McMillin's assistant, Mr. Doherty spends much of his time in New York City.

Mr. Doherty's connection with the National Electric Light Association has been an active one from the start. At the time of his election to the Presidency he was chairman of the executive committee. The new President is also a member of the American Institute of Electrical Engineers and of several other associations.

THE TRANSMISSION OF CURRENT AT HIGH POTENTIAL IN NEW YORK CITY*

BY CALVIN W. RICE.

In America the most acceptable system in cities is the low-tension Edison, 220 volt, direct current, three wire system. This system is the one best adapted to miscellaneous lighting, power and industrial work. The value of a power business in connection with lighting is recognized by all, and as there are in the market a score or more makes of direct current motors, each manufacturer is therefore an agent of the light and power company.

The system requires sub-stations at frequent intervals, determined by the relative cost of transmission system loss in same and station equipment. As steam stations they have less economy than central stations, and are sometimes placed where they are somewhat objectionable to residents.

The perfection of the rotary converter has been a great factor in the ability to meet the desire to generate power in a large central station located with advantage to coal and water.

With the revolving field generator came the ability to generate current directly at high potential. It was thus rendered possible to do away with step-up transformers for all ordinary potentials and transmissions.

Accompanying this advance was the development of switching and safety devices for high potentials.

Thus we have in outline a perfected system, namely, the generation of current in one large station favorably located, its transmission to sub-stations, and local distribution from each such center.

In New York, the above system is also adopted for pure power, that is, railway work, as well as for combined lighting and power.

The East River side of New York has been selected for the sites of the four power stations now building. These are located at 39th street, New York Gas and Electric Light, Heat and Power Company; 75th street, Manhattan Elevated Railroad; 96th street, Metropolitan Street Railway, and at the northern limits of Manhattan Island, near Spuyten Duyvil, for the Third Avenue Railroad station. In all of these stations large direct connected units are employed, generating the transmission voltage.

The generators in all are of the three-phase, revolving field type, twenty-five cycles, seventy-five revolutions.

The Third Avenue station, the Metropolitan, and the New York Gas generate at 6,600 and the Manhattan at 11,000 volts.

The transmission in each case will be in three-conductor cable laid in subways, three inch duct in three systems, and three and one-half inch in the case of the Manhattan. In each system, also, the transmissions will be to sub-stations with step-down transformers and rotary converters.

The potential of the outers of the Edison three-wire system is 270 volts nominal, and for the railway work 550 to 600 volts.

The frequency of twenty-five cycles admits of satisfactory design in the rotary converter, which is one of the essentials of the system. Low frequency is also preferable, as all the generators are direct-connected to Corliss type engines. On the other hand, it does not admit of successful lighting in either incandes-

cent or arc, with the possible exception of the street series incandescent lighting.

The above shows the points in common to all stations. We will, however, now speak particularly of the largest station, that of the New York Gas Company.

Before going to the description of the central station—which, by the way, will have the largest capacity of any in the world, and more than the completed twenty-wheel plant of the Cataract Power Company at Niagara—it is well to state that the whole system now being installed was planned several years ago.

As early as 1896, the Edison Company installed motor generators in a cellar, at the corner of Fifth avenue and 72d street. These were 240 kilowatt synchronous two-phase motors, direct-connected at either end to 100 kilowatt, 135 volt Edison bi-polar generators. This was the first step in New York city in the development of the present sub-station employing rotary converters.

In 1898, two-phase, 200 kilowatt rotary converters were installed in the 83d street station, and later, in that same year, three-phase rotary converters were placed in the Duane street and 39th street stations, so that energy could be transferred at 6,600 volts alternating between the districts.

The efficiency transmitting 1,000 kilowatts, the full load of a rotary, from the direct current switchboard at one generating station, including all transformers and line loss, to the direct current switchboard at the receiving station is 81 per cent. This shows the practical economy of a flexible system.

By this means the Duane street station, which is situated at the southerly end of the island, can follow the load as it moves uptown with the people as they go from business to their homes, and then to the stores and theaters. A very high load factor is thus obtained throughout the year.

The waterside station occupies the block between 38th and 39th streets on First avenue down to the East River. It is situated at nearly the geographical center of distribution.

The area covered measures 272 feet by 197 feet, so that with its ultimate capacity of 125,000 horse power they will have a horse power for every 0.43 square foot, and in this respect will have not only the largest station, but also the most economical of space.

The equipment will be sixteen direct connected units. The engines will be 5,200 horse power at most economical cut-off, and will have a maximum capacity of 8,000 horse power. They will be vertical, three-cylinder, compound-condensing, taking steam at from 175 to 200 pounds.

The generators will be 3,500 and 4,500 kilowatts at 6,600 volts, and will have a regulation of 8 per cent., and on short circuit will give about three times full-load current. These characteristics of regulation and high self-induction insure smooth running and good synchronizing ability.

Steam will be supplied from fifty-six watertube boilers, 650 horse power each. Each boiler will be equipped with mechanical stokers. The boilers will occupy two floors of the boiler house; the coal bunker, with a storage capacity of approximately 10,000 tons, being located immediately above the boilers.

There will be four steel stacks, about 200 feet high and nineteen feet internal diameter. These will be supplemented by fan blowers for forced draught.

Condensing water for the engines will be supplied from East River through a main exterior intake tunnel ten feet in diameter. This tunnel will be divided at the building line into two eight-foot tunnels, which will run under the two rows of engines. The discharge tunnel will be placed just above the intake tunnel.

The switchboard will be distributed in galleries.

Single conductor cables will be led out from ducts in the foundations of the generators and will go to electrically-operated oil switches situated on the first gallery. From there cables will go to the selector air switches on the top gallery. These selector switches will be operated by hand and are to be used as a safety in an emergency when the oil switch fails to act.

As there will be sixteen units, so there will be sixteen banks of oil switches. In between each group of three oil switches, one for each phase, will be the transformers for the instruments, voltmeters and ammeters.

On the top gallery the grouping of the switchboards will be such that it will be physically possible for one man to control the entire situation. Of course, two men will be on duty at all times, as a matter of practical operation, but it is interesting to note that the switches will be so grouped with their instruments that one man can handle the situation.

The governing control of each engine will be manipulated also from this point, and one will be able to vary the cut-off from 20 per cent. to 45 per cent., or the speed 2½ per cent. each way from normal.

The cables for the transmission are lead covered, three-conductor, 250,000 circular mils. At first only rubber was used, but this last season paper was tried, so that now it is about equally divided, there being about twenty-five miles of each.

In the rubber cable each conductor is insulated with six thirty-seconds of an inch rubber insulating wall. The three conductors are then laid with jute and made into a cable of circular section and another jacket of rubber put on, four thirty-seconds of an inch in thickness. The rubber compound is 30 per cent. pure Para. The lead is one-eighth inch thick, three per cent. tin, but with no outside coating of tin. This gives a cable two and five-eighths inches outside diameter, and the experience from laying fifty miles of cable would indicate that this is the largest practical cable that can be installed in a commercial three inch duct.

The insulation resistance required on the rubber cable was 1,000 megohms per mile, measured either between conductors or between conductor and lead. The completed cable was tested to 20,000 volts in the ducts.

The paper cable was similar, but with two-thirty-seconds inch more insulation in the outer jacket, making twelve thirty-seconds inch insulating wall in all directions. Insulation resistance required on this was 400 megohms per mile.

The paper cable measured two and eleven-sixteenths inches outside diameter, and although it has all been installed, yet it was done with difficulty; and one would not advise attempting it again, as it was a great mechanical strain on the cable. The natural question in the minds of many is, which is better? It is proper to say that satisfaction has been obtained with both.

The number of conductors at present in-

ARTICLE NO. 29.

CONDENSERS AND THE MEASUREMENTS OF THEIR CAPACITY.

stalled is such that at no point in the system is there more than 5 per cent. actual drop in any feeder. As 40,000 feet is the longest, it happens that the 5 per cent. limit on drop at that distance is reached at the maximum ampere capacity of the cable, which is about 225 amperes, or a little over 2,250 kilowatts. This gives a little over two watts per duct foot, which is also a limit in subway work. Were there a larger number of ducts in one trench, even two watts per duct foot could not be allowed.

Cables are allowed sufficient slack to be carefully racked on the sides of the manholes. The outside of the cables is wrapped with asbestos and steel tape so that, in the event of one cable failing, it will not melt the lead and insulation off its neighboring cables. This covering complete costs about five dollars per cable per manhole.

At the substations the cables go to marble switchboards, each circuit being separated by septums from its neighbor. Each circuit is provided with safety devices. The switchboard cables lead to the air-blast transformers, which are connected in to give a double delta or six-phase relation on the secondary.

The rotaries are six-phase, as it is agreed that their action is better, less armature heating, and the amperage led into each collector ring is reduced.

Between the statics and the rotary are the induction regulators. These regulators have about 13 per cent. of the capacity of the rotary, as a potential regulation of thirty volts is required either way of normal, which is 270.

Only two sizes of rotaries are used, 500 kilowatt and 1,000 kilowatt.

An interesting feature of the entire system is that all translating devices are in multiple; that is, all rotaries, in whatever location, are in multiple on the alternating current side with the generators at the central station and with every other rotary in the substation. On the direct current side every rotary is in multiple with every other rotary, direct current generator or storage battery.

By means of the field rheostat all rotaries are operated at minimum input, which gives a power factor of one to the system.

Floating on the system in almost all of the rotary and substations are storage batteries. The most common unit is one of 150 cells, having a capacity of 2,000 amperes discharge for one hour.

The completeness of the system is shown by the uniformity of potential and continuity of service. It is considerably over ten years since there has been an interruption of service.

A New Process for Making Hydrogen.

Richard Guenther, the United States Consul General at Frankfurt, Germany, writes to the State Department that German papers report that H. Houbon, an Englishman, has invented a process for making pure hydrogen from acetylene. He condenses acetylene in a Cailet steel bomb up to five atmospheres, and ignites it by means of electricity. Hydrogen and carbon are formed; the latter precipitates in form of fine soot. The process is, it is claimed, without danger and makes it possible to generate hydrogen on a large scale very cheaply. This invention may mean much for balloon technique, the Consul General thinks, as the present methods of making hydrogen are expensive.

The condenser has not received a great amount of popularity in the electrical field until within the last few years, although it has been used in testing appliances and on X-ray coils; however, the great field of its usefulness has not developed until the recent modernized systems of telephony have been adopted, and in that work it has become very popular and its scope of practical usefulness considerably broadened. Condensers depend entirely for their action upon the law of electrical capacity, and the function performed by them in practical work is directly opposite to that of a retardation coil. The retardation coil permits of the free passage of a direct and even flow of current, but in it the law of self-induction impedes the flow of an alternating or disturbed current.

The flow of a direct current is entirely stopped by placing a condenser in its circuit, but however its action when placed in an alternating circuit is such as to produce the same practical effect as if it were not in the circuit.

Every electrical conductor has capacity to a more or less degree, that is to say, it will hold a certain magnitude of current as a charge, and on this law is based the action of the condenser.

A condenser consists of two electrical conductors separated by an insulation known as the dielectric. The plates, coatings or conductors may be made of any conducting material and the dielectric of any insulating material; however in their construction the materials are used which are known to give the best effect.

When an insulated wire is laid in the earth or is strung overhead it becomes one plate of a condenser because it has capacity. The other plate of the condenser is the earth and the dielectric is the insulation of the wire or the air which is between it and the earth.

The capacity of a wire has a great deal of effect on its usefulness in telephone or alternating current work, and that is the reason why telephone transmission is not nearly so good through an underground cable as over an equal length of overhead wires. The underground wire has a great deal more capacity than overhead lines, as the capacity depends directly on the area of the conductors or plates, their closeness together and the inductive capacity of the dielectric. Insulating materials have very different values as dielectrics and the inductive action is very much stronger through some material than through others, air being the insulation through which it is the least active.

Commercial condensers are made with sheets of tin-foil for the coatings, separated by thin paraffin paper and then rolled and placed in a suitable box or covering. The sheets of tin-foil are separately connected to terminals mounted on the outside of the case. The combined capacities of the coatings are the rated total capacity of the condenser. By charging a condenser with a certain quantity of elec-

tricity means that a positive charge of a certain quantity is placed on one plate and an equal negative charge on the other.

To illustrate the electrical phenomena of a condenser we will compare its action to that of water in two vessels which are connected together by a tube, as described in Fig. 1.

FIG. 1.

Suppose A B to represent two vessels connected together by a tube filled with water as represented by the shaded line. Suppose a force pump be placed at point X and by it the water be forced up into the vessel A. The amount of water forced will be limited by the capacity of the vessel and a vacancy in the vessel B will be created equal to the amount of space filled in A. Now immediately the force be taken away and a free flow permitted back through the tube the water will flow back into B until an equal level in each vessel is reached. This clearly illustrates the action of a condenser to an electric current. If a direct flow of current be applied to the terminals, the plates will be charged to an extent depending upon their capacity and will not discharge or find their equal electrical level until a circuit is provided for the positive to discharge to the negative, which will not occur so long as the pressure of the direct current is kept applied in one direction in the circuit. So you see no effect could be secured by connecting a battery or direct current to a condenser except to charge the plates, which would remain inactive until allowed to discharge by making a circuit between the plates. To illustrate this, connect the two poles of a battery to a condenser, then disconnect the battery and go across the two terminals of the condenser with a telephone receiver and the flow of the current from the positive plate to the negative plate will be distinctly heard.

The action of an alternating current on a condenser, however, is much different, in the fact that an electrical disturbance is maintained in the circuit. The current alternately charges each of the plates of the condenser, which discharge back through the circuit when the current is changing its polarity and has reached the no potential point, so that an alternating electrical disturbance may be maintained equal to and governed by the capacity of the condenser to an electrical charge.

The practical application then is that a condenser will act as an "open" when connected in a battery or direct current circuit, while if connected in a circuit with an alternating or disturbed flow of current the amount of electrical action which can be maintained in the circuit is equal to the capacity of the condenser.

During the charge of a condenser the electrical pressure of one plate rises and the electrical pressure of the other falls just as the water in the two vessels.

In measuring the capacity of a condenser it is said that it has the capacity of one farad when the difference of the electrical pressure of the plates is raised one volt by the charge of one coulomb. For practical pur-

poses this measurement is divided into microfarads. A microfarad is the one-millionth part of a farad and has now become the common unit in which capacities are measured.

Several of the uses to which condensers are put are as follows: By placing a condenser in series with the ringing coils in a telephone which is used in common battery work it provides an open circuit for the direct current when the telephone is not in use and yet permits of the bell being rung with alternating magneto current from the central office. It is also connected around telephone transmitters to sharpen the induced current waves in an induction coil. If an excessive arc is produced at the contact of a circuit breaker or on the make and break contact of a vibrating bell it may be entirely dispensed with by connecting a condenser of sufficient capacity across the point of arc so that it will take up the arc of the break as a charge into the plates, which will discharge again immediately the vibrator makes contact.

This application is found very valuable in the "break" contact on X-ray coils when the sparking is very damaging on account of self-induction of the coil.

They are also used in testing appliances, which are used for measuring the capacity of cables and aerial wires.

Article No. 30 will be entitled "Points for Review."

THE HORSE POWER OF STEAM ENGINES.

BY W. H. WAKEMAN.

One of my numerous correspondents wants to know how to determine the piston speed of an engine, as he finds that he must settle this question before he can figure out the power his engines are developing. It is an easy matter to find rules for this, in which the area of piston, mean effective pressure and piston speed are to be multiplied together, but they do not tell how to determine the piston speed.

This man is not a beginner, so far as running an engine is concerned, for he has been in charge of plants for years, and at present is caring for one of a respectable size, but this question is not clear to him, and while thinking the matter over I have wondered how many others were not clear on the same subject. To those who already know how to solve this problem it seems very simple, but you must remember that there was a time, and it may not have been a very long time ago, either, when you were not so well posted as you are now, so do not be too hasty in saying that such an article as this is not called for, because it is quite possible that you are mistaken.

In the case of an ordinary engine taking steam on one end of the cylinder and then on the other, it is proper to take the piston speed for both strokes and for the number of revolutions made in one minute, for the horse power of every engine is calculated on the basis of what it does in one minute of time. For illustration, take the case of a 20 x 42 inch engine making 85 revolutions per minute. As it starts from the center and travels over to the other center it goes 42 inches or 3½ feet. As the piston comes to a full stop and then re-

verses its motion, it comes back to the place from which it started, making another stroke of 3½ feet, and this completes one revolution. It has now traveled 7 feet, and as it does this 85 times in each minute, we multiply 85 by 7 and find that the speed is 595 feet.

With a 16 x 20 inch engine running 150 revolutions per minute, the calculation is as follows: The travel is 40 inches, which is 3½ feet for each revolution, and $150 \times 3\frac{1}{2} = 500$ feet per minute.

I find that engineers do not always understand how to calculate the piston speed of a single acting engine. It must be plain to every one that when the steam acts on one end of the cylinder only, the engine cannot develop as much power as it will when the steam is admitted to both ends, therefore it is customary and proper to take one-half of the full piston speed, because in that way we calculate on the travel of the piston while the steam is acting on it.

While several engineers were discussing this point one evening, one of them claimed that the piston traveled just as far on a single acting engine as it did on any other kind, therefore he did not understand the philosophy of taking only half of it.

We might take one-half of the area, or one-half of the mean effective pressure, or divide by one-half of 33,000, or figure it up the same as we would for a double acting engine and divide the final result by 2 for an answer, but somebody would be found who would object to each one of these plans and claim that the philosophy of it was not sound—therefore we might as well stick to the plan of taking one-half of the piston speed.

For illustration, if the 16 x 20 inch engine was single acting we would calculate its power in the usual way, except that the piston speed would be 250 feet.

Another point that I know has proved to be a stumbling block to some, is the matter of deducting the area of piston rod from the surface of the piston in order to get the net area on which the steam acts. If we take the case of a large horizontal engine having a piston rod that is continued through the cylinder head on the head end in order that it may be supported at both ends of the rod, it is proper to deduct the full area of the rod from the piston, but where the rod covers a space on one side only the full area must not be taken out. There are at least two ways of doing it, either one of which will give a correct result, but one is much more complicated than the other. Taking the 16 x 20 inch engine to illustrate this, and calling the diameter of rod 2½ inches, the area of which is nearly 5 square inches, we might calculate the area of the piston to be 201 square inches for 250 feet of piston speed, and take out the 5 square inches, leaving it 196 for the other 250 feet and add the two together. Then $201 \times 250 = 50,250$ and $196 \times 250 = 49,000$. Adding these together the sum is 99,250.

The foregoing is one way to do it, and the following is the other: Dividing the area of rod by 2 gives 2.5 square inches to be subtracted from the full surface. $201 - 2.5 = 198.5$ and $198.5 \times 500 = 99,250$ as before.

The above illustration makes it plain that the plan of subtracting one-half the area of piston rod from the area of piston is to be preferred on account of its simplicity.

Another thing that will bear explanation is that it is not correct to use the average pres-

sure on the piston, as some authors tell us very plainly to do.

When the piston of an engine starts from the head end and travels through a stroke the pressure on it varies at different points, so that if we want the average we must measure it at these different places, add the results together and divide by the number of measurements. The quotient will be the average pressure for that stroke, but all of this is not available for driving the piston and transmitting power to the crank, because there is some pressure on the other side of the piston at the same time which acts to oppose the advance of it, and this we call back pressure.

This may not be the same at all points in the stroke, therefore we must get the average of it in the same way that we did for the forward pressure. When we subtract the average back pressure from the average forward pressure, the remainder is the mean effective pressure, and this is available for driving the piston, therefore it is proper to use it as a factor when determining the indicated horse power.

A NEW THEORY OF WIRELESS TELEGRAPHY.

M. Rudolf Blochmann, in the "Revue Générale des Sciences," February 15th, makes an important contribution to the theory of wireless telegraphy, which throws a great deal of light on certain phenomena, for which, hitherto, no satisfactory explanation has been given. For instance, why can wireless telegrams be transmitted to a greater distance over sea than over land, and why are horizontal antennæ less effective than vertical antennæ?

These questions, according to M. Blochmann, are completely answered by taking into consideration the electrical condition of the medium through which the electric waves are transmitted. This medium is the atmosphere near the earth's surface, and the author points out, what has usually been forgotten, that this medium is not in a state of electrical equilibrium, but is subjected to a severe electric strain by the permanent electrostatic charge in the earth. The presence of this charge gives rise to a considerable electrostatic strain in the atmosphere near the earth's surface, which strain may be represented by a series of equipotential surfaces enveloping the earth, as the layers of a bulb surround the central core. At sea these equipotential surfaces are regular and parallel to the earth's surface, but on land they follow such inequalities as high buildings, cliffs, mountains, etc., and are consequently bent and twisted like the geological strata of an alpine region.

The vertical antenna of a transmitting apparatus pierces these equipotential surfaces in a normal direction, and the disturbances produced by the intermittent charges of electricity sent into the wire have their greatest effect in an axial direction. Violent oscillations in the equipotential surfaces over the end of the wire are produced by the periodic variations of potential at the end of the wire, much in the same way as waves are produced on the surface of a pond by dropping a stone into it. As the waves in the pond spread out over the level surface of the water, so the electric waves spread out in every direction along the equipotential surface, following all the irregularities of its surface.

Electric waves used in wireless telegraphy do not, according to this theory, propagate themselves in straight lines, like waves of light, or very short Hertzian waves. Hence we have an explanation of the well known fact that wireless messages can be transmitted between antennæ whose tops are, owing to the curvature of the earth, invisible from one another. Irregularities in the equipotential surfaces, as might be imagined, obstruct, to a certain extent, the passage of electric waves over them, and, as a consequence, the distance to which messages can be transmitted on land is not so great as at sea. Experiments made at Mt. Blanc have shown that mountainous regions are unfavorable to wireless telegraphy.

A horizontal antenna is comparatively ineffective because the maximum potential disturbances at its terminals are not normal to the equipotential surfaces. Another important deduction which may be made from Blochmann's ingenious theory is that the antennæ of wireless telegraphy apparatus set up on the edge of a cliff or on a steep hillside should not be vertical, but nearly perpendicular to the slope where they are fixed.

In a country with an irregular surface, the ends of the antennæ of the transmitter and of the receiver, though of the same length, may not pierce the same equipotential surface, and if so this will detract considerably from the efficiency of the transmission. The wireless telegraph engineer in seeking to fulfill this requirement of theory may have to make the antennæ of different instruments of unequal length, or fix them at a certain angle to the vertical.

M. Blochmann does not attempt to explain why long antennæ are more effective than short antennæ, but this appears to be completely explained by the theory of Prof. Slaby, who has shown that the potential oscillations in a wire connected to earth are like the vibrations in an elastic rod fixed at one end, and therefore greater at the free end the longer the wire is. By combining the contributions of Slaby and Blochmann, we arrive at a theory of wireless telegraphy, which, if not complete in every detail, appears to be correct in the main, and should be of the greatest value to those engaged in the erection and working of wireless telegraph stations. For instance, Blochmann's theory would lead us to predict that the presence of highly electrified clouds between a receiver and a transmitter would render the transmission of messages less effective by the distortion they would produce in the equipotential surfaces; whether or not this has been observed in practice we do not know.—"Electrical Review," London.

New Departure for a Railroad.

North and South Carolina railroads are at loggerheads over the orange traffic. The Great Northern, which has been carrying the fruit eastward from Seattle, Wash., getting it from the latter place by means of boats from the South, is handicapped by the Southern roads refusing to carry the luscious spheres to the coast. The Great Northern threatens to bring its rivals to terms by putting on a line of freight automobiles from the orange districts to the coast during the harvest season. It is the first instance on record where a powerful railroad corporation seeks to obtain business through the medium of the self-propelled vehicle.

MR. EDISON'S LATEST INVENTION.

(From the New York Morning Journal, May 27.)

Thomas A. Edison, the Wizard of Electricity, has discovered how to make "Portland cement" at an extremely small cost.

This statement, at first thought, seems to be comparatively unimportant. Yet Edison knows the immense value of his discovery. He expects that his cement will drive out quarried stone and brick as building materials.

And "the Wizard" foresees as the result of his discovery that it will cost very little to build houses, and that, therefore, rents will be very low; he foresees "small palaces" renting for \$10 a month; he foresees that when houses built of his concrete and steel frames are erected the fire insurance companies will go out of business.

With cement so cheap a house will be "poured," not builded. And the pouring of the house will occupy but a few days. The house will be habitable when the concrete solidifies.

The secret of making Portland cement at a cost so small has only lately been discovered by Mr. Edison. For several years he has been working on the cement problem and the problem of making cheap and practical storage batteries. Both inventions have now been perfected.

The inventor says that cement, combined with steel, will be the building material of the future, and says:

"My impression is that the time will come when each contractor will have standard forms of houses, twenty or thirty varieties. The forms will be made of wood, and a contractor, using one of the standard shapes, will simply go out and 'pour' a house.

"There will probably be hundreds of designs. The contractors will put up their concrete mixer, and have their beams and forms ready. They will pour the form for the first story, and so on.

"To do that all they will require will be common labor—a few men and one boss. That it what I think will be done eventually. And such a house can be made very cheaply. It seems to me that there will not be much use for carpenters then. There will be cabinet-makers to be sure. Why even the floors and stairs will be made of concrete."

Mr. Edison was asked if Portland cement would be cheap enough for general use.

"Yes, I think so," he said, "when the price of cement gets to be \$1 a barrel or \$5 a ton, and people know they can get it for that, there will be enormous quantities of it used."

The inventor said that one part of cement, three parts of sand and five parts of broken stone would be the mixture for concrete, and that broken stone was better than broken brick.

Mr. Edison, in reply to a question as to the thickness of walls in the ordinary workman's house, said:

"The bottom course ought to be of Portland cement, 12 inches, up to the first story, and 8 inches above the first story. The roofs will be of cement also."

To Push Edison Invention.

The Edison Storage Battery Company, capitalized at \$1,000,000, was incorporated Saturday to manufacture Thomas A. Edison's latest invention, the light storage battery.

The incorporation papers were filed in the County Clerk's office in Newark, N. J.

The incorporators named in the papers are Herman E. Dick, of Chicago, and Walter F. Mallory and Walter E. Gilmore, of Orange. Howard W. Hayes is counsel for the company.

It is Mr. Edison's plan to erect in Newark a plant for the manufacture of the new batteries which he believes will revolutionize electric propulsion. Twenty acres of land will be bought and the buildings will be especially adapted to the development of the Wizard's latest invention. Employment will be given to 1,000 men.

LONDON NOTES.

(From our London Correspondent.)

Royal Institution.

Professor Jagadis Chunder Bose, of India, whose discourses before the British Association and Royal Society in London have always been so enthusiastically received, has just been lecturing before the Royal Institution in London on "Response of Inorganic Matter to Mechanical and Electrical Stimulus."

Behr's "Lightning Express" Railway.

For some days past a Parliamentary Committee has been listening to a great deal of technical and general evidence for and against the Manchester-Liverpool mono-rail system or Behr's system. As an instance of the obstinacy of opponents we may cite the remark of one who said that an arrangement for bolting passengers down was necessary to insure safety.

Royal Society Conversazione.

Among the more interesting electrical exhibits at this conversazione were the Poulsen telegraphone, and Mr. W. Duddell's musical arc. Mr. Wimshurst showed photographs illustrating the properties of light emitted by Roentgen tubes, and Mr. Mackenzie Davidson showed stereoscopic transparencies of electric discharges.

Underground Railroads and Vibration.

It will be recalled that last year a good deal was being said about vibration due to the operation of the Central London deep level electric road, and a Parliamentary Committee was appointed to thoroughly investigate the whole subject, so that the exact effects might be known before anything further was done in the construction of the many other lines then projected. The committee has now drawn up a report in which it states that from personal inspection its members are satisfied that "serious vibration was felt in many of the houses on the course of the railway." Self-recording instruments led to the opinion that vibration arose from the large proportion of weight of locomotives not borne on springs and from want of rigidity in the rails. A new type of locomotive had been ordered by the committee from America, and further experiments would be made, and engineers were endeavoring to overcome the difficulties which had hitherto prevented stiffer rails being used. When the results of further experiments were known the committee would give a more definite opinion as to the steps which should be taken on the Central London Railway to reduce vibration, and what features should be introduced on new lines. Meantime from observations made and information obtained, the committee was of

opinion that under proper conditions vibration could be prevented, but abstained from making definite recommendations until these experiments were completed.

Electric Power Supply in London.

The large number of electric power distribution schemes now being projected have led the London County Council to call a conference of all municipal authorities in the London area to discuss whether it is desirable for the Council to secure consent to enable it to supply power in bulk at cheap rates to any of the authorities who may desire to take it instead of putting down new stations or extending the existing ones.

Electricity Supply at Calcutta.

The electric lighting station of the Calcutta Electric Supply Corporation is doing a brisk business and plans are already drawing up for increasing the plant by adding two 1,100 hp. Crompton-Belliss steam generators. A new Alipore station is to be erected on the banks of Tollys Nullah, and it will contain two 60 hp. and two 300 hp. steam dynamos. There are 17 miles of overhead mains and 9 miles of underground. There is a great demand for electric fans and for driving power for them; in fact the Corporation supplies more energy for these purposes than for lighting; 1,100 more fans have just been sent out on the company's own account, and by the end of this season as many as 5,000 will be in use. The units supplied for fan driving alone last year amounted to about 213,000, the lighting supply being 199,000. This year so far the business shows an increase of 130 per cent.

CANADIAN NOTES.

(From our Ottawa Correspondent.)

The Hydraulic Power Company of Peterboro, Ont., is about to build a dam and develop electric power which is to be supplied to the American Cereal Company and other industrial concerns in the vicinity.

The Electric Street Railway at Moncton, New Brunswick, is announced to have been sold to an American syndicate, and it is said that the rails will be taken up and the plant removed.

Prof. R. B. Owens of the electrical department of McGill University, Montreal, and Mr. J. B. Ingersoll, E. E., chief inspector of rolling stock for the Montreal Electric Street Railway, have just completed some interesting experiments with a new roller bearing, the Wright roller bearing journal, designed for all kinds of vehicles, from railway coaches to vehicles for ordinary street traffic. Two street cars on a certain route in the city of Montreal were used, and the object was to show how much electric power could be saved by the new device when contrasted with the journals at present in use in the street railway cars. These cars are at present equipped with the standard journal bearing, and the journey of 10 6-10th miles, covered with a large number of street corner stops, consumed 15,000 watts, or 20.37 horse power, while the Wright roller bearing journal consumed 10,120 watts or 13.43 horse power. The two cars were alike, and were loaded to represent 42 passengers. The testing instruments used were Thomson-Houston recording wattmeters.

For the first time in the province of Ontario, the Appellate Court has held that the rolling

stock of an electric street railway is realty, and that electric cars cannot be seized by creditors having judgments against the company which has given a mortgage upon its property. This important decision, affecting as it does all the electric street railway companies in Ontario, has just been handed down by the Ontario Court of Appeal. By this decision the Bank of Montreal loses, and the bondholders of the Cornwall, Ont., Electric Street Railway Company win in a hard and long-fought battle on their respective claims. The dry law of it is that a moving electric car, passing over the land, is a fixture and passes with the land. Detached, it is regarded as useless, and so is not a "chattel," and cannot be seized as such to satisfy a judgment. The full Court of Appeal for the province has concurred in this view, and the bank will have to resort to a higher court, as it probably will.

Exports of Electrical Material from New York.

The following are the exports of electrical material, from the port of New York, for the week ended May 22:

Antwerp, 102 packages, \$7,680; Argentine Republic, 201 packages, \$7,228; Athens, 9 packages, \$268; Australia, 5 packages, \$69; Brazil, 143 packages, \$1,633; Bremen, 1 case, \$105; British East Indies, 84 packages, \$12,633; British Guiana, 17 packages, \$1,261; British West Indies, 2 packages, \$231; 1 case, \$11; Brussels, 1 case, \$5; Budapest, 4 packages, \$203; Central America, 12 cases, \$237; Chili, 15 cases, \$174; Christiana, 4 cases, \$20; Copenhagen, 1 case, \$25; Cuba, 124 cases, \$4,020; Dundee, 1 package, \$4; Dutch East Indies, 4 packages, \$51; Ecuador, 10 cases, \$310; French Possessions in Africa, 2 cases, \$20; Genoa, 106 cases, \$8,147; Gibraltar, 2 cases, \$40; Glasgow, 36 packages, \$5,000; 19 packages electrical cable, \$4,750; Hamburg, 39 cases, \$1,286; Havre, 75 packages, \$2,575; Japan, 223 packages, \$17,457; 136 cases, \$25,613; Leeds, 4 packages, \$710; Lisbon, 87 packages, \$9,977; 6 packages electrical cars, \$35,924; Liverpool, 146 packages, \$12,756; London, 302 packages, \$28,230; 24 rolls electrical cable, \$4,504; Manchester, 105 packages, \$15,432; Marseilles, 6 cases, \$500; Mexico, 7 cases, \$1,183; Naples, 2 cases, \$77; Perm, 7 packages, \$270; Philippines, 51 packages, \$1,001; Preston, 1 package, \$30; Siam, 63 packages, \$3,009; Southampton, 3 packages, \$300; 6 cases, \$1,166; Stockholm, 7 packages, \$800; Uruguay, 12 cases, \$238; U. S. Colombia, 13 packages, \$569; Venezuela, 33 packages, \$460.

INCORPORATIONS.

The Electric Dispatch Company, Detroit, Mich.—to do a freight and express carrier business. Capital stock, \$100,000.

The Kay Electric Dynamo & Motor Company, Toronto, Ont. Capital stock, \$40,000. Provisional directors: Thomas L. Kay, William E. Mulholland and Orlando Kellond.

The Iroquois Electric Light & Power Company, Ltd., Toronto, Ont. Capital stock, \$10,000.

The Kennebunkport Light & Power Company, Sanford, Me.—to supply gas or electricity for lighting and heating. Capital stock, \$10,000. Officers: President, E. P. Libbey; treasurer, A. J. Robinson, both of Sanford.

The Hetyl Hydro-Carbon Heat & Power Company of Philadelphia, Wilmington, Del. Capital stock, \$100,000.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED MAY 21, 1901.

ELECTRIC RAILWAYS AND APPLIANCES.

674,458. Closed-Conduit System of Electric Railways. Frederick C. Eamond, Brooklyn, N. Y., assignor to the Es-

mond Electric Traction Company of West Virginia. Filed Nov. 21, 1899.

674,467. Line Conductor for Electric Railways. Alexander Palmros, Fairmount, W. Va., assignor to the Jeffrey Manufacturing Company, Columbus, O. Filed Jan. 12, 1901.

674,523. Automatic Signal for Electric Railways. Charles H. Storm, Waterloo, Ia., assignor to himself, Ralph L. Storm, Edwin M. Storm and Charles S. Chase, same place. Filed Aug. 28, 1900.

674,589. Trolley. Joseph Trickett, Reading, Pa. Filed Nov. 10, 1900.

674,617. Trolley-Wire Clip. James W. Perry, Philadelphia, Pa., assignor to the H. W. Johns Manufacturing Company of New Jersey. Filed April 6, 1901.

674,656. Hanger-Clamp for Trolley-Wires. George H. Riecke, Cincinnati, O., assignor, by direct and mesne assignments, to Samuel K. Druce, John Asa Hosbrook and Daniel S. Hosbrook, Madeira, O. Filed Dec. 28, 1900.

674,657. Trolley-Wire Supporting and Connecting Device. George H. Riecke, Cincinnati, O., assignor to Samuel K. Druce, John Asa Hosbrook and Daniel S. Hosbrook, Madeira, O. Filed March 21, 1901.

674,660. Electric Signaling Device. Conrad F. Wilder, Chicago, Ill., assignor of one-third to Henry Kamm, same place. Filed Nov. 7, 1900.

674,740. Trolley. Alexander Palmros, Columbus, O., assignor to Joseph A. Jeffrey, same place. Filed Oct. 6, 1899.

ELECTRIC LIGHTS AND APPLIANCES.

674,643. Electric-Arc Lamp. Royal E. Ball, New York City, assignor to the Ball Electric Company, Yonkers, N. Y. Filed April 11, 1900.

674,770. Electric Lamp. Cloice B. Hull, Chicago, Ill. Filed Jan. 30, 1901.

ELECTRICAL MACHINERY AND APPARATUS.

674,505. Armature-Core. Henry E. Heath, Windsor, Conn., assignor to the Eddy Electric Manufacturing Company, same place. Filed Oct. 4, 1900.

674,676. Apparatus for Generating and Supplying Motive Power to Motors. Louis E. H. Fievet, Paris, France. Filed March 20, 1899.

674,796. Machine for Forming Insulating-Bushings. Henry T. Palste, Philadelphia, Pa. Filed March 18, 1901.

TELEPHONES AND TELEPHONE APPARATUS.

674,402. Telephone-Switchboard. Harold A. Douglas, Grand Rapids, Mich., assignor to Peter C. Burns, Chicago, Ill. Filed Nov. 2, 1898.

674,515. Calling Apparatus for Party Telephone-Lines. Joseph J. O'Connell, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Dec. 26, 1899.

674,541. Protector for Telephone or Telegraph Instruments. Jean Piel, Schöneberg, near Berlin, Germany, assignor to Aktiengesellschaft Mix & Genest, Telefon-und Telegraphen-Werke, Berlin, Germany. Filed Nov. 2, 1900.

674,807. Telephone System. Ernest E. Yaxley, Chicago, Ill., and Charles C. Cadden, Cleveland, O. Filed Dec. 16, 1899. Renewed April 11, 1901.

MISCELLANEOUS.

674,372. Automobile Vehicle. James C. Anderson, Highland Park, Ill. Filed Sept. 6, 1900.

674,396. Push-Button. Sigmund Bower, Brooklyn, N. Y. Filed Nov. 26, 1900.

674,407. Mold for Framing Electrodes. Robert J. Guisler, Charlottenburg, Germany. Filed June 28, 1900.

674,427. Apparatus for Collecting Atmospheric Electricity. Andor Palencsar, Budapest, Austria-Hungary. Filed July 10, 1900.

674,469. System of Typewriting Telegraphs. Frank B. Pearne, Grand Island, Neb. Filed Dec. 11, 1900.

674,501. Storage Battery. William Gardiner, Chicago, Ill. Filed Aug. 8, 1900.

674,575. Phonograph. Augustus L. Duweliuss, Cincinnati, O., assignor to Alfred H. Duweliuss and Walter S. Duweliuss, same place. Filed June 20, 1898.

674,665. Power-Transmitting Means for Horseless Carriages. John C. Blevney, Newark, N. J. Filed Jan. 23, 1901.

674,683. Electromagnetic Valve. Nils O. Lindstrom, Borough of Queens, New York City, assignor to Alonzo B. See and Walter L. Tyler, same place. Filed Feb. 4, 1901.

674,780. Electrolytic Process of Purifying Crude Spirits. Jules H. Lavollay and Gustave E. Bourgois, Paris, France. Filed June 8, 1900.

674,794. Power-Transmission Gear. Herbert G. Ogden, Jr., Washington, D. C., administrator of Herbert Churchill Capel, deceased. Filed Dec. 15, 1900.

674,825. Apparatus for Accumulating and Storing Energy. Angel de Castro, New York City, assignor of one-half to Henry W. Schlomann, same place. Filed April 10, 1900.

674,840. Circuit-Controller. Carl Hoffmann, Charlottenburg, Germany, assignor to the Siemens & Halske Electric Company of America, Chicago, Ill. Filed March 10, 1900.

674,846. Electric Telegraphy. Oliver J. Lodge, Liverpool, Eng. Filed Dec. 20, 1897.

THE TELEPHONE WORLD.

Value of Telephone Lines.

In the People's Telephone Company's office in Detroit, Mich., was recently exhibited a compilation by Judge Thomas, president of the Independent Telephone Association of Ohio, designed to show the value of United States telephone systems and the great growth in the independent telephone movement. Judge Thomas figures that the total valuation of Bell properties in the United States is \$300,000,000, and of the independent properties \$200,000,000. The figures were made by Judge Thomas after published rumors that all Bell telephone companies would be brought together in one corporation with a capitalization of only \$90,000,000.

Forts Michie and Terry, the new Government fortifications protecting the eastern entrance to Long Island Sound, are to be equipped for telephonic and telegraphic communication. The forts are located on Plum and Gull Islands in the Race across from New London harbor. During the late war a cable was stretched across from New London connecting the forts, but the cable was damaged in the seaway and the service was not continued. The proposed cable will be laid under the supervision of Capt. Nelson Samuel Raver. The cable will be laid from the fortifications to Goshen Point, and there it will be connected with the terminal of the Southern New England Telephone Company at New London.

The Dubois County, Ind., Telephone Company, which has been working in the vicinity of Jasper for some weeks, has opened its exchange in that place to the public, and all subscribers have free service to Tell City, Cannelton, Troy, St. Meinrad, Gentryville, Dale, Leavenworth, Corydon, Marango and all towns along the Air-Line east to New Albany, Salem, Paoli, West Baden, French Lick, Winslow, Petersburg, Washington and a score of other towns.

A report from Sioux City, Ia., states that the Western Electric Telephone Company has come into possession of the Greene & Western Company's system, including 450 miles of toll line and exchanges at Mason City, Charles City and Osage in that State. The concern now reaches every town in the northwestern twenty-six counties of Iowa, with a number of local exchanges. Three hundred miles of toll lines are to be built in Minnesota and South Dakota.

According to a Kansas City paper, sixteen Missouri telephone lines, owned and operated by the Standard Telephone Company, were ordered sold by Judge Gibson recently. The court's order provides for a public sale at the county court house in that city between the hours of 2 and 5 o'clock on the afternoon of June 5. Clarence S. Palmer, receiver for the company, was authorized to sell the property to the highest bidder.

The Pennsylvania Telephone Company has made arrangements to put up larger cables between the local exchange and Harrisburg. The cables are now on hand, and will be placed in position within a short time. The work of erecting poles in place of those worn out by long usage has been about completed, and the force of linemen will soon be started at their portion of the improvement.

L. E. Samson, of Tacoma, Wash., has applied to the city council for a 25-year franchise for a new telegraph and telephone system. The names of his principals have not been disclosed. Independent systems exist at Portland and Seattle. It is believed that they will be connected by another long-distance line, of which the proposed new system there will be a part.

The Eastern Telephone & Telegraph Company is to extend its lines to Atlantic City and Cape May, N. J. This was decided upon at the annual meeting of stockholders. Connections will also be made with the Keystone Company of Philadelphia. The company has spent about \$150,000 in extending its service during the past year.

The Cynthiana, Ky., Telephone Company has amended its charter and increased the capital stock to \$30,000. This company is preparing to run lines to nearly every postoffice in Harrison County, and will connect with exchanges of adjoining counties.

The New England Telephone & Telegraph Company will erect an exchange in Holyoke, Mass. The equipment will be equal to that of any exchange in New England.

The Delmarva Telephone Company has been granted permission to construct a line from Iron Hill to Perryville, with connections at Elkton, Northeast and Principio, Md.

Construction work on the Madisonville, Tenn., telephone exchange has been completed.

Telephone Rates in Washington.

Last week the Court of Appeals of the District of Columbia affirmed the constitutionality of the act of Congress of 1898 reducing by about 40 per cent. telephone rates in the city of Washington, thus reversing the judgment of Justice Barnard of the Supreme Court of the District of Columbia.

The telephone company refused to reduce its charges to the rates fixed by the act, alleging it unconstitutional for the reason that it interfered with chartered rights and the service could not be performed at the prices fixed. Justice Barnard held the act unconstitutional and the case was carried to the Court of Appeals, which reversed that judgment and directed the granting of the injunctions. An appeal will probably be taken to the Supreme Court of the United States.

There is pending before the board of public works a petition on the part of the Seattle, Wash., Electric Company for a permit to establish a system of telephone boxes and booths for use in connection with the street railway lines of the company. The system is very similar to that in use by the police department, and contemplates furnishing a means for immediate communication with headquarters by any motorman or conductor whose car is in trouble from any cause. It frequently happens that in the suburban districts especially a car becomes derailed or in some other difficulty. The motorman is sometimes detained many minutes in seeking a telephone by which to communicate his difficulty to the power house. The proposed system would furnish regular opportunities for such communication, and would obviate many delays and difficulties to which the traveling public might be, and indeed is, subjected. It is probable that the permit asked for will be granted in a modified form, restricting the telephone to the outlying districts, and limiting the company to the use of boxes in the downtown sections.

The petition of its New England Telephone Company for the privilege of putting its wires underground, will probably be considered at the next meeting of the board of Burlington, Vt., aldermen. The cost of the work has been figured at from \$15,000 to \$20,000, and will include changing the wires on a number of streets. The work, if sanctioned by the aldermen, will be done at once, as the exchange is likely to be moved into larger quarters and the service improved. These improvements are promised if the company is allowed to put its wires underground.

J. E. Mott is in Pueblo, Col., from Michigan, representing an Eastern telephone company, which he says is headed by Matthew Fluh of Mt. Clemens, Mich. He is trying to interest the business men in a new telephone system which he proposes to introduce, providing he can get the necessary franchise from the city council. He claims the new 'phone will be much cheaper than the present service, and will be rented at a reduction of about 40 per cent. on the present prices. He will appear before the council with his proposition at its next meeting.

The entire business of the Central Telephone Company of Des Moines, Ia., which is a toll line system, was lately sold to the Jasper County Telephone Company, which has headquarters at Newton, Ia. The Central has operated 31 telephone stations in Central Iowa, extending from Boone to Oskaloosa.

Assemblyman Gilman, Attorney Linderman, of Osseo, Wis., and other prominent men interested in the Osseo Telephone Company, have recently been in Eau Claire, and at the council meeting the company's application for a franchise in Eau Claire was presented and ordered published.

The Independent Telephone Company of Waco, Tex., has obtained permission from the city council of Marlin to extend its line into the latter city and open an exchange there. Work on this extension is to commence at once.

The Brilliant, O., town council has granted a franchise to the Phoenix Telephone Company to put in an exchange at Brilliant. A wire will connect Brilliant and Wellsburg, crossing the river at about the central part of the town.

The New York Telephone Company has bought three three-story dwellings, Nos. 123-127 East 124th street, adjoining its present exchange in this city. An addition will be built with a frontage 49.4 feet.

The extension of the Anderson telephone line from Plantersville to Bobbin, Tex., was completed recently.

Work on the telephone system at Woonsocket, S. D., has been completed, and the plant is now in use.

Ericsson 'Phones Popular in India.

The following information on a postal card received from British India is interesting, as it was from a telephone exchange wholly unknown to the Ericsson Telephone Company until the postal card arrived. The particular item of interest is the fact that Ericsson telephones are used and appreciated even in India:

Hyderabad Deccan Telephone Exchange.

Hyderabad Deccan East India.

12th February, 1901.

Manager Ericsson Telephone Company, 305 Broadway, New York City, U. S. A.

Dear Sir: Messrs. Ericsson & Co., of Stockholm, have kindly sent me Part 4 of your "Telephone Information." Please send me Parts 1, 2 and 3 to complete the series. The "Ericsson" telephone sets are the best in the world and we use them here.

Yours faithfully,

H. NEALE, Sup't.

Milwaukee, Wis., will have another telephone company shortly, articles having been filed with the register of deeds incorporating the Kurtz National Telephone Company. This company will construct and operate telephone and telegraph lines, manufacture telephones and electrical apparatus. The capital of the company is \$35,000 in shares of \$10. The incorporators are: J. W. Murphy, J. M. Clarke and P. J. Schmitt.

The Nebraska Telephone Company in Wymore is removing wires and substituting cables, each of which hold 100 wires. Improvements now under way will increase the capacity of the exchange to 400 instruments, more than half of which have already been placed. Connections with the line down into Kansas via Barneston have been completed.

Without solicitation by their employees, the Southern New England Telephone Company has announced a new working schedule which will make a nine-hour day. Nearly 200 men scattered all over the State of Connecticut will benefit by this act of the company. The new rule goes into effect on June 2.

The Dutchess County Telephone Company, which is now placing a telephone system in Poughkeepsie, N. Y., has filed a mortgage of \$100,000 in the office of the county clerk. The idea is to secure bonds for a like amount to be issued and sold. The mortgage is made out to the Phoenix Telephone Company.

Articles of incorporation of the new People's Telephone Company, recently organized in Detroit, Mich., to compete with the Bell Company, are ready to be filed at Lansing as soon as signed. The capital stock is \$2,500,000, 70 per cent. owned by the Everett Moore syndicate, of Cleveland, and 30 per cent owned in Detroit.

The people of Pine and Buffalo, Col., are rejoicing over the prospect of soon being in telephonic communication with the outside world. Work has begun on a branch from the toll road line, which will come down Elk Creek canon to Pine, and then down Platte canon to Buffalo. The contractors expect to complete the work by June 1.

Charles R. Duffin, of Terre Haute, Ind., vice-president and general manager of the Citizens' Telephone Company, appeared before the city council at Brazil in that State in the interest of the new independent telephone company which is seeking a franchise there.

The refusal of the common council to grant the Century Telephone Construction Company a franchise will not prevent the installation of a third system of telephonic communication in Ithaca, N. Y.

TELEPHONE INCORPORATIONS.

The Springfield Home Telephone Company, Springfield, O. Capital stock, \$300,000.

The Interstate Telegraph & Telephone Company, Ashdown, Ark. Capital stock, \$50,000. Incorporators: Wm. M. Freeman and Frank A. Locke, Ashdown; Lawrence A. Byrne, Texarkana.

The Wakarusa Telephone Company, Wakarusa, Ind., Capital stock, \$10,000. Directors: George D. Lint, Charles W. Miller and Frank W. Brown.

The Antiseptic Telephone Appliance Company, Jersey City, N. J. Capital stock, \$500,000. Incorporators: Edw. S. Chambers, Thomas A. Hickey and Paul Ryder, all of Jersey City.

The Valley Telephone Company, Wilmont, O. Capital stock, \$1,000. Incorporators: J. W. Moyer, E. C. Cotton, H. F. Christman, J. O. Newcomer and A. L. Deal.

GENERAL ELECTRICAL NEWS.

Lighting.

Clarksville, Ga.—This town will vote June 10 upon the issuance of \$10,000 of bonds for an electric light plant.

Cleveland, O.—Sealed proposals will be received by the county commissioners of Cuyahoga County at their office in the old court house, until 12 o'clock M. June 5, 1901, for the furnishing of apparatus and erecting same, or parts thereof, at the option of the bidder, necessary for the electric light plant to be installed in the old court house in this city and in accordance with the plans and specifications on file in the office of the county commissioners and in the office of George S. Rider, consulting engineer, Century Building, Cleveland, O.

Clarendon, Tex.—The Clarendon Electric Light & Power Company has been organized with \$6,000 capital stock, for the establishment of an electric light plant.

Council Bluffs, Ia.—The Council Bluffs Gas & Electric Light Company is preparing to erect its new electric light plant.

Danville, Va.—The electric light plant here has been shut down on account of the floods.

Douglas, Ga.—G. Young of Atlanta will apply for a charter to erect an electric light plant here.

Elyria, O.—The Elyria Gas & Electric Light Company has in contemplation extensive additions to its electric light plant.

Ellisville, Miss.—T. V. Hall, civil engineer of West Point, Miss., has been appointed consulting engineer to design and supervise the proposed \$15,000 electric light plant here. The contract will be let June 15.

Emporium, Pa.—G. Metzger has been awarded the contract for the construction of an electric light plant at this place.

Fishkill Landing, N. Y.—It is announced that the Rhinebeck Gas Company will go out of business, the company having lost all except six of its customers through electric light competition.

Georgetown, Ky.—An electric light plant will soon be built here.

Glencoe, Minn.—The Glencoe Electric Light Company has been incorporated with the Secretary of State, capitalized at \$25,000.

Henderson, Tex.—This place will have an electric light plant in the near future.

Houston, Tex.—An ordinance was recently passed ordering an election to vote for an additional \$100,000 for an electric light plant.

Independence, Mo.—The chairman has appointed a committee consisting of Mayor Woodson and Councilmen White and Minarup to look into the matter of selecting a location and constructing an electric light plant.

Kingsley, Ia.—The question of erecting an electric light plant here is being agitated.

Marion, Ky.—The Marion Light & Ice Company will erect an electric light plant.

McKeesport, Pa.—P. J. Murphy, a member of the council, has presented an ordinance authorizing the city controller to advertise the sale of \$50,000 in bonds for the erection of an electric light plant.

Monticello, Ga.—Bonner Jordan has received a franchise for an electric light plant in this city.

Newark, N. J.—Electric lighting of the city by a plant owned by the city is being considered by the board of works.

North Platte, Neb.—Lester Walker, who was granted a franchise for the construction of an electric light plant here, has decided to accept the terms and will start work at an early day.

Pana, Ill.—Pana is figuring on erecting an electric light plant.

Pierre, S. D.—The Pierre city council is considering a proposition to put in an incandescent electric lighting system.

Pratt City, Ala.—E. Hudnall and associates have petitioned this city for a franchise for the erection of an electric light and power plant.

Rockville, Md.—The power house, which furnished electric lights and the water pump for this place, with

all machinery and apparatus, was totally destroyed by a recent fire. The loss is estimated at \$7,000.

Rockingham, N. C.—Rockingham wants bids and specifications for an electric lighting plant. Address H. L. Ledbetter, chairman.

Statesboro, Ga.—The Statesboro Manufacturing Company is in the market for machinery for electric lighting purposes. Address D. P. Averitt.

Tekamah, Neb.—An electric light plant will soon be built here.

Victor, Col.—The Pike's Peak Power Company has been granted permission to erect an electric light plant here.

Street Railways.

Ann Arbor, Mich.—W. B. Hatch of Detroit has asked the city council of this place for a franchise for an electric road from Adrian to Ann Arbor.

Cleveland, O.—The Southern Ohio Traction Company, controlled by Cleveland capitalists, has announced its intention to build two new roads to be operated in connection with its main line. The Hamilton, Oxford & Western Railway will extend from Hamilton to Oxford and College Corner into Indiana.

Clinton, Ill.—H. W. Knight, representing Eastern capitalists, who are promoting the proposed electric railway from Lexington to Decatur through this place, is arranging to secure a franchise to run the road through Clinton.

Findlay, O.—An electric road from here to Ft. Wayne, passing through Columbus Grove and Kalida, will probably be built soon.

Huntsville, Ala.—Surveys are about completed for the extension of the Huntsville Electric Railway line of which T. C. Dupont is president.

Kaukauna, Wis.—The Wisconsin Traction, Light, Heat & Power Company has been given the right to construct tracks in the limits of this city on certain streets.

Lehigh, Pa.—I. A. Sweigard of the Reading Terminal has perfected arrangements for the erection of a large power house here for the Carbon County Electrical Railway Company. Estimated cost, \$75,000.

Lenox, Mich.—Much interest is felt over the proposed new electric railway from here to Sanilac Center, of which Gil R. Lovejoy, the treasurer of Macomb County, is a promoter. Mr. Lovejoy says the road is a sure thing and that the money is ready as soon as the details are arranged.

Lima, O.—The Lima, Delphos, Van Wert & Ft. Wayne Traction Company has been incorporated by Lima and Cleveland capitalists. The line will parallel the Pittsburgh, Ft. Wayne & Chicago branch of the Pennsylvania system.

North Salem, N. Y.—The Golden Bridge Electric Railroad Company has been incorporated to construct and operate a street surface road between here and Ridgebury, Conn., with a capital of \$100,000. E. B. Brady of Golden Bridge, F. W. Siebert of Waterbury, Conn.; William H. I. Howe, and John Brophy of Ridgefield, Conn., are all interested in the scheme.

Penn Yan, N. Y.—At the annual meeting of the stockholders of the Newark-Marion Electric Railway Company, C. L. B. Tylee of this place was elected president and general manager. The work of building the road is expected to begin June 1.

Richmond, Va.—A company has been formed for the construction of an electric line from Fulton to Warwick Park on the river, about six miles below this city. All the necessary stock has been subscribed.

Spokane, Wash.—A new electric line is under consideration. It is to run from this city north to the granite quarries on the Little Spokane River, and will make possible cheap transportation to summer resorts in a picturesque section of country.

West Chester, Pa.—A number of Chester County people have organized a movement with the object of connecting Oxford and Parkersburg by trolley. The proposed road will be 14 miles long, and will touch Cochranville. A company has already been organized

under the name of the Oxford, Cochranville & Parkersburg Electric Railway Company, and a charter will be applied for immediately. The officers are: President, Thomas O'Connell; secretary, Robert L. Hayes; treasurer, Plummer E. Jefferis.

Manufacturing.

Buffalo, N. Y.—The Electric Typewriter Company has been formed to manufacture typewriting devices, with a capital of \$100,000. James A. Roberts, Edward Michael and Joseph B. Roberts of Buffalo, Joseph L. McEntee of Albany, and Harry Bates of Rensselaer, are the directors of the concern.

Butler, Pa.—The United States Electrical Manufacturing Company, capitalized at \$100,000, was organized a short time ago.

Watertown, N. Y.—Articles incorporating the Eager Electric Company of this city have been filed at Albany. It is proposed to manufacture and sell electric machinery. Henry Eager Frank M. Bosworth and Albert H. Lafebre, of Watertown, are the promoters of this concern, which is capitalized at \$10,000.

Company Matters.

Chicago.—The Graham Manufacturing Company of this city has changed its name to the National Gas & Electric Fixture Company.

New Market, N. H.—At a recent meeting of the stockholders of the Newmarket Electric Light, Power & Heat Company, held a short time ago, it was voted to increase the stock \$12,000, making the total amount of the capital \$22,000.

New York City.—A new company purposes to install a pneumatic tube service between this city and Boston, under the name of the Electric Pneumatic Company of Hartford. The incorporators, who are Connecticut men, represent interests in New York and Boston, and intend to equip a through express service between those two cities, connecting with all the important centers on the way. The company starts in with \$5,000,000 capital stock.

Power and Transmission.

Philadelphia, Pa.—Rumors are now afloat to the effect that a syndicate composed of Philadelphia and New York capitalists have arranged to acquire control of the project, first suggested in Baltimore, to utilize the water power of the lower Susquehanna River in Maryland for the generation of electricity on a large scale.

York, Pa.—The project of harnessing the Conewago Falls, on the Susquehanna River at York Haven, 10 miles from here, will soon be an accomplished fact. Judge Stewart, who has had this matter in charge for several years, has announced that he has sold all the bonds necessary to develop the property to a banking company of Philadelphia, and the first payment will be made on June 1, and the work of development will be pushed to a speedy conclusion. The first line for transmission of current will be built to this city, and other lines to Lancaster and Harrisburg.

Mines.

Denver, Col.—The Woods Investment Company, operating a lease on the May Belle claim of the Cripple Creek Gold Exploration Company, known as the Lawrence Townsite, has installed an electric hoist on the property and commenced sinking the shaft to the 500-foot point. The hoist is run by power from the Pike's Peak Power Company.

Automobiles.

Wilmington, Del.—The Observation Automobile Company of Washington, with a capital of \$100,000, was lately incorporated here to build, operate, sell and lease automobiles for the transportation of passengers.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 17@17¼c.; Lake, 17¼@17½c.; casting, 16¼@17c.

The purchase, is reported of the Northern New York Telephone Company by the Hudson River Telephone Company for \$100,000.

The directors of the London and River Plate Bank, Ltd., London have declared a dividend of 8 per cent. for the six months ending March 31.

The stockholders of the Empire City Subway Company, Ltd., of New York have voted to increase the capital stock from \$1,750,000 to \$2,250,000.

Gross earnings of the Massachusetts Electric Companies are said to be showing a steady increase of about 10 per cent. as compared with a year ago.

It is stated that Charles T. Verkes has sold the 25,000 shares of the Chicago Union Traction Company stock to the Blair-Ryan syndicate at a figure much better than was bid by that syndicate when they purchased his other street railway holdings last winter.

The Philadelphia Bell Telephone Company stockholders approved on May 21 the increase in capital stock from \$6,000,000 to \$8,000,000. \$1,000,000 new stock will be issued at once. Stockholders on record Monday have the right to subscribe to 16½ per cent. of present holdings at par until June 18.

The following are quotations for some of the industrial stocks not quoted elsewhere: Electrical Lead Reduction, 3@4; Electric Boat, 16@20; Electric Vehicle, 10@18; Tel. & Tel. Company of America (full paid) 5@6½; Electric Company of America, 9@9½; National Carbon, 15½@16.

A special meeting of the Brooklyn Elevated Railroad will be held June 25 to ratify the lease of the company's property, to the Brooklyn Heights Railroad for 999 years. The lease will include all the property rights and franchises and other privileges of the Brooklyn Union Elevated Railroad, except its franchise to maintain a corporate existence.

Advices from Boston state that the entire \$7,500,000 Erie Telephone notes, representing the loan due January 10, 1902, have been disposed of. Of the \$7,500,000, there was withdrawn at the start, \$1,500,000 for investment; an option on \$1,200,000 or 20 per cent. of the \$6,000,000 was given to certain interests, and \$4,800,000 was offered to the public by a banker's syndicate. The \$4,800,000 have all been sold and the option on \$1,200,000 has been exercised.

The New York "News Bureau" says that a member of a prominent banking house that has been closely identified with the management of the American Telephone and Telegraph Company says that he believes the new stock, shortly to be issued, will not be offered to stockholders at par, but at a price considerably higher—probably at 130, or thereabouts. He also expressed the opinion that an amount of stock equal to that now held in the treasury—about \$38,000,000—will be offered in \$10,000,000 share lots within a comparatively short time after the increase is authorized.

The details for the merger of the Consolidated Traction Company of Pittsburgh with the Philadelphia Company of that city have been practically agreed upon. It is understood that stockholders in the Philadelphia Company will receive par in 5 per cent. bonds and 20 per cent., or \$10 in common and preferred stock of the new company. It is believed that the new company will be incorporated under the laws of New Jersey with a capital of \$40,000,000, the bonds to be secured by depositing in trust the stock of the constituent companies.

The Chicago Union Traction Company has decided not to refund at present the outstanding West Chicago Street Railroad certificates of indebtedness. Arrangements had been under consideration for the refunding of the certificates on a 4½ per cent. basis. They bear 6 per cent. now. Notice was given on March 27 that the certificates would be paid on June 1. The total amount outstanding is \$497,000 and they were issued on December 1, 1894, each of the denomination of \$1,000. The company will wait for a more favorable money market before refunding the issue.

The agreement on consolidation of the New York Gas and Electric Light, Heat and Power Company with the Edison Electric Illuminating Company, of New York was filed with the Secretary of State on May 23. The title of the new corporation is the New York Edison Company and its capital is \$45,300,000, the aggregate of the capital stock of the two companies consolidated. The directors are Anthony N. Brady, Harrison E. Gawtry, Stephen S. Palmer, Thos. E. Murray, Samuel A. Beardsley, Nicholas F. Brady and Lewis B. Gawtry, of New York City.

The terms upon which the shares of the Electric Company of America and the shares of the American Railways Company are to be purchased have been agreed upon and are stated officially as follows: A new company is to be formed with the following capitalization and bonded indebtedness: Common stock, 100,000 shares at \$50 each, \$5,000,000; preferred stock, 50,000 shares at \$50 each, \$2,500,000; bonds, 4 per cent., \$15,000,000. The preferred stock is to be entitled to dividends up to 5 per cent., but the dividends are not to be cumulative. It may be retired at par and it may subsequently be changed for common stock.

The general balance sheet of the Metropolitan Street Railway system of New York as of March 31, 1901, shows: Assets—Cost of road, etc., \$35,360,004; stocks and bonds, \$21,767,398; new construction on leased lines, etc., to be distributed, \$17,210,903; improvements, additions and betterments, \$2,280,598; cash on hand, \$11,528,096; bills receivable, \$662,209; office furniture, \$18,753; total, \$89,002,325. Liabilities—Capital, \$51,987,300; funded debt, \$21,750,000; bills payable, \$1,600,736; interest on funded debt, \$137,525; rentals accrued, \$324,386; dividends unpaid, \$909,748; bond proceeds to credit of Metropolitan Street Railway Company, lessee, Third Avenue construction account, \$9,802,864; open accounts, \$811,694; profit and loss surplus, \$1,642,070.

EDITORIAL NOTES.

"Electricity's" Educational Series.

With this issue of *ELECTRICITY* the able series of
educational articles by Mr.
R. Max Eaton, which has
been running for the past
seven months, comes to an end. These element-
ary articles have unquestionably met a long
felt want and have proven most acceptable to
workers in the electrical field, as evidenced by
the number of pleasant things that have been
said about them by practical men. Our object
in running this series was as originally stated
to place before central station men matter
that could readily be understood and that
would tend to benefit them in their profession,
and we feel that to a great extent our pur-
pose has been accomplished.

In the very near future we shall give to our
readers a series of articles on the principles of
dynamo design by an authoritative writer,
which should prove of great value to electric-
ians employed in electrical manufacturing
establishments. These articles will be illustrat-
ed and will contain no more mathematics than
is absolutely necessary to explain and deter-
mine the points at issue.

In concluding it might be well to state that
there are a few complete sets of Mr. R. Max
Eaton's Educational Series still on hand, from
November 14 to date, which may be obtained at
the usual subscription price.

The Passing of the Cable.

The Broadway cable system,
which was built by the Met-
ropolitan Street Railway
Company some nine years
ago, was superseded on the night of May 25-26
by the underground trolley. The feat accom-
plished by the engineers of the above company
was a notable one, as more than fifteen miles
of surface car lines were converted from cable
power to electric power in a little less than
twenty-three hours.

The last cable car to run over the Broadway
tracks on Saturday night, May 25, finished its
last trip at 9 o'clock. The first electric car to
run over the first section, between 15th street
and 54th street, started at 7:40 o'clock on the
night of May 26. In that time all of the old
cables were drawn from the conduits on Broad-
way, Columbus and Lexington avenues, the
stationary machinery in the conduits was re-
moved and the new electric rails were in-

stalled. At 7 o'clock on the night of May 26
the installation of the electric rails in the con-
duits was completed. Then the connection
with the power house was made for a test—
and after that the first car was run out.

On May 27 the electric system was in full
operation and no accidents or trouble worth
speaking about occurred, if the blowing of a
fuse or two is excepted.

In the history of American street railways
no more costly step for the betterment of a
road has been taken than that which the Met-
ropolitan Company has carried into effect. It
cost \$16,000,000 to build the cable system that
was operated in Broadway, Columbus and Lex-
ington avenues. Of that outlay there re-
mains a salvage of \$10,000,000, chiefly in track-
age and real estate. The remainder, according
to Mr. Vreeland, is old scrap. Great as the
cost to the company has been in making this
change, new work in the line of improvement
has been ordered. Seventh avenue is to be
equipped with electricity at once, and the long
delayed Kingsbridge line is to be built this
summer.

The passing of the cable and the adoption of
electricity cannot fail to be duly appreciated
by the public, if for no other reason than the
doing away with the sudden jerk which in-
variably accompanied the starting of a cable car
on Broadway.

* * *

The Edison Electric Storage Battery.

Considerable interest has
been aroused in scientific
circles over the electric
storage battery recently
invented by Thomas A.
Edison. As is well-known the batteries now
generally in use have their limitations, and
although of great value in central station
work leave much to be desired when it comes
to other applications, such as the propelling of
street cars or automobiles. The principal
trouble has been that batteries were not ef-
ficient enough for their weight; they deterio-
rated too rapidly and had to be renewed too
frequently. Furthermore the cost of renewal
both in time and money was by no means in-
significant, which combined with the other
drawbacks practically prohibited their use in
cases where the batteries had to be carried
by the vehicle which they were to propel.

At a meeting of the American Institute of
Electrical Engineers on May 21 in this city Dr.
Arthur E. Kennelly described the Edison Stor-

age battery at considerable length. Realizing that the existing type of battery left much to be desired Mr. Edison, according to the author, set before himself the following five points of excellence which the new battery cell he was to invent must possess: 1. Absence of deterioration by work. 2. Large storage capacity per unit of mass. 3. Capability of being rapidly charged and discharged. 4. Capability of withstanding careless treatment. 5. Inexpensiveness.

All of these advantages are claimed to be possessed by the new battery. The negative pole, or positive element, corresponding to the zinc of a primary cell, or the spongy lead of a secondary cell, is iron. The positive pole or negative element, corresponding to the carbon of a primary cell, or lead peroxide of a secondary cell, is a superoxide of nickel believed to have the formula NiO_2 . The cell is therefore a nickel-iron cell, a name which suggests the structural material—nickel-steel. The electrolyte is potash; viz., an aqueous solution containing from 10 to 40 per cent. by weight, but preferably 20 per cent. of potassium hydroxide, the freezing temperature of which is 20 degrees below zero F. or—30 degrees C.

The advantages of the Edison battery over the modern lead battery are forcibly pointed out by Dr. Kennelly. He says:

"In practice, the storage energy per unit mass of the modern lead battery, is from 4 to 6 watt-hours per pound of battery (8.8 to 13.23 watt-hours per kilogram. Expressed in another way, a battery weighs from 124.5 to 186.5 lbs. per horse-power-hour at its terminals (75.5 to 113.4 kilos per kilowatt-hour); or, if its stored energy available at terminals were all expended in gravitational work, a battery could raise its own weight through a vertical distance of from two to three miles (3.2 to 4.8 kilometers)."

In the Edison battery the storage energy per unit of mass is given as 14 watt-hours per pound of battery, or in other words, the weight of the battery per unit of electric energy at its terminals is 53.3 lbs. per horse-power-hour. Thus it will be seen that the Edison battery will accomplish the same work as the modern lead battery and will weigh only about one-third as much.

The make-up of the new battery is described as follows:

"The positive and negative plates are mechanically alike, and can scarcely be distinguished by the eye. They differ only in the chemical contents of their pockets. Each plate is formed of a comparatively thin sheet of steel, 0.024 inch (0.61 mm.) in thickness, in which rectangular holes are stamped, so as to leave a grid or frame somewhat resembling a window frame. Each opening or recess is filled with a pocket or shallow box containing the active material. These boxes correspond to the panes of glass in the window-frame analogy.

"The positive briquettes (zincs of a primary cell) are made by mixing a finely divided compound of iron obtained by a special chemical process with a nearly equal volume of thin flakes of graphite. The graphite does not enter into any of the chemical actions, but assists the conductivity of the briquettes. The graphite is divided into very thin laminae by a chemical process, and these are passed through sieves or screens so as to leave a size or area of flake that is much larger than the area of the

perforation in the steel windows. The mixture is then pressed into briquettes in a mold, under a hydraulic pressure of about two tons per square inch. The briquettes have a surface area of nearly 3 inches by $\frac{1}{2}$ inch on each face.

"The negative briquettes (carbon of a primary cell) are made by similarly mixing a fine divided compound of nickel, obtained by special chemical means, with a nearly equal bulk of fine flakes of graphite, and solidifying the mixture in a mold into briquettes of the same size as above."

Referring to the action on the briquettes of the current in charging and discharging the author says:

"The action of the charging and discharging current upon the briquettes seems to be transferred from their external surfaces inwards in a manner similar to the transfer of carbon and oxygen in the process of making malleable cast-iron in the furnace on the principle of cementation. No active material has been found to be ejected from the briquettes through the window perforations, even under the deliberate overcharging and discharging. Such gas as is thereby produced makes its appearance on the external surface of the windows."

The batteries, according to Mr. Edison, can be manufactured and sold at a price per kilowatt hour not greater than the prevailing price of lead cells, which would seem to indicate that there may possibly in the near future be a boom in storage battery cars and in electric automobiles.

* * *

Electricity in Japan.

The use of electricity for lighting purposes is spreading in Japan, and it is now not uncommon to find electric lights displayed in Japanese shops and in front of and inside the dwellings of the better classes. The principal importation of apparatus and supplies is made from the United States, and they are much preferred to those manufactured for that market in Great Britain and Germany. This information has been obtained from Japanese electric light companies themselves. The total values of these imports in 1899 was \$218,100, of which the United States sent \$129,707 worth.

Two years ago the United States stood at the foot of the list in the exportation of telegraph wire to Japan, but now this country stands nearly at the head. Throughout 1899, the United States led in exports of electric light wire to the Japanese market, as in 1897. In 1898, Great Britain had a slight advantage in this respect.

The value of telephones imported into Japan fluctuates widely every year. The United States remains the chief exporter, and in 1899 sent \$51,567 worth against \$18,595 in 1898. During 1897, the American export was \$118,767. Great Britain and Belgium are competing in a small way.

The steamer Lake Champlain, which arrived in Halifax, N. S., last week was fitted with the Marconi wireless telegraph apparatus, and Prof. Stacey, a passenger, made a practical test of the Marconi system. He says that on leaving England he communicated with Marconi stations at Holyhead and Rosslare, Wexford, Ireland, from a distance of about fifty miles. Several messages were sent. On the return passage other tests will be made.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

MR. C. P. STEINMETZ of the General Electric Company has presented to the electrical engineering laboratory of Union College, Schenectady, N. Y., several hundred dollars' worth of apparatus, consisting of a one-half horse power three-phase induction motor, a three-phase rotary converter, a three-phase variable ratio transformer, besides several minor pieces of apparatus. The electrical engineering laboratory has been the recipient of several gifts of a similar nature during the year and students in this department fully appreciate their favors.

A CABLE dispatch from Buenos Ayres, S. A., states that Señor Ricaldoni, an engineer, has made experiments with an improved system of wireless telegraphy. The results of the experiment were very satisfactory. Señor Ricaldoni will soon try a submarine boat of his invention.

THE local committee has arranged the programme for the coming convention of the Canadian Electrical Association to be held at Ottawa. The dates are June 19, 20 and 21. The meetings will be held in the reading room of the Russell House. On the first day, Mayor Morris will extend a civic welcome, and the visiting delegates will be driven about the capital. Visits will also be paid to various points of interest. On the evening of June 20 the annual banquet is to be held in the Russell House. During their stay the delegates will be given a trip to Rockcliffe and the rifle range, and to Britannia-on-the-Bay, over the O. E. Railway suburban line, and to Aylmer and Queen's Park on the Hull electric line. A visit will also be paid the Metropolitan Electrical Company's works at Britannia, and the plants of the Hull Electric Company and Capital Power Company at Deschenes. Special attention is to be paid to the electric plants at and about the Chaudiere. On the list of papers to be read at the convention is one entitled "Dominion Electrical Standards," by O. Higman.

A LIEUTENANT in the Russian navy has invented an electric submarine boat which the Imperial Government regards as of excellent promise. The boat is now under construction at Cronstadt and will be ready for practical tests in another month. It is being built under the supervision of M. Kuteinkoff, a prominent naval engineer.

ACCORDING to a persistent cable rumor from Paris the French Thomson-Houston Electric Company is about to become the controlling force in a big transportation monopoly, including all the Paris omnibus and tramway lines as well as the Metropolitan Underground Railway. The Thomson-Houston Company, it is declared, has just bought 3,000 shares of the General Omnibus Company, and has also made a deal with the Metropolitan by which it obtains a large financial interest in that concern. An article in the Paris "Presse" declares that the Thomson-Houston Company has been working a long time to acquire a majority of the shares of the traction companies of Paris, in order to gain control of them, whereupon all other electric competition will be shut out. The "Presse" also says: "This cursed trust idea has come to us by way of New York and

London. It surely has not been a sufficient success in those cities to warrant us in allowing it to invade Paris." The Thomson-Houston Company is mainly engaged in furnishing material to the French electric transportation companies, often accepting as payment stock in the new companies. It is understood that in this way the Thomson-Houston people have acquired a powerful voice in Parisian traction affairs.

THE electric town of Shawinigan Falls, Quebec, which had a population of one dozen people, two years ago, is now a municipality of 4,000 people, all owing to the generation of electric energy there. The town is laid out precisely like the city of New York, bounded on two sides by a river. So far, the chief industries are the Shawinigan Water & Power Company, having at present a capacity of 25,000 hp. with capabilities of developing 100,000 hp., the Pittsburg Reduction Co., the great pulp factory being constructed by the Belgo Pulp & Paper Company, the Calcium Carbide Works, large brick works and a cotton mill about to be constructed. All these industries are the outcome of electric power development.

THE contestants in the Paris-Bordeaux and James Gordon Bennett automobile races started about 4 o'clock on the morning of May 29. There were only three competitors for the Bennett Cup, Charron, Levegh and Girardot, and eighty-nine entries for both races. The distance was 345 miles. The cup competitors used motors of from 40 to 48 hp. Fournier, the first competitor to arrive at Bordeaux, piloted a Morss motor and made the run in 8 hours 44 minutes and 44 3-5 seconds. Farman was second, in a Panhard motor, and occupied 9 hours and 14 minutes, while Vogt, who was third, in a Panhard motor, covered the distance in 9 hours 40 minutes and 11 seconds. Girardot, who arrived eighth among the contestants, won the James Gordon Bennett Cup. He covered the distance in 11 hours and 44 minutes.

ELECTRIC automobiles are manufactured in Toronto, Ont., and exported to England.

THE development of mineral regions in Arizona by electricity is the latest event of importance in the mineral fields of that section and a subject which is being generally talked about. San Francisco capital is first to undertake the ambitious scheme of supplying the machinery and camps of an extensive mineral belt in Arizona with electricity for power. Chas. M. Clark, who is at the head of the enterprise, has received a report from a San Francisco engineer favorable to the enterprise. According to the plans an electric plant will be established on the Salt River about 20 miles from Globe at the junction of Cherry Creek and the wires will be strung first to Globe and then through the Mineral Creek district reaching, after passing through the Black Warrior mines, the camps of Kelvin, Ray and Troy and a number of mining properties in that region. The engineer states in his report that the waters of the Salt River at any season are capable of moving machinery that will generate more than 3,000 hp.

A CHICAGO paper states that a new third rail electrical invention has been perfected by E. W. Farnham, industrial commissioner of the Chicago, Burlington & Quincy Railroad,

which promises to solve the problem of operating surface lines. Tests made in the presence of W. J. Murphy, vice-president of the Queen & Crescent road; B. R. Noble, president of seven Michigan banks, and other capitalists and railroad men, show the device to be a success. It is claimed the invention can be applied to cable lines, and that one power-house will be sufficient for at least 150 miles of road. The mechanical construction of the third rail is along the lines of the practical action of a soft iron shoe plate when pressed against a revolving chilled or steel car wheel. The current is introduced to the rail and thence to the motor through the shoe plates. The Third-Rail Construction Company, with a capital stock of \$3,500,000, has been incorporated to push the invention.

THE "Moniteur Scientifique" in a recent issue refers to the manufacture of glass by means of electricity. The materials in fine powder are fed into an electric furnace in several compartments; in about twenty minutes a clear liquid glass is obtained, which can be run into molds or worked as usual. For the finer kinds of glass the compartments are placed over one another, as the refining takes place more quietly. Fifty volts are sufficient with the Becker furnace, and the current can be either alternating or continuous. It is claimed as an advantage that the furnace can be easily started or stopped within a short time, and that the expense of pots will be saved. The trials are being made by a company at Cologne.

ABOUT fifty men were put to work in the Crocker-Wheeler Company's works, at Ampere, N. J., Monday morning, and all day the plant was patrolled by forty-seven armed private detectives, who kept the striking machinists from interfering with the men. The company has provided cooks, waiters, and a kitchen, and cots for the workers, and says it will board them for a year if the strike lasts that long. Plenty of reading matter has also been furnished to them and other entertainment is promised.

A CABLE dispatch states that one of Mr. Marconi's latest experiments is the adaptation of his system of wireless telegraphy to the automobile. While bowling along the country roads of Dorsetshire he sent messages from his motor carriage to Ventnor, in the Isle of Wight, thirty miles away, over the Solent and chalk cliffs, and ordered his lunch at the hotel at Poole, whither he was bound. This is a peaceful possibility of the invention. The first automobiles to which the wireless telegraphic apparatus has been attached are intended for war. Cars thus fitted, says the London "King," are to be used in the forthcoming military manoeuvres.

AN electric car has been built for General Manager George B. McCullough of the Union Traction Company of Indiana at a cost of \$12,000. The car is 60 feet long and at either end is a fender, resembling a locomotive cowcatcher. It is equipped with an electric brake. The interior contains two apartments—one known as the "red room," and is finished in mahogany and red, with a blue ceiling, and is fitted with a desk and writing table. It was designed as a combination smoking room and office. The other is the

"green room," which, besides being fitted with berths, may be used as a dining room. Adjoining this apartment is the bath, buffet and kitchen. Aside from the magnificence of the structure, it is a model of car building. It is designed to attain a speed of 50 miles an hour. The tracks of the Union Traction Company parallel those of the Big Four for many miles, and the competition forces the electric company to maintain a high rate of speed.

THE N. Y. "Tribune" says: Both in England and Germany schemes are on foot to run electric trains at a speed of almost 100 miles an hour and to charge low fares on these wonderful "flyers." When a railroad of that sort is built across New Jersey the temptation to Philadelphians to remove their business offices, their banks, corporations, mills and stores to New York may prove irresistible. They can get a peaceful night's rest in their beloved homes, and can come to the metropolis every morning to make money after they have enjoyed their favorite breakfasts of scrapple, catfish and waffles, and can return every evening in time for dinner. To sleep in Philadelphia every night in the week and to make money in New York six days out of seven—what an ideal existence!

MAYOR VAN WYCK of New York has signed the resolution of the Municipal Assembly providing for a Rapid Transit tunnel between the boroughs of Manhattan and Brooklyn.

FRANK L. WEAN, Special Master in Chancery, has filed in the United States Circuit Court, Chicago, his report on the Peoria electrolysis case. He recommends that an injunction be issued restraining the Peoria electric car lines from operating their cars by the single trolley system. The reason given by Master Wean for recommending an injunction is that the underground water mains in the city of Peoria are being destroyed under the influence of the electric current which escapes from the tracks of the trolley lines.

PRESIDENT MCKINLEY, in his speech at San Francisco May 18, on the occasion of the launching of the battleship Ohio, said: "There is nothing in the world that brings people so close together as commerce. . . . The nations are close together now. The powers of the earth are tied together. We have overcome distance. We not only want a commercial line, but we want a cable line from here to the Philippines. We want it to be an American cable that cannot be cut by any power in the world. It is said trade follows the flag. The telegraph must follow trade."

A NOVEL and most useful contrivance of an electric lamp for use especially in reading meters is the invention of Mr. Oster, of Urdingden, says the "Electrical Engineer," London. As usual in this class of lamp, the accumulator is carried in the pocket, but the lamp in question is so made as to allow of its being carried in the mouth. A squeeze with the teeth sets it in action, with the obvious advantage that both hands are left entirely free.

MR. CLINTON L. ROSSITER, late president of the Brooklyn Rapid Transit Company, says he will soon accept the presidency of a new million-dollar trust company of Brooklyn.

THE MERCURY PROCESSES FOR THE PRODUCTION OF CAUSTIC ALKALIES AND CHLORINE.

BY JOHN B. C. KERSHAW, F. I. C.,
London.

Processes for the manufacture of alkalis and chlorine by the electrolytic method may be divided into two broad classes, namely, diaphragm and non-diaphragm processes.

The greater number of processes of the latter type make use of mercury or a fused metal for separating the sodium from the electrolyte, and in the present article the writer proposes to give some details concerning the present position of the non-diaphragm mercury processes.

FIG. 1.

The Castner cell, which is one of the most successful of the cells based on this principle, has often been dealt with in the technical press, and it would probably be superfluous to give, at this late date, any detailed description of the cell. It will suffice to say that it differs from other mercury cells in the method of withdrawing the mercury when charged with sodium from the cathode compartment of the cell, and in submitting this sodium amalgam to the action of water. In the Castner cell this withdrawal is effected by a mechanical rocking movement of the cell; while in other types of mercury cell the transfer is brought about by different methods of utilizing the force of gravity.

The Castner cell is in operation at Weston Point in England, at Osternienberg in Germany, and at Niagara Falls in America.

The Weston Point Works commenced to operate with 1,000 hp. in 1898 and have now reached their full capacity of 4,000 hp. It is not intended to add to the plant at present.

FIG. 2.

The output of this works is estimated to be about 6,000 tons, 70 per cent. caustic soda, and 13,000 tons, 35 per cent. bleaching powder per annum. Recently the manufacture of metallic sodium by the Castner process has been commenced at Weston Point.

The view given of this works shows that in the early days of the manufacture no harmful effects could be observed upon the crops in the neighborhood, but it is probable that in time it will be more difficult to raise "bumper crops" of oats close to the boundaries of the works.

At Osternienberg, in Germany, the German

Solvay Company have been operating the Castner cell since 1896 with 1,500 hp.; and at Niagara the same cell has been working since 1898 by the Mathieson-Alkali Company. Until recently a 2,000 hp. plant had been operated at the latter place, but towards the end of last year a new company, the "Castner Electrolytic Alkali Company" was formed, and the works at Niagara are now being extended to utilize 6,000 hp. The whole of these extensions are expected to be completed during the current year, and the Electrolytic Alkali Works at Niagara will then be the largest works of this kind in existence.

All the Castner cell alkali companies have hitherto been financially successful, and the English company is paying its ordinary shareholders 8 per cent. upon the capital invested.

A modification of the Castner cell has been patented by Solvay & Co. of Brussels, and this improved mercury cell is now operated at Jemeppe in Belgium, and at Donetz in Russia, by sub-companies founded by the Brussels firm.

decomposed. The cell is provided further with inlet and exit pipes for the brine, the flow of which through the cell is in the same direction as the mercury, and also with an outlet (V) for the chlorine gas, generated at the anodes. A pump is required with this type of cell in order to circulate the mercury, but it is claimed that many advantages compensate for this addition to the cost of operating the cell. These advantages are:

1. The cells can be constructed of any size, since no mechanical motion is required.
2. The flow of mercury can be adapted to the current passing through the cell, and can be increased or diminished as desired.

3. The concentration of the amalgam can if requisite be allowed to proceed until a solid crust is formed, without any hindrance to the proper operation of the cell; for this solid crust passes away over the weir (Z) without difficulty.

That the Solvay Company is satisfied with this form of cell is proved by its adoption for their new works at Jemeppe and at Donetz, in

VIEW 1.—THE CASTNER-KELLNER ALKALI WORKS, ENGLAND.

The Solvay cell may be explained by aid of Figs. 1 and 2, which show the cell in sectional elevation and in sectional plan.

The principle of the cell is based upon the fact that the amalgam of sodium and mercury is lighter than the pure mercury and floats upon its surface. By making use of a cell provided at one end with a bridge or weir it is therefore possible to float off the amalgam, while retaining the heavier pure mercury on the floor of the cell.

The cell is built of any suitable material and is rectangular in form. It is closed, above, and is provided with a large number of carbon anodes (B) which hang in the concentrated salt solution used as electrolyte. An opening (O) at one end allows fresh mercury to be continually pumped into the cell, thus raising the level of the pool of mercury on the floor of the cell which forms the cathode (S W), and causing the amalgam floating on the surface to pass away over the weir (Z) to the decomposing chamber where it is treated with water and

place of the Castner cell, although they hold the European patent rights for the latter.

The works at Jemeppe and Donetz each utilize 1,500 hp. and are estimated to produce each about 6,000 tons caustic alkali and bleach per annum.

The steam-generating plant at Jemeppe is shown in View 2.

The third mercury process in actual operation is that used by the various works now under the control of the "Elektron" Company of Griesheim, near Frankfort, the pioneer company in these new developments of the alkali industry.

At one time it was stated that the process worked out in 1888-1890 by this firm, was a diaphragm process, but according to later information the process now worked is of the non-diaphragm mercury type, and probably it only differs in minor details of cell construction from the Castner and Solvay processes. As the "Elektron" Company refuses to give any information concerning the process used,

and as no patents have been taken out by this company, nothing definite can be said upon this point. Since the amalgamation of the Griesheim & Bitterfeld interests in 1899, the factories at the following places have passed under the control of the Griesheim Company: Rheinfelden, Bitterfeld, Bozel, Lamotte, Monthey, Zombkowitz, Slaviansk, and Flix in Spain. The total power available in these electrochemical factories is about, 19,000 hp. but it is unlikely that the whole of this is yet being

VIEW 2.—THE SOLVAY ALKALI WORKS, JEMEPPE, BELGIUM.

utilized for the production of caustic soda and bleach.

In addition to the places named above, the "Elektron" process is also being operated at Ludwigshafen and at West-Eregeln in Germany, by independent companies.

Limit of space forbids any detailed account of the Rhodin process, large works for the operation of which are now being built at Sault Ste. Marie in America, or of the interesting forms of mercury cell devised by Crudo & Bissizza, by Kynaston, and by Franke. The three last are still in the experimental stages of their development. At some future date the writer may present details of these, and of the Rhodin mercury cell, to readers of *ELECTRICITY*.

NOTES ON THE USE OF THE DIFFERENTIAL GALVANOMETER.*

BY C. W. S. CRAWLEY.

I do not wish to suggest that I am bringing forward anything new, but rather to say a few words in favor of an old but very effective instrument which has fallen into disuse, and to show a practical way of using it for modern work. In early days the differential galvanometer was used a great deal; when the bridge came into general use it was shelved, as the scope of the bridge was so much greater, and it sufficed for all the resistance measurements then required. Another reason why the differential galvanometer went out was, I think, this: People were used to the old pattern of differential galvanometer with pivoted needle, which was adjusted once for all and remained right. Then the reflecting galvanometer became universal, and the reflecting differential galvanometer when adjusted does not remain right for good, but must be very carefully leveled, and even then is seldom in perfect adjustment. Some year or two ago I wanted some low resistances adjusted which it was impossible to bridge, and so I looked into the potentiometer, which was better, but very troublesome, and this brought me to the differential galvanometer. For I always look on the differential galvanometer as a po-

tentiometer; only, instead of balancing opposing EMF.'s one balances the EMF.'s caused by them.

Now, I know by sad experience that to add just a differential galvanometer was a very great nuisance, so I took the bull by the horns and did not adjust at all, but simply had the galvanometer coils wound double—i.e., with twin wire, and set the instrument up as it was, without adjustment.

In Fig. 1, *a* and *b*, 100 ohms each, are the circuits of the differential galvanometer in parallel, opposed, joined to the battery. In the circuit of *a* is an 0.1 ohm resistance, which can be cut out by a key, and also a slide-wire resistance, *S*, of about 1.5 ohms. In circuit with *b* is

FIG. 1.

FIG. 2.

FIG. 3.

FIG. 4.

enough resistance to about balance. This can be a resistance box. When joined, as shown, if *a* or *b* predominates and gives a deflection, sufficient resistance is added or subtracted by the slide-wire till the spot roughly comes to zero. Now depress the 0.1 key; this disturbs the balance by 0.1 per cent. and causes a deflection of some hundreds of scale divisions. If we do not want to read closer than 0.01 we need not adjust the balance closer than, say, 10 scale divisions.

We now know that two equal and opposite EMF.'s at the terminals of the two-coil circuits will balance, so that we can compare any two equal coils with great ease and great accuracy. For example, two 0.001 ohm coils, as in Fig. 2.

and allowing for it, or setting to an odd ratio; but this is more troublesome.

Now, as to sensitiveness. With 0.1 volt at the terminals of coils short on to the galvanometer and a 10 second swing, we have a deflection of 450 scale divisions for a difference of 0.1 per cent., so that we can compare two 10^{-6} ohm resistances with only 10 amperes, and have a deflection of 4.5 scale divisions for 0.01 per cent.

As to limits of accuracy and sources of error, the galvanometer can be balanced far beyond anything required. Next the question of perfect contacts; they can certainly be counted on not to be more than one one-thousandth ohm if made rationally, or an error of 0.001

FIG. 5.

FIG. 6.

If they are not alike there is a deflection. Pressing the 0.1 ohm key gives the deflection for 0.1 per cent. difference between them, which, with only 10 amperes through them, is about 400 scale divisions, so when working to 0.01 per cent. anything under, say, 10 scale divisions can be ignored (which is a great comfort when adjusting).

But we can go a great deal farther; we can join up on to the terminals of a 1 ohm and a 10 ohm standard coil, as in Fig. 3, and add resistance to *b* circuit till a balance is obtained. For all-round work an ordinary resistance-box will do, but if there is much 10 to 1 work to be done it is sometimes worth having a separate coil of

per cent. As to temperature, the galvanometer coils are copper, but being wound double remain always at the same temperature. Thermal contacts may occur at times, but are easily detected and eliminated by reversing the battery current. They are infrequent and small in effect.

For long and continuous testing, especially with a ratio, I like to have a rocking mercury switch which will do the check instantly. When working with ratios, temperature may cause an error; but if the galvanometer is placed so that its temperature remains constant, as shown by a thermometer, the error will not exceed 0.02 per cent. A check should

*Paper read before the Institution of Electrical Engineers, London, April 18, 1901.

be made at the end of the test. In setting it is, of course, necessary to allow for errors in the standards, if they would be within the limits required. It is easily done by deflection. There is only one inherent error to allow for. That is due to the resistance of the coil circuits of the galvanometer not being exactly the same when they are in balance. This, however, is but small. If the coils differ by a per cent. and they are b times the resistance of the coils under test, the error in the result is a/b per cent. a should be under 1, and b is generally at least 100, so that at worst the error is 0.01 per cent., even when comparing 1 ohm coils or setting 1 to 10 ratio with 1 ohm to 10 ohm coils.*

I designed a potentiometer some time ago to get rid of a slide-wire, and it is used a good deal now. There are two dials, one of about 16 ohms, divided into 150 equal parts, and the other, the whole of which is equal to one coil of the first dial, and divided into 100 parts, thus giving the equivalent of a slide-wire divided accurately into 15,000 parts, which is ample for practical work, and which cannot be damaged by its natural enemies—wear, pupils or students. It can also be speedily checked, right through, against itself. Now, just think of the labor of adjusting the 150 contacts of about 0.1 each, and still worse, the 100 contacts of about 0.001 each by potentiometer or other such means. But by differential galvanometer it is perfectly simple; and the result can be easily checked, as pointed out before, by setting the galvanometer 2 or 3 or 10 to 1 instead of level.

Another use of the differential galvanometer method is shown diagrammatically in Fig. 6. It is a workshop method of measuring anything between 0.1 and 0.01, or even less. In the diagram there is a slide-wire of 0.1 total in series with the resistance under test and a battery. One coil of a differential galvanometer is applied to the ends of the resistance R by means of stabbers on cords; the other coil is joined to one end of the slide-wire and to the sliding contact, so that it takes the fall over more or less of the wire, the whole length of the wire being divided into 1,000 parts by a scale; each division (about 1 mm.) is equal to 0.0001 ohm. The wire is about 0.1 inch diameter, so wear does not come in. It works well with 5 A.

In conclusion, I do not suggest the differential galvanometer for ordinary accurate coil work; the Carey-Foster method is perfect for that, and I have never sanctioned any accurate coils between 1 and 10,000 being finally tested by any other method. But below 1 ohm it is invaluable, and it makes quite easy a good

*Let the two coil circuits be so adjusted by resistance that in parallel they give no deflection. Then equal EMF.'s, at their terminals, always give none. Now join to the terminals of two equal coils, D , in series (Fig. 5). If the galvanometer circuits are of equal resistance there will be no deflection. But if they are not, but are a and $a+b$ respectively, the EMF.'s on them will be proportional to the joint resistances, and there will be a deflection due to the difference of EMF. on the two. The joint resistances are:

$$R_1 = ad/(a+d) \text{ and } R_2 = (a+b)d/(a+b+d).$$

Let $b = a/p$ and $d = a/q$; substitute, and we get $R_1/R_2 = 1 + 1/(p+q+pq)$; p and q are large—at least 100; so that error is practically $1/pq$, i.e., if the coil circuits differ by C per cent. the error in the result is C/P per cent., which is of the order of 0.01 at most, and can be easily allowed for in setting.

deal of special work which would not be practical commercially by any other method. For example, the conductivity of two copper bars can be compared with quite reasonable currents, say 10 amperes for bars 1 inch square, which gives about four scale divisions for 0.1 per cent. with contact points 12 inches apart.

THE MODERN SEARCHLIGHT IN THE NAVY.

BY FRANK C. PERKINS.

The searchlight on the man-of-war has come to be considered one of the most important of the ship's equipment and since the use of electricity has become so general special attention has been paid to this class of apparatus.

There has been considerable discussion as to the desirability of using the searchlight for revealing an approaching enemy on account of at the same time making a better mark of

FIG. 1.

Electric Searchlight and Case for use on Ship's Mast.

the ship itself. It is generally conceded, however, that in case of a fleet attacked by a number of torpedo boats, the proper action is to turn all searchlights on, and repel the attack by a liberal use of shot and shell.

It is much easier for the torpedo boat to distinguish the outlines of a large gun-boat than it is to locate these small craft by means of the searchlight sufficiently to insure a good marksman a sure hit. The modern searchlights are located at various points on the battleship, at the fighting tops as well as on the decks.

The illustration, Fig. 1, shows a hand feed operated electric searchlight and cage built by J. H. Holmes & Co., of Newcastle-on-Tyne, England, for use on a ship's mast.

In order to get the best results from the aiming and firing standpoint of the gunner it is necessary to place the searchlight as far away from the gunner as possible and, preferable as far above the deck guns as possible, and while this really aids the enemy to a certain extent, by revealing it to the enemy's torpedoes

and guns, it gives the gunners on the deck below a better opportunity for good work.

The position of searchlights on a battleship is of great importance, and each one is located according to the class of work it is to perform. Those on the lower decks near the water line while of great value in destroying the vision of the occupants of the attacking boats do not greatly aid the gunners, who find it almost impossible to fire accurately and note a target definitely through a strong beam of light. It is claimed to be far easier to operate the guns from points below the light while very difficult to fire from above the searchlights.

Operators working the projectors find it very difficult to see the object sought, on account of being so near the beam of light that his line of vision enters ahead of the advancing boat.

It is of great interest to note the methods of operating searchlights from a distance by electrical control entirely. This allows the operator to remain a considerable distance from the light, thus being better able to make the necessary observations and direct the course of the beam of light to better advantage. The first requisite of such a searchlight is to have an automatic feeding focusing arc light mechanism. Such automatic lamps are shown in illustrations, Figs. 2 and 3, the former showing the vertical carbons with the connections to the feeding mechanisms, while the latter shows the G. E. 90° automatic lamp for searchlights. In order to properly control the searchlight electric motors are used, one to turn and one to elevate the projector barrel, with focusing lamps and reflector. Such a mechanism is shown in the accompanying drawing, Fig. 4, of a Siemens searchlight operated by a switch, which controls both motors by turning to the right or left or up and down exactly as if moving the searchlight by the handle. The light can be stopped at any desired position and the current to the arc lamp is controlled from the same point.

On ship board, the two kinds of searchlights required, are, first, the one for intense illumination of an object in the far distance, and second, one for illuminating a wide belt at a moderate distance. For the first purpose the lights should be placed high up; for the latter, when it is a question of detecting and following up torpedoes, near the water line. In many cases it is not convenient to have long and short range projectors. Schuckert & Co., of Nürnberg Germany, have provided their searchlights with double dispensers, two systems of cylindrical lenses, whose distance apart can be adjusted, and the light thus concentrated in a parallel beam or dispersed to form a cone of 45 degrees.

The diameter of the mirror varies from 450 mm. to 1,500 mm. while the positive and negative carbons of the focusing lamps range from 15.25 mm. to 38 mm. The current used is usually from 25 amperes to 60 amperes, but in some cases, in the largest searchlights, reaches 150 amperes. The searchlights weigh from 180 to 1,350 kilograms without electric motors, while the Schuckert projectors with motors range in weight from 250 to 1,400 kilograms. The searchlight built by Schuckert, shown in Fig. 5, has a mirror 60 centimeters in diameter.

The two terminals are fixed to the stationary base, B. From the binding screws, cables lead to the copper spring brushes, insulated upon the top plate of the base, and bearing against two concentric contact rings attached

to the bottom of the revolving base, C. The binding screws, D, connected with these rings, and elastic cables take the current to the terminals of the focusing lamp. In the projector case, which is a well ventilated drum of sheet-iron, the lamp is supported by two longitudinal bars parallel to the axis of the case. The lamp can be moved backward or forward by means of the hand wheel, 5. The whole projector turns in its cradle which revolves with the base, C. This movement of the case about its horizontal axis, raises and lowers the beam of light, while the revolution of the whole projector, apart from its stationary base about its vertical axis, is effected in a similar manner. The movement of the case on the horizontal axis may be made by hand wheel, 3, through

parallel beam is produced. When the arc is not in the focus a light cone of an angle of 10 degrees can be obtained. The exact centering of the carbons is a matter of great importance,

FIG. 3.
G. E. 90° Automatic Searchlight Lamp.

therefore dark colored glass windows have been provided on both sides of the shell, to see whether the carbons are in the same horizontal plane. For adjustment and focusing, a little mirror, T, has been placed in the top of the drum near, A, the mirror throwing an image of the arc on the lateral window, W. The window is made of ground glass, and a wire is stretched behind it; when the image of

FIG. 2.
G. E. Searchlight Automatic Lamp.

worm gear 2 or by means of the electric motor, HM. The movement of the projector on its vertical axis may also be obtained by use of a hand wheel or by means of the electric motor VM, hidden from view. The parabolic glass mirror is backed with silver, embedded in asbestos and mounted in a collar, in which it is fixed by means of a large number of brass straps bent at an angle. The collar is bolted to a ring forming the back of the drum. The position of the carbons is shown to be horizontal. Lest the ascending hot-air current should lead to an oblique burning of the carbons and an unsteady light, an arc of soft iron, 4, almost encircling the positive carbon, has been placed near the arc. The current flowing through the carbon converts this iron into an electromagnet, which attracts the arc, so that the crater forms in the longitudinal axis and not obliquely. The lamp is made to slide in its longitudinal axis backward and forward by means of the hand wheel, 5, and when the arc is in the focus of the mirror an almost

FIG. 4.
Electrically Operated Siemens Searchlight by Motor Control.

the crater touches the wire the arc is in focus. In front the case is either closed by an ordinary pane or by a dispersion lens. When the

latter is used the arc must always be in focus. The dispersion lens spreads the beam in the horizontal plane—the lamp itself and therefore the beam may be inclined of course—in order to illuminate the whole length of a torpedo-boat or other object close to the ship.

The searchlights are used a great deal at the present time for signaling at long distances, and are particularly well adapted to this class of work, although it can only be accomplished at night, while the latest scheme of the Marconi wireless telegraphy is operative at night or day and at much greater distances. One method of searchlight signaling is to use a round disk suspended on a spindle extending through the projector barrel between the

FIG. 5.
Schuckert & Co. Searchlight in Austrian Navy, Operated by Electric Motors.

lamp and the mirror and vibrating this by means of a small lever handle on the spindle. In other projectors flashing screens are used in front of the searchlight, vertical strips being used and working similar to a venetian blind, the movement of a lever opening or closing all of the slats and thus making the various signals.

Land Cables for Alaska.

THE Signal Corps is making arrangements to send to Alaska about 100 miles of land cable, which can be used in the water or on the land where it is impossible to make use of regular land wires. It has been found that cables are necessary over the tundra. In the winter time poles can be set in the tundra, but as soon as summer comes they fall down. The tundra is considered impassable, and wherever telegraph lines cross it cables will be used.

"Electricity's" Educational Series.

BY R. MAX EATON.

ARTICLE NO. 30.

(Concluded.)

Points for Review.

The following covers some of the points of the series, and it is suggested for the student, as a rehearsal, to write short essays on the points mentioned and to work out the problems given. The student should refer to the article covering any point for reference or aid, and in this way a general review of the series will be obtained which will refreshen the memory:

- 1—Into what four classes are the means for producing electrical action divided?
- 2—Which class applies to the means most generally used?
- 3—What is meant by the two terms electromagnet and permanent magnet? Refer to Article 1.
- 4—What are the laws governing induction?
- 5—Write a short essay on lines of force. Refer to Article 2.
- 6—What is known as Ohm's Law?
- 7—Find the voltage required to force four amperes of current over a resistance of 25 ohms.
- 8—How much current will flow over a circuit of 100 ohms if forced by 5 volts. Refer to Article 3.
- 9—What causes polarization in primary batteries?
- 10—Explain some of the methods used for depolarization. Refer to Article 4.
- 11—Write a series of instructions on the care of storage batteries.
- 12—What advantage is derived by placing glass covers over storage cells? Refer to Article 5.
- 13—Explain the principle of an ammeter. Refer to Article 7.
- 14—An induced current is always alternating. Why?
- 15—Explain the principle of a spark coil. Upon what law depends its action? Refer to Article 8.
- 16—What is one ampere turn? How do you find the ampere turns in a coil? Refer to Article 9.
- 17—To what effect in dynamos does the term hysteresis apply?
- 18—Induced currents are always alternating. Then the currents induced in the coils of an armature must be alternating. This being the case how do we get direct current over a circuit connected to the brushes? Refer to Article 10.
- 19—Why does reversing the current on the brushes of a motor reverse the direction of rotation?
- 20—Write an essay on the care of motors. Refer to Article 11.
- 21—Explain the three-wire system. What advantages are derived from it over two-wire systems? Refer to Article 13.
- 22—Write an essay on self-induction and its effects on alternating currents. Refer to Article 14.
- 23—Practically no alternating current flows

through the primary of a transformer when the secondary is not closed. Why? Why is the amount of flow in the primary governed by the amount of current being used from the secondary? Refer to Article 15.

24—Write an essay on the care of dynamos. Refer to Article 18.

25—Explain the principle of the telephone. Refer to Article 20.

26—What are the advantages of common battery systems over general or local systems?

27—Draw the Bell common battery circuit. Refer to Article 23.

28—Draw a test circuit where a voltmeter is used for testing. Refer to Article 24.

29—What causes electrolysis? Refer to Article 27.

30—What advantage is secured by placing a condenser across the contact of a vibrator? Refer to Article 29.

The Fate of Count Von Zeppelin's Balloon.

In the art of aerial navigation two distinct principles are recognized. One is based upon the idea entertained by Montgolfier. It consists in constructing a balloon that will rise and remain suspended in the air by the aid of the ascensional force developed by a gas imprisoned in the folds of its envelope. The other and more modern principle adopted by the aeronaut is that which seeks for its practical realization in the application of a dynamical motive force to a flying machine. The partisans of this system completely reject all use of gaseous bodies, whether in the form of hot air, common coal gas or pure hydrogen. They, on the contrary, rely altogether upon the scientific investigations which have been carried out respecting the physiological mechanism of the flight of birds, and upon the laws governing somewhat complicated mechanical movements. Professor Marey greatly contributed to elucidate the whole question by the ingenious methods of analysis he adopted in treating of the movements of flight. The new and more accurate calculations of Lillienthal and Loessl demonstrated the gross inaccuracy of the formula established by older mathematicians, and thus paved the way for the more modern inventors and designers of flying machines. Hiram Maxim, in the year 1894, and subsequently Langley, Hargrave, and recently Kretz, have all experimented with aeroplanes and flying machines.

The most serious and practical attempt made with a balloon, capable, or at least supposed capable, of being steered or directed, was that undertaken by Count von Zeppelin last year. Unfortunately, the experiments were inconclusive. The latest advices from Switzerland give an account of the disastrous condition to which this now famous balloon has been reduced. It appears that the violent storms which in January last swept over the central regions of Europe nearly demolished its resting place. The tempestuous gales blew in the windows of the timber shelter, furiously attacked the outer envelope of the aerostat, and ripped it open for about a third of its total length. The inner envelope, constructed of aluminum, fared no better. It was twisted out of all shape, and a large part of it literally torn away. Many of the cross pieces and uprights, also of aluminum, were bent, distorted, and in some cases actually broken. It is satisfactory to be informed that, in spite of these discouraging circumstances, the enterprising aeronaut intends to recommence his ascen-

sions in the coming summer. He has ordered two Daimler motors of a more powerful and lighter type than formerly, and it is to be hoped that some out of the dozen experiments contemplated may be attended with a decisive result of some kind.—"Engineer," London.

PROGRESS OF ELECTRICITY IN INDIA.

With the opening year of the twentieth century the Indian Section of the Institution of Electrical Engineers has been inaugurated, and, appropriately enough, at the first meeting of the section in Calcutta, Mr. F. G. Maclean, Director-General of Telegraphs, gave an interesting review of the progress of electricity in India during the past 50 years. At the beginning he called attention to the fact that until the last few years electrical work in India had been practically confined to the telegraph, which had also been the pioneer of electrical engineering in other countries. Just 50 years ago it was that Dr. (afterwards Sir) Wm. O'Shaughnessy first carried to a practical conclusion his idea of an electrical telegraph in India, but to those acquainted with the conditions of the country it would be no matter of surprise that the record of progress, excepting as related to telegraphs, could scarcely be favorably compared with that of many other countries. It was in 1851 that the first practical telegraph line was built from Calcutta to Diamond Harbor, and in the following year it was extended to Kedgeri, making in all a total length of 82 miles. This line was made of iron rod $\frac{1}{2}$ inch diameter, and on the overhead sections it was supported on bamboos, 200 to the mile. The great feature about this line was its remarkable strength, the bamboos bending to the storm, and thus preserving the line intact. Dr. O'Shaughnessy always adopted the plan of taking the line underground before entering an office in order to protect it from lightning effects.

The problem of crossing rivers was one of the first that pressed for solution in India, and in May, 1851, Dr. O'Shaughnessy succeeded in signaling across a river over 5,000 feet in breadth without any conductor. This system, however, could not be maintained, although it remained a remarkable achievement in wireless telegraphy. Nothing practical was done till gutta-percha-covered wire was imported from England, and then, after many trials, the system adopted was to secure this insulated wire in the angles of a strong chain cable. The success of the first pioneer line along the River Hughli decided the authorities in 1853 to commence the construction of a network of telegraph lines all over India, and at the present time the Department possesses 52,909 miles of line and 170,766 miles of wires, in addition to 283 miles of cable. Since 1853 the course of improvement had been the substitution of iron for wooden supports, the improvement in pattern of insulators, the gradual reduction in the weight of the wire used, and, finally, the use of copper instead of iron wires on main lines.

In 1857 Morse instruments superseded the small horizontal galvanoscopes previously in use; in 1858 there were 10,000 miles of line in operation or under construction, in the same year the first cable between India and Ceylon, a distance of 25 miles, was laid; through communication with Burmah was first established in 1865; the next year saw through communi-

cation with England by the Turkish route, while the route via Persia was opened in January, 1870, and via Suez and Aden in March the same year; duplex telegraphy was introduced in 1874, and in 1885 the quadruplex system was first used in India.

Referring to the Marconi system of wireless telegraphy, the author expressed wonder at the Department not taking advantage of it, especially having regard to the practical success of the system in connection with marine communication. Turning to other applications of electricity, the first record of an electric light installation in India was to light a goods shed in the Howrah Station yard in 1879. Various isolated installations sprang up from time to time in different parts of the country, but the first application of modern electrical engineering on any large scale was the electric tramway in Madras, in 1894, on the underground conduit system. A change was afterwards made to the overhead trolley system on account of the tropical rains, which at times flooded the conduit. The next application of importance was the Darjeeling electric lighting installation, which was the pioneer of high-tension transmission in that country, and in the last year of the century the Calcutta Electric Supply Corporation commenced operations. The latest development would be a system of electric tramways in Calcutta. In conclusion, the author thought there were unmistakable signs that India was now thoroughly awake to the great advantages of electrical power, and that efforts would be made to employ the enormous natural forces which lay at their disposal, such as water power. The most important scheme which was at present proposed was for the transmission of power from the Cauvery Falls to the Kolar gold-fields, a record distance of 100 miles.—From the "Electrical Engineer," London.

PARIS LETTER.

Special Correspondence of *ELECTRICITY*.

New Electric Arc Phenomenon.

At a meeting of the Paris Academy of Sciences, held April 22, M. Marey presented to the Society a communication from M. Koenig, entitled "Periodical Oscillations Produced by the Superposition of an Alternating Current Upon a Continuous Current in an Electric Arc." M. Koenig recalled to mind from the first that an electric arc between carbons produced by a continuous current could be considered as a telephone. As soon as arc lamp wires are exposed to the phenomenon of induction from neighboring conductors the arc undergoes modifications of such a nature as to produce a sound which is more or less accentuated; by further perfection of the apparatus, one can reach a point where the clear reproduction of speech may be made. During repetitions of his experiments the author has made researches on the influence of the superposition of sinusoidal currents upon continuous currents and the effects of such a superposition upon the light produced by the arc. For this purpose a closed circuit transformer (of 3 kilowatts) was placed in a 240 volt distributing circuit of 40 alternations—the primary winding at 308 turns and the secondary 85, divided into 5 sections at 17 turns each. By such a construction he was able to obtain tensions of 13, 26, 39, 52 and 65 volts. By placing in a continuous current circuit of 120 volts a metallic resistance, an arc lamp provided with a hand regulator

and one of the sections of the 17 turn secondary winding of the transformer, M. Koenig observed that immediately after the superposition of an alternating current that the light, which up to that time had remained stable, showed oscillations of a periodical luminous nature which followed each other slowly enough to be perceived by the eye, and that when the arc was lengthened he heard a feeble sound which corresponded to the 40 oscillations per second; the period of the light oscillations was about one twentieth of a second (estimated by the stroboscopic method). By increasing the intensity of this periodical current the luminous oscillations became stronger without change of frequency.

Extraction of a Nail from the Bronchial Tube by Means of an Electromagnet.

The above difficult and extraordinary operation has just been performed by Dr. Garel, of Lyons, France. A two year old child living at Buenos Ayres, South America, while at play had swallowed a very large nail, six centimeters long. After a short time the child came nearly suffocating, but finally by the next day all respiratory trouble had disappeared and it was supposed that the nail had passed through the digestive track, but while on a visit to France the child commenced to cough desperately and it was thought to be afflicted with chronic bronchitis, and trouble in breathing was found to come from the right side. After having heard the history of the child, Dr. Garvel thought the nail might be in the bronchial tubes. He made a radiographic examination of the child and it was found that the nail had lodged in the right bronchial tube. There was no hesitation in selecting a method to extract it. Tracheotomy was resorted to under an anesthetic and then an electromagnet was inserted through the opening and pushed down into the trachea as far as possible. The nail was immediately drawn from the bottom of the bronchial tube and became attached to the magnet. The electromagnet used was capable of supporting a weight of six kilograms and it was energized from two accumulators of four volts. Several days afterward a Bordeaux physician learned of this curious operation and performed a similar one on a three year old child, who was supposed to have swallowed a nail. By following the same methods he succeeded in drawing out the nail, which had become fixed in the left bronchial tube for a year.

MAGNALIUM.

On several occasions we have remarked the difficulty of obtaining any precise information about the properties of this comparatively new alloy of aluminum, says the London "Engineer." An article on the subject, however, has recently been printed in one of the German technical papers, from which we are able to extract the following particulars: Under the generic name of "magnalium," alloys are now prepared containing between 10 and 25 parts of magnesium per 100 of aluminum. With 10 parts of magnesium the material is said to have the mechanical properties of rolled zinc; with 15 parts to resemble cast brass; and with 20 or 25 parts of magnesium to imitate hard drawn brass and the various grades of red bronze. Dr. Mach, the inventor, finds that sodium, carbon and nitrogen in the original aluminum cause the alloys to be of no value; and this probably explains why the earlier attempts made by Wöhler to produce a useful

alloy of these two metals were quite unsuccessful. Additions of tungsten, nickel and copper, are not harmful to magnalium, except in so far as they increase the specific gravity of the alloy. Ten to 15 per cent. of antimony has the advantage of raising the melting point from 700° Cent. to a white heat. When less than 10 per cent. of magnesium is mixed with the aluminum, the alloy rolls well and is specially suitable for manufacturing sheet and tube. Large quantities of magnesium adapt it better for casting purposes.

The mechanical properties of magnalium have been investigated by Herr Kaempfer. The alloy turns well, yielding long coherent shavings; it can be drilled and milled readily, and does not slip or bind. Under the file it resembles soft brass; it does not clog, and the finest cut files can be used. It takes a high silver-white permanent polish; and it can be easily blackened. Its hardness is greater than that of pure aluminum, for it cannot be cut with a knife, so that cockplugs, spindles, gear-wheels and keys can be constructed of it. It shows a fine-grained fracture something like steel, instead of the coarse zinc-like appearance of aluminum. Its specific gravity is 2.52×0.03 . The tensile strength of magnalium ranges between 20 and 24 kilos. per square mm.—12.7 to 15.2 tons per square inch—whereas that of aluminum is only 7 kilos. per square mm.—4.5 tons per square inch. This is Kaempfer's figure for ordinary aluminum; we should prefer to quote 7 tons for cast metal, and 10 to 14 for sheet or bars. Magnalium can be easily coated with gold or nickel—electrolytically—and it can be soldered satisfactorily. The alloy is stated to resist the atmosphere well, not to "rust," and bear exposure to ammonia and sulphurous acid. It has been taken up by Voigtländer und Sohn, the opticians of Brunswick, while Siemens and Halske, of Berlin, are reported to be using it in armatures and motor car construction. At present its cost is high, as the price of magnesium is still 18 marks per kilo, but hopes are entertained that a larger market for magnalium may reduce the price of that metal considerably.

CANADIAN NOTES.

(From our Ottawa Correspondent.)

The Ottawa Electric Street Railway Company has asked the city council to pass a by-law providing for the punishment of spitting on the floors of the cars.

Mr. A. J. Macdonald, of Montreal, has just been appointed general superintendent of the street railway system of the city of Mexico. The Mexican company proposes to convert its dual system into an entirely electric road.

Montreal capitalists, who control the Gatineau and Pontiac railways and the new Inter-provincial bridge connecting the cities of Ottawa and Hull, are negotiating for the purchase of the Hull & Aylmer Electric Railway, which will enter Ottawa over the new bridge when the Montreal people get control. It is said that the price asked for the electric road is \$1,000,000.

Proposals Invited.

The Treasury Department is inviting sealed proposals until June 18, for installing an electric light and power plant in the United States Custom House at New Orleans, La., including engines, generators and switchboard. At the same time and place bids will also be

received for installing an electric light wiring system in the same building. Specifications and plans can be obtained upon application to the Department at Washington or of the custodian of the building.

Sealed proposals are being invited until June 20, for installing an additional 50 kw. engine and dynamo in the United States Court House and Post-Office Building at Kansas City, Mo. Plans and specifications can be obtained upon application to the Secretary of the Treasury, Washington, D. C., or of the custodian of the building.

Annual Meeting and Dinner of the New York Electrical Society.

The twentieth annual meeting of the New York Electrical Society for the election of officers will be held at the Café Boulevard, Second avenue and 10th street, Thursday, June 6, at 9 P.M., to be preceded at 6:45 P.M. by an informal banquet—tickets one dollar, without wine. The meeting and dinner will be followed by an entertainment in the place of speeches. Secretary Guy says that an excellent menu has been specially provided, and it is hoped that every member will make an effort to attend, to participate in this pleasant close to a very successful season.

With the object of studying the convenience of many of the members who are unusually busy at this season of the year, the Executive Committee requests that members go straight from their offices to the Café Boulevard and that no evening dress be worn.

Exports of Electrical Material from New York.

The following are the exports of electrical material, from the port of New York, for the week ended May 29:

Antwerp, 41 cases, \$2,412; Argentine Republic, 220 packages, \$5,732; Australia, 15 packages, \$8,750; Azores, 16 packages, \$145; Batoum, 2 cases, \$1,300; Berlin, 12 packages, \$220; Berne, 4 packages, \$2,800; Bilbao, 314 packages, \$39,913; Brazil, 178 cases, \$3,836; 36 packages, \$2,521; British East Indies, 32 packages, \$3,625; British Possessions in Africa, 269 packages, \$40,900; British West Indies, 7 packages, \$49; Charikar, 1 case, \$300; Chili, 6 cases, \$176; Cuba, 104 cases, \$2,978; Genoa, 45 packages, \$2,183; Glasgow, 2 packages, \$107; 2 reels cable, \$95; 54 cases, \$440; Hamburg, 66 packages, \$2,133; Havre, 27 packages, \$2,737; Hayti, 3 packages, \$106; Hull, 5 cases, \$716; Ipswich, 1 case, \$121; Liverpool, 163 packages, \$32,629; London, 712 packages, \$103,037; Manchester, 10 packages, \$1,632; Mexico, 371 packages, \$2,200; Milan, 79 cases, \$4,235; Naples, 57 cases, \$854; Oporto, 1 package, \$169; Peru, 32 packages, \$1,449; Rotterdam, 16 packages, \$162; Santo Domingo, 30 packages, \$635; Santander, 23 packages, \$340; Southampton, 3 cases, \$597; St. Petersburg, 24 cases, \$450; U. S. Colombia, 18 cases, \$293; Venezuela, 35 cases, \$1,075; Vienna, 1 package, \$50; 2 cases, \$1,982.

PERSONAL MENTION.

Mr. Charles T. Yerkes, the street railway magnate, is talking of buying a country residence in England, where he may reside permanently.

Mr. Charles W. Reynolds of Spokane, Wash., has been appointed district manager of the Pacific States Telephone & Telegraph Company, with headquarters at Spokane, to succeed G. B. Bush.

INCORPORATIONS.

The East Jordan Electric Light & Power Company, East Jordan, Mich. Capital stock, \$10,000.

The Atlantic Light & Water Company, Norfolk, Va.—to construct electric and gas lighting plants. Capital stock, \$500,000. T. R. Heller is president.

The Federal Development Company, Newark, N. J.—to develop all sorts of enterprises, including telephones, telegraphs and water rights. Capital stock, \$200,000.

The Gas & Electric Company of Corning, Albany, N. Y. Capital stock, \$375,000. Directors: Ashley T. Cole, New York City; L. B. Grant and H. L. Merry, Brooklyn.

The Weston Electric Power Company, Denver, Col.—to operate in Lake County. Capital stock, \$50,000. Incorporators: W. P. Garrison, E. R. Reed and J. W. Sanborn.

The Conestogo Electric Light & Power Company of Carroll County, Westminster, Md. Capital stock, \$100,000. Incorporators: E. C. Folger, D. S. Collett, H. Jarvis and others.

The Illinois X-Ray and Electro-Therapeutic Laboratory, Chicago, Ill.—to develop and give instruction in the uses of electricity. Capital stock, \$25,000. Incorporators: J. E. Gilman and others.

The Syracuse Lighting Company, Syracuse, N. Y.—to manufacture gas and electricity. Capital stock, \$2,500,000. Directors: Charles V. Nellany, Brooklyn; Harry F. Cues, Staten Island, and Richard F. McKiniry, New York City.

The Upper Hudson Electric Company, Albany, N. Y.—to furnish gas and electricity in towns and villages in Greene County. Capital stock, \$100,000. Directors: William O. Turner, New York City; Eugene Wolfe, Athens, and N. W. Dalton, Bath.

The Northwestern Wireless Telephone & Telegraph Company, Chicago, Ill.—to operate in Illinois, Wisconsin, Iowa, Minnesota, in the northern part of Michigan and in Arizona. Capital stock, \$5,000,000. Joseph S. Schwab is chief stockholder.

The Butte Electric Light & Power Company, Trenton, N. J.—to do everything connected with the manufacture and supply of electricity. Capital stock, \$2,500,000. Incorporators: William J. Denning, William H. Mansfield, Charles E. Estabrook, C. R. Dean, Thomas K. Henderson, C. L. Reed, I. F. Keeler, J. S. Anthony and William F. Bayton, all of Jersey City.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED MAY 28, 1901.

ELECTRIC RAILWAYS AND APPLIANCES.

675,027. Controller for Electric Cars. Walter W. Tice, Rahway, N. J., assignor of one-half to George H. Tice, Perth Amboy, N. J. Filed Aug. 1, 1900.

675,038. Electric Railway. Philip Farnsworth, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed May 31, 1901.

675,050. Electric Railway. Samuel B. Stewart, Jr., Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Feb. 21, 1901.

675,086. Electric Railway-Signal. William H. Council, Williamsville, Ill., assignor to the Miller Signal Company, Chicago, Ill. Filed April 19, 1900.

675,142. Trolley-Wheel. Herbert W. Smith, Medford, Mass., assignor of one-half to Arthur W. Field, Boston, Mass. Filed March 6, 1901.

ELECTRIC LIGHTS AND APPLIANCES.

675,033. Electric-Arc Lamp. Curt A. M. Borner, Berlin, Germany. Filed July 24, 1900.

ELECTRICAL MACHINERY AND APPARATUS.

674,890. Static Machine. Henry E. Waite and Harry F. Waite, New York City. Filed April 10, 1901.

674,981. Controlling Electric Motors. Eugene C. Parham, Brooklyn, N. Y., assignor to the Lorain Steel Company of Pennsylvania. Filed Sept. 23, 1899.

675,049. Circuit-Breaker. Samuel B. Stewart, Jr., Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Jan. 21, 1901.

675,114. Electric-Motor Control. Bennet C. Shipman, Wilkesburg, Pa. Filed June 25, 1900.

675,177. Electric Switch. George B. Thomas, Hartford, Conn., assignor to the Perkins Electric Switch Manufacturing Company, same place. Filed Feb. 15, 1901.

675,293. Controller for Electric Motors. Oscar H. Pieper and Alphonse F. Pieper, Rochester, N. Y. Filed Aug. 27, 1898.

675,294. Electrical Controlling Apparatus. Oscar H. Pieper and Alphonse F. Pieper, Rochester, N. Y. Filed Feb. 2, 1900.

675,351. Safety Speed-Limiting Means. Garrett W. Hendricks, Indianapolis, Ind., assignor to the Hendricks Novelty Company, same place. Filed March 14, 1901.

TELEPHONES AND TELEPHONE APPARATUS.

674,860-674,861 674,954. Telephone-Circuit System. Ellis F. Frost, Washington, D. C. Filed June 27, 1900.

674,882. Telephone-Switchboard. Ellis F. Frost, Washington, D. C. Filed June 27, 1900.

MISCELLANEOUS.

674,858. Contact for Controllers or Reversing-Switches. John Trier, Chicago, Ill., assignor, by mesne assignments, to Donald Grant, Faribault, Minn. Filed April 26, 1900.

674,859. Automobile. John Trier, Chicago, Ill., assignor, by mesne assignments, to Donald Grant, Faribault, Minn. Filed April 26, 1900.

674,867. Circuit Operating Device. Percy C. Howe, Boston, Mass. Filed March 12, 1900.

674,927 674,934. Electrode for Electrolytic Cells. Max Mauran, Niagara Falls, N. Y., assignor, by mesne assignments, to the Castner Electrolytic Alkali Company of Virginia. Filed March 16, 1900, March 26, 1900. Renewed April 27, 1901.

674,930 674,931-674,932 674,933. Electrolytic Cell. Max Mauran, Niagara Falls, N. Y., assignor, by mesne assignments, to the Castner Electrolytic Alkali Company of Virginia. Original applications filed March 16-26, 1900. Divided and these applications filed June 14, 1900, Oct. 10-16, 1900.

674,942. Automatic Current-Regulator. Severn D. Sprong, Long Branch, N. J., assignor of one-half to James H. Harnden, Brooklyn, N. Y. Filed March 16, 1901.

674,947. Automatic Regulating-Switch. Frederick J. Tolchard, Paignton, Eng. Filed Oct. 29, 1900.

675,001. Apparatus for Connecting Electric Meters in Three-Wire Circuits. John R. Dick, Brighton, Eng., assignor to the Mutual Electric Trust, Limited, same place. Filed March 9, 1900.

675,028. Brake Mechanism for Automobiles. John Trier, Chicago, Ill., assignor, by mesne assignments, to Donald Grant, Faribault, Minn. Filed April 26, 1900.

675,056. Magnetic Separator. Thomas A. Edison, Llewellyn Park, N. J. Filed June 12, 1897.

675,065. Device for Operating and Controlling Electric Automobiles. Frank F. Loomis, Akron, O., assignor to the International Fire Engine Company, New York City. Filed Nov. 6, 1900.

675,087. Transmitter-Arm. James F. Craven, Pittsburg, Pa. Filed Jan. 9, 1901.

675,133. Transmitting-Gear. Antoine Janssens, St. Nicolas, Belgium. Filed Aug. 21, 1900.

675,158. System of Electrical Distribution. Albert S. Hubbard, Belleville, N. J., assignor to Charles A. Gould, Port Chester, N. Y. Filed April 5, 1900.

675,162. Magnetic Separator. Benjamin Noble, Detroit, Mich., assignor of one-half to John G. Dietz, same place. Filed Aug. 27, 1900.

675,292. Voltaic Shoe. Elmer E. Phinney, Niantic, Conn. Filed Nov. 3, 1900.

675,303. Electric-Fixture Base. James W. Smith, Brooklyn, N. Y. Filed Oct. 15, 1898.

675,323. Lifting-Magnet. Eugene B. Clark, Chicago, Ill. Filed May 22, 1900.

675,331-675,332. Sound Recording and Reproducing Device. Eldridge R. Johnson, Philadelphia, Pa. Filed Jan. 20, 1900.

675,349. Graphophone. Frank L. Capps and Victor H. Emerson, Newark, N. J., assignors to the American Graphophone Company of West Virginia. Filed Feb. 18, 1901.

DESIGNS.

34,577. Motor-Vehicle Frame. Edward Beach Gallaher, Philadelphia, Pa. Filed April 13, 1901. Term of patent 7 years.

34,578. Underframe for Automobiles. Harry M. Wells, Bridgeport, Conn., assignor to the Locomobile Company of America, New York City. Filed Jan. 12, 1901. Term of patent 14 years.

THE TELEPHONE WORLD.

Annual Convention of the Independent Association.

The fifth annual convention of the Independent Telephone Association of the United States of America will be held in June, on the 11th, 12th and 13th, at Buffalo, N. Y. The headquarters of the Association will be at the Iroquois Hotel, and the convention will be held in the banquet room of the Convention Hall, Virginia street and Elmwood avenue. Following is the programme:

Tuesday, A.M.—Reception of delegates, distribution of badges, tickets, etc., at headquarters, Iroquois Hotel.

Tuesday, noon.—Opening of the convention in the banquet room of the City Convention Hall, Virginia and Elmwood avenue. Address of welcome. Response by President James M. Thomas. Annual address by the president.

Tuesday, P.M.—Inspection of exhibits made by manufacturers in connection with headquarters at the Iroquois Hotel.

Wednesday, 10 A.M.—Second session of the convention at Convention Hall. Paper by Hon. S. P. Sheerin, Indianapolis, Ind., subject, "Village Exchanges, Farmers' Lines, Rates and Other Lessons." Discussion by J. B. Ware of Detroit, Mich., and T. J. Fricker, Ashtabula, O. Paper by Charles E. Wilson, Philadelphia, Pa., subject, "Independent Telephone Development East of the Alleghenies." Discussion by C. E. Stinson of Rochester, N. Y., and Senator C. W. Line of Hazleton, Pa. Reports from various States and other business.

Wednesday afternoon.—Inspection of exhibits by manufacturers in connection with headquarters at the Iroquois Hotel, Pan-American Exposition and Niagara Falls.

Thursday, 10 A.M.—Third session of the convention at Convention Hall. Reading of paper by H. D. Critchfield of Cleveland, O., subject, "Legislation and Litigation." Discussion by Ed. Kibler of Newark, O., and C. S. Bush of Fort Wayne, Ind. Reading of paper by E. B. Fisher of Grand Rapids, Mich., subject, "Bell Methods." Discussion by George W. Beers of Fort Wayne, Ind., and W. A. Bisbee of Savannah, Ga. Election of officers and unfinished business.

The officers of the Association are: James M. Thomas, president, Cleveland, O.; H. C. Young, first vice president, Columbia, Pa.; C. E. Stinson, second vice president, Rochester, N. Y.; H. E. Teachout, third vice president, Des Moines, Ia.; S. P. Sheerin, secretary and treasurer, Indianapolis, Ind.; R. F. Johnson, first assistant secretary, Saginaw, Mich.; Sam E. Wayland, second assistant secretary, Wilkes-Barre, Pa.

The Atlantic Telephone Company, which controls the franchise granted by the former city of Brooklyn to the New York & Eastern Telephone Company, and which alleges that it had a capital of \$5,000,000 all paid in, has made application to Commissioner Kearny of the Department of Public Buildings, Lighting and Supplies for a permit to use the subways and to string wires. Commissioner Kearny sent the application to the Corporation Counsel and asked him whether he was obliged to grant it "in view of the fact that there have been so many similar schemes presented to me for approval, which I have reason to believe were organized as schemes to get money out of the public or out of existing corporations, rather than for the specified purpose of operating a telephone company." The Corporation Counsel advised Mr. Kearny that he must use his judgment about granting permits.

A deal has recently been completed in Bellefonte, Pa., whereby the Central Commercial Telephone Company of that place, operating lines in Center, Clinton, Union, Huntingdon and Clearfield Counties, has been purchased by and merged into the United Telephone & Telegraph Company of Pennsylvania, a company which now owns all the former independent companies between Philadelphia and Altoona. It is hoped lines through to Pittsburg may be acquired, giving a complete line with the Bell Company. The stockholders of the Central Commercial Company will be given their preference of stock or 5 per cent. bonds in the United Company, or their holdings will be purchased outright at par.

The Maryland Telephone & Telegraph Company has awarded the contract for supplying the poles for a telephone line to Reisterstown, and hence to Westminster, Md. The line will follow the turnpike and parallel the line of the Chesapeake & Potomac Company. It is to be constructed within the next 30 days. The Chesapeake & Potomac Company is preparing to put in an exchange at Reisterstown, Md.

By the completion in Wheeling, W. Va., of a new system by the National Telephone Company of Baltimore, Md., the company has placed the rate for residence telephones at \$24 a year, and the Bell, it is said, is preparing to cut to \$15 or \$18 for the same service, with a proportionate reduction on long-distance telephones.

The Manufacture of Telephone Apparatus in Cleveland.

Telephone men say that Cleveland is fast becoming the national center for the manufacture of telephone apparatus. There are already a number of important companies for the manufacture of telephone instruments in operation as well as a number of construction companies which make a business of installing lines and switchboards for new companies.

Cleveland has long been an important center for financing independent telephone companies, but the manufacturing and construction companies are making even greater headway in national importance. The location of the city, approximately midway between New York and Chicago, gives Cleveland certain advantages for the telephone business, and the development of telephone companies in the portion of the country of which Cleveland is the manufacturing center is more rapid than farther West where the cities and towns are not so close together and therefore the development of interurban lines not so rapid.

Great Demand for Telephones in Havana.

A. F. Blundell, manager of the telephone companies in Havana, has lately been in Chicago to obtain 2,500 automatic telephones for use in the island. He says:

"Telephones there are in greater use than in any American city of the same size. People like to use them and they have become a necessity. The warm climate and the habits of the people unite to cause the residents of Havana to make constant use of the telephone.

"All that stands in the way of an immediate boom in Cuba is the Foraker resolution, which forbids grants and franchises from the provisional Government. Capital in all lines of business is simply waiting."

The stockholders of the Dauphin County, Pa., Telephone Company lately held its annual meeting, and elected the following officers: B. F. Meyers, president; W. D. Barnard, vice-president; Charles D. Stucker, secretary; C. A. Lee, treasurer; Meade D. Detweiler, was elected solicitor for the company. The contract for the construction of the new plant costing not less than \$300,000 has been let and one of the largest and best telephone systems will soon be added to the many new improvements of the capital city.

The Ford & Hiller telephone line to Early Bird, Fla., was completed a short time ago. It has two strands of wire and is first-class in all respects, and puts Ocala in communication with the phosphate mines in that region, and will be worth a great many dollars to the latter place.

M. D. Shaw of Ohio, promoter of the Orange, Tex., Telephone Company has lately been in Orange on business connected with his company. He is putting in a long-distance system that will connect the several Texas towns and cities in which the company is now busy putting in exchanges.

A resolution adopted by the Chillicothe, Ill., city council, granting T. VanAntwerp the right to construct a telephone system, has been placed on record in the recorder's office. The provisions of the resolution are that a system can be constructed, the poles to be placed in alleys where possible, and that the franchise extends for 15 years.

At a recent meeting of the stockholders of the Brookings, S. D., telephone exchange, it was decided to expend about \$2,500 in rebuilding and enlarging the plant and erecting a fire-proof office building.

The recent activity of the People's Telephone Company, in Victor, N. Y., and vicinity, has evidently stirred the Empire State Telephone Company to action, and a representative of that company was in Victor recently soliciting subscribers for a local exchange.

The Diamond State Telephone Company has spent \$20,000 in Queen Anne's County perfecting telephone lines connecting Centerville and other towns of Maryland with the system.

The Home Telephone Company of Dayton, O., has been granted a franchise by Judge McCann after a fight for several years.

The Twin City Telephone Company has filed plans with the St. Paul, Minn., building inspector of its new exchange, which will cost about \$10,000.

A new telephone line is being built from Kirksville to Quincy, Mo.

Lumpkin, Ga., is putting in a telephone system.

Consolidation of Independent Telephone Lines.

There was recently effected in New Iberia the consolidation of nearly all the independent telephone systems of Southwest Louisiana, comprising the Baton Rouge property, that at Thibodaux and the Teche and Vermillion at New Iberia. The company is now ready for business and will construct new exchanges and toll lines. The company is chartered under the name of the Louisiana & Texas Long Distance Telephone Company, Limited, with the following as board of directors: Hon. R. F. Broussard, R. F. Hoggsett, P. E. Braud of Thibodaux; L. H. Lancaster of Thibodaux, Ben R. Mayer of Baton Rouge, H. D. Giles of New Iberia.

The first officers of the company are: R. F. Hoggsett, president and general manager; R. F. Broussard, vice president; H. D. Giles, secretary and treasurer; L. H. Lancaster, superintendent of construction.

The domicile is New Iberia. The company will remodel all its toll lines with up-to-date material, and it is intended in the near future to connect up with New Orleans.

Mr. E. F. Clarke, M. P., of Toronto, Ont., has written the city solicitor of Toronto, advising that a suit be entered against the Bell Telephone Company without delay in order to fortify the city against the legislation which the company will again apply for next year. He says that it is absolutely imperative that the public mind be aroused on the telephone question, and that the validity of the claim in the act of 1892, purporting to place the rates to be charged by the company under Government control, should be determined also.

The latest institution which is making strides to enter Crowley, La., is the Texas & Louisiana Long Distance Telephone Company, which was recently formed at New Iberia by a number of the Louisiana local exchanges forming a combine. This company has stated its willingness to put an exchange in Crowley, if a subscription guaranteeing them 150 phones can be secured. Lee Adam has interested himself in the matter and is circulating the paper.

The New England Telephone Company has completed the line at North Deer Isle, Me., and connection with the main line has been established. The cable across Eggemoggin Reach is 6,050 feet long, 1 3/4 inches in diameter and weighs 11 tons.

The Chicago Telephone Company has purchased property in South Chicago and will erect its South Chicago exchange on the site, which is in the heart of the business district. The building will cost about \$35,000.

The plant of the Stromberg-Carlson Telephone Manufacturing Company of Chicago is to be enlarged by two additional stories. The work will cost \$30,000.

Permission has been granted the Ossipee Valley Telephone Company to erect poles and string wires on the various highways in Lovell, Me., and it is expected that operations will begin immediately.

The new telephone line from Unitia to Coytee, Tenn., is completed.

TELEPHONE INCORPORATIONS.

The Lima Telephone & Telegraph Company, Lima, O. Capital stock, \$150,000.

The Mansfield & Carbon Co-operative Telephone Company, Indianapolis, Ind. Capital stock, \$2,500.

The Hancock Telephone Company, Hancock, N. Y. Capital stock, \$3,000. Directors: E. J. Cotler, C. L. Wheeler and S. N. Wheeler, all of Hancock.

The Mount Ayr Mutual Telephone Company, Mount Ayr, Ia. Capital stock, \$5,000. Officers: J. H. Ailyn, president; Carl Lunney, vice-president; G. A. Wyant, secretary, and Clyde Dunning, treasurer.

The Garnaville Telephone Company, Garnaville, Ia. Capital stock, \$10,000. Officers: Arthur A. Schmidt, president; Joseph Wriell, vice-president, and R. O. Schumacher, secretary and treasurer.

The Watervliet & Green Island Telephone Company, Albany, N. Y. Capital stock, \$25,000. Directors: Samuel D. Rawson, Frederick H. Sudrow, Thomas F. Brush, Frederick W. Martin, Irving W. Griswold and E. Lord, all of Elyria, O., and Howard Hendrickson of Albany.

The Citizens' Telephone Company, Elmira, N. Y.—to operate in Elmira and Chemung County. Capital stock, \$250,000. Directors: Charles H. Stewart, Joel H. Fuller, Kerm F. F. Gill, Charles B. Stowe, Byron L. Moore and Bert G. Hubbell, Cleveland; Alexander C. Eustace, Charles H. Knipp, Charles A. Pulford and Joseph P. Eustace, Elmira.

GENERAL ELECTRICAL NEWS.

Lighting.

Arkadelphia, Ark.—J. W. Urlson of this city has purchased the plant of the old water and light company and will soon install five dynamos.

Beach City, O.—The village council is considering the question of erecting an electric light plant.

Bevier, Mo.—The citizens are agitating the question of electric lights.

Columbus, O.—Director Immel of the department of public improvements is making arrangements to erect a new municipal electric light plant on the site of the present waterworks.

Decorah, Ia.—The Decorah Electric Light Company has increased its capital stock to \$50,000.

Frankfort, N. Y.—At a recent special election here it was voted to borrow \$18,000 to erect an electric light plant.

Girardville, Pa.—Philadelphia capitalists are preparing to erect an electric light plant in this city.

Glendive, Mont.—The Hughes Electric Light Company has been granted a franchise here.

Grand Rapids, Wis.—At a recent meeting of the directors of the Electric & Water Company it was decided to increase the capacity of the electric light plant by putting in a new engine, boiler and dynamo, which will cost about 12,000.

Hubbard, O.—An election will be held June 8 to vote on the question of issuing \$8,000 in village bonds for the purpose of erecting an electric light plant to replace the one destroyed by fire recently.

Indianapolis, Ind.—The board of works and city engineer have completed the specifications for the new public electric lighting contract and they have been sent to the city attorney for legal retouching. Bids are to be advertised for soon.

Luther, Mich.—J. Bessey is prospecting with a view to putting in an electric light system here.

Manning, Ia.—An electric light plant will soon be erected here by a corporation which is now forming with \$10,000 capital stock.

McGrawville, N. Y.—This village is to be lighted with electricity.

McHenry, Ill.—This place is to have an electric lighting plant.

New London, Ia.—Civil Engineer F. Standard of Waterloo, has prepared estimates of an electric lighting plant, which it is proposed to erect here.

Omaha, Neb.—The Union Pacific contemplates installing its own electric light plant at the Union depot in this city.

Penn Yan, N. Y.—The trustees of Penn Yan have advertised for sealed proposals for lighting the village with from 50 to 70 electric arc lights for the term of one to five years from July 1, 1901. The parties bidding will be expected to furnish a certified check of \$1,000 with each bid. All bids are to be in the hands of the committee, Trustees William C. Tracy and Jasper O. Smith, by 12 o'clock noon, June 15, 1901, and same will be opened at 8 P.M.

Provincetown, Mass.—The Provincetown Electric Light Company has been incorporated with a capital of \$15,000. E. C. Holman is president and H. O. Goldsmith, treasurer.

Rome, N. Y.—The electric light and gas plant of this city is to be rebuilt. J. C. Sloan will superintend the work.

Sioux Falls, S. D.—Sioux Falls has decided to erect a municipal electric light plant.

Shakopee, Minn.—Aldermen Kauth, Ring and Spindler, the committee on electric lights, are investigating with a view to erecting a plant here.

Sharpsburg, Pa.—Bids will be received by the borough clerk until June 12 for installing electric light machinery and furnishing arc lamps, etc. F. A. Smith, E. Roesler and G. D. McMorran are on the water and light committee.

St. Joseph, Mich.—The board of public works has under consideration bids for the erection of an electric light plant.

Thorp, Wis.—The village board is making arrangements to erect an electric light plant.

Walhalla, S. C.—J. W. Shelor has been granted a

franchise for the construction of a system of waterworks, and an electric light plant here.

West Alexandria, O.—A movement has been started to organize a company, and a franchise will be asked for furnishing electric light and power.

West Stewartstown, N. H.—The William F. Allen Electric Company is preparing to extend its lines so as to furnish lights for the villages of Beecher Falls and Riverside.

Williamsport, Pa.—The Lycoming Electric Company, which has a monopoly of the electric lighting business here, will replace its two power houses with one central plant of over 3,000 horse power.

Street Railways.

Biloxi, Miss.—The new street railway in which J. Carraway is interested will erect an electric plant for power.

Boston, Mass.—A syndicate has been formed among Boston capitalists to build an electric railway in Washington, between Seattle and Tacoma, a distance of 33 miles. Lee, Higginson & Co., Kidder, Peabody & Co., and Stone & Webster are members of the syndicate.

Cumberland, Md.—A power house to cost \$80,000 will be built for the proposed electric road from this city to Lonaconing. Address J. MacCarroll, president of Penn State Construction Company, 735 Drexel Building, Philadelphia, Pa.

Dansville, N. Y.—An electric railroad is projected from here down the Genesee Valley to Rochester.

Dayton, O.—The Dayton & Germantown Traction Company has secured with one or two exceptions a private right of way for its electric line from the Dayton Soldiers' Home to Middletown.

Fresno, Cal.—Another electrical street railroad is to be built. S. N. Griffith is the promoter, and application will shortly be made to the city trustees for a franchise.

Gettysburg, Pa.—The city council has given the Baltimore, Westminster & Gettysburg Railway Company the use of streets for an electric railway.

Illipolis, Ill.—The village council has granted a franchise to Messrs. Myers & Dempsey, representatives of the new electric railroad between Springfield and Decatur, which give the company the right of way through this village.

Jackson, Mich.—The Detroit & Chicago Traction Company has purchased a site for a new power plant in this city. The buildings and equipments will cost \$250,000.

Louisville, Ky.—The question of building a suburban electric road from Charlestown to this city is being agitated.

Maryville, Mo.—This place is to have an electric line in the near future.

McConnellsburg, Pa.—A trolley line has been projected to run from Mercersburg to this place.

Rutland, Vt.—The property and franchise of the Rutland Trolley Street Railway in this city were lately sold to a syndicate of New York capitalists. An extension of the tracks into surrounding towns is contemplated.

Mobile, Ala.—The movement to build an electric railway along the gulf coast is again being agitated, and it is now announced that the contract has been let for part of the road.

New York City.—The scheme to establish a suburban electric railway between the postoffice and the towns of Southwestern Connecticut, as described last winter, has awakened those interested, and it is claimed may soon obtain the support of John B. McDonald, the chief contractor of the Rapid Transit Subway.

Oneida Castle, N. Y.—The Oneida Construction Company, incorporated at Albany with a capital of \$50,000, is to build an electric railway from here to Sylvan Beach, taking over also the franchises of the present road from Oneida to Oneida Castle. C. Loomis Allen of Lorain, O., is one of the directors.

Philadelphia, Pa.—The American Railway Company is endeavoring to secure a 50-year ordinance to permit it to build and operate an electric road in Chicago.

San Jose, Cal.—The purchase of the electric line from San Francisco to San Mateo by Eastern capitalists is considered the first step toward the building of a line between San Francisco and this city.

Santa Ana, Cal.—If the projects now under way are carried to completion, this city before very long will become an important center of electric railway lines. The Santa Ana & Orange Motor Company has obtained a franchise between here and Los Angeles, via Orange, Anaheim, Fullerton and Whittier, and another company, in which Major S. H. Finley of this city seems to be the moving spirit, is working on a right of way between Santa Ana and Long Beach.

Sheboygan, Wis.—The city council has granted J. M. Seamann a franchise for an electric railroad.

Uniontown, Pa.—The Monessen, Webster, Belle Vernon & Fayette City Street Railway Company has been organized by S. M. Graham, F. M. Fuller, C. H. Seaton and others of this place, with \$60,000 capital stock, to build an electric road along the Monongahela River for 10 miles from Webster to Fayette City.

Watertown, N. Y.—Papers incorporating the Watertown & Carthage Traction Company, capitalized at \$200,000, have been filed in the county clerk's office. The company will build a street surface railroad, to be operated by electricity, and to connect this city, Black River, Felt's Mills, Great Bend and Carthage. The length of the road will be 20 miles. Construction will be begun this summer. Arthur S. Fairchild, John W. Horner, Jr., New York City; Ernest S. Emanuel, Brooklyn; G. T. Hollister, Rutherford, N. J.; Clyde Notman, Short Hills, N. J.; John N. Carlisle, Francis M. Hugo, Leroy L. Luther and Mason M. Swan, Watertown, are the directors for the first year.

Williamsport, Pa.—The Williamsport & Lock Haven Traction Railway Company has received a charter to construct a line from Lock Haven to Jersey Shore. The company is capitalized at \$150,000. Hon. H. Cochran of this city is president.

Manufacturing.

New York City.—The Goudey-McLean Company of this city has been formed to manufacture electrical machinery with a capital of \$3,000. E. E. Goudey, Hackensack, N. J.; L. W. Miller, West Nyack, and Robert McLean, New York City, are the interested parties.—The Oak Motor Company will manufacture electric motors on a capital of \$2,000. J. P. Carl, G. B. Ackerly and Jerome Bradley of Brooklyn are the directors.

Youngstown, O.—The Anchor Electric Company, with a capital \$50,000, is being organized here to manufacture electric lamps and other appliances. N. L. Norris, R. P. Hamilton, Charles N. Crandall, Fred Keast, H. W. Davis and Thomas Carr are the promoters.

Company Matters.

Boulder, Col.—The Boulder Electric Light Company has been reorganized and the new company will be known as the Boulder Light & Power Company with \$100,000 capital stock.

Duluth, Minn.—Announcement is made of the consolidation of the Richardson Electric Company and the Zenith City Electric Company. The name of the new company is the Northern Electric Company.

Suffield, Conn.—The Suffield Electric Light Company at its annual meeting elected the following officers for the ensuing year: President, Warren W. Cooper; secretary and treasurer, Edmund Halladay; superintendent, Apollos Fuller.

Power and Transmission.

Globe, Ariz.—This town will be supplied with an electric power plant, which will be erected on Salt River, 30 miles above here.

Automobiles.

Newark, O.—The Newark Auto-Coach Company was recently formed with a capital of \$10,000.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 17@17½c.; Lake, 17½@17½c.; casting, 16½@17c.

The General Electric Company is putting up a \$250,000 office building in Schenectady.

It is reported that the Chicago Union Traction Company will not ask the city council for an extension of its franchises.

Philadelphia Bell Telephone stockholders have approved the increase in capital stock from \$6,000,000 to \$8,000,000.

Chicago Union Traction stock has been somewhat more active on the New York Stock Exchange recently than for some time past.

Chicago Telephone directors have declared a quarterly dividend of 3 per cent. and voted to increase the capital stock from \$8,000,000 to \$9,000,000.

The annual meeting of the Empire State Power Company will be held in Amsterdam, N. Y., June 11, when directors and officers of the company will be elected.

It is stated that the Lehigh Valley Traction Company, which controls and operates the Easton (Pa.) Transit Company's lines and other trolley roads in that vicinity has been absorbed by the Union Traction Company of Philadelphia.

President Insull, of the Chicago Edison Company, is quoted as saying that there is no truth in the report that his company is to be absorbed by the People's Gas Company, and that it is not probable a merger will be effected.

Stockholders of the New York Gas, Electric Light, Heat and Power Company, and the stockholders of the Edison Electric Illuminating Company have voted favorably on the proposition to consolidate with each other, the vote being practically unanimous.

At the first meeting of the incorporators and stockholders of the recently organized Edison Storage Battery Company, held Friday at Newark, N. J., Thomas A. Edison was elected president and John F. Randolph secretary and treasurer. The election of directors was deferred.

The following are quotations for some of the industrial stocks not quoted elsewhere: Electrical Lead Reduction, 3¼@4; Electric Boat, 19½@20; Electric Vehicle, 10½@12½; Tel. & Tel. Company of America (full paid) 5@6½; Electric Company of America, 8¼@8½; National Carbon, 15¼@16.

An electric power plant will be built at Lake Linden by the Calumet & Hecla Company to furnish power to operate the six heads of stamps to be installed in the addition to the stamp mill, which is now being built. The engine, Gratiot, is being converted to supply power, and other machinery is being constructed for the plant.

The directors of the Washington and Annapolis Electric Railway have effected a permanent organization. W. H. Lamprecht was elected president, Otto Miller secretary and treasurer and James Christy vice-president. The directors are: W. H. Lamprecht, Otto Miller, Frank N. Wilcox, F. T. Pomeroy and E. W. Moore, of Cleveland; James Christy, Jr., of Akron, O., and Wm. L. Marbury, of Baltimore. The company will soon open working offices in Washington. Surveyors are locating the route. The line from Baltimore to Washington will be a little more than 30 miles long.

At a special meeting of the stockholders of the American Telephone and Telegraph Company on Monday, held at the New York Office of the Company, it was voted to increase the capital stock from \$100,000,000 to \$150,000,000. Fifteen stockholders were present. The \$50,000,000 increase was authorized by a unanimous vote of the 709,560 shares represented at the meeting. President Cochrane says: "The natural growth and expansion of our business demands the increase which has been authorized. In order to avoid the inconvenience of having to call another special meeting at some future date, it has been deemed expedient to ask for an increase of \$50,000,000 at this time. This increase will enable us to extend our lines wherever a profitable business can be done." Of this \$50,000,000 increase, \$21,000,000 will be offered to stockholders at par, each holder of three shares of old stock having the right to subscribe for one share of new stock. The first payment will be called about August 1, and the second about January 1, 1902. A circular will be issued to stockholders during the latter part of the week.

Announcement of default of interest and plans for reorganization of the Washington Traction and Electric Company was issued June 1 by the majority bond holders. The reorganization committee consists of George W. Young, chairman; John C. Brown, James Timpson, William H. Hollister, Gardiner M. Lane. The offices of the bondholders' committee will be at No. 59 Cedar street, New York. The Washington Traction and Electric Company controls all the electric railways in the District of Columbia except the lines of the Capital Traction Company. It also controls the electric lighting plants. The stock and bonds of the company are mainly owned by New York people. The failure to pay the interest renders the company liable to foreclosure. The earning capacity never has been equal to the demands. The company was organized two years ago with a capital of \$12,000,000 in stock and \$20,000,000 in 4½ per cent. bonds. Its property consists of the stocks of eleven street railroads and two electric lighting companies in Washington. The deficits in the company's revenues have been made good at each successive period by those largely interested, and, it is understood, through an assessment on the stock. Saturday's action is attributed to some large holders, including Messrs. Hayward, of Baltimore, Scott, of Wilmington, Del., and F. C. Stevens, of this city, selling their stock. The purchasers, it is reported, are the Roebings, of New York. It is supposed that a floating debt has been accumulated. Some conjecture that this has reached a million dollars or more. George W. Young, one of the majority bondholders, estimates that it would be four or five years before the receipts of the company on its present basis would meet the operating expenses and fixed charges.

EDITORIAL NOTES.

Pennsylvania Demands Rapid Transit.

Much speculation and considerable discussion has been aroused over the recent action of the Pennsylvania Legislature in passing two bills with lightning rapidity, providing for rapid transit through the construction of elevated or underground railways in the large cities of the Commonwealth. The bills were passed by the Senate and House with but few dissenting votes. Neither political nor factional lines were drawn in the struggle—and the sum and substance of it all is that there will be an enormous demand for electrical apparatus from the large cities of Pennsylvania.

The passage of the bills will enable local authorities to take up the matter of rapid transit immediately, and to act upon any propositions that may be presented for the improvement of the street railway systems of Philadelphia, Pittsburg, or any other city in the State.

It is an undeniable fact that Philadelphia is behind the times, particularly so far as street traffic is concerned. To be sure good service has been furnished by the Union Traction Company of that city, but nevertheless the street corners are daily crowded with people waiting for cars, and the congested condition has forced the public to demand rapid transit.

Other cities have struggled with the same problem, and by a combination of roads—elevated and underground—rapid transit was provided, and the existing surface roads gained considerably by looking after the short-distance rider. The experience of New York, Chicago, Boston and London with a dual or triple system of transit may be cited to show that neither elevated or underground roads affect surface roads disastrously. Statistics show that when surface roads are properly managed and run on business lines the result has proven beneficial. The Metropolitan Railroad of this city in long-haul competition with the Manhattan Elevated illustrates this.

The large cities of Pennsylvania need rapid transit badly, and already there is a rush to Harrisburg by prominent attorneys of responsible corporations seeking charters to build double track and elevated roads in Philadelphia and Pittsburg. The public demand for rapid transit must be met—and of course there

are corporations without number who are willing to serve and satisfy the public.

* * *

Meeting of the Independent Telephone Association.

The Fifth Annual Convention of the Independent Telephone Association of the United States is now being held at Buffalo. That the selection of that locality for holding the meeting this year was a most admirable one is only too apparent, in view of the Pan-American Exposition. Here the delegates will have an opportunity of inspecting the latest electrical devices, including telephone apparatus, besides enjoying the sights generally, which many of them would probably have missed had not the meeting place been Buffalo.

Judging from the programme of the convention—which will be found on another page of this issue—it will prove the most instructive and important yet held. As usual the papers to be read are few in number, but this is no disadvantage, as it permits of each paper being carefully and thoroughly discussed, which is at times impossible at conventions where many papers are crowded into a session. The paper by Charles E. Wilson on "Independent Telephone Development East of the Alleghenies" should prove interesting as well as that entitled "Bell Methods." The latter should prove extremely interesting reading, if some of the methods pursued by the monopoly in Western towns are thoroughly gone into. The days of the Bell monopoly are limited, and as the Independent companies have forced the trust to the wall in many localities throughout the West, so will the Independents gradually force the monopoly to reduce rates in the East, in gaining the good will and hearty support of the public, as aptly illustrated by our cartoon which appears on page 359. Actions speak louder than words, and as we have warmly supported the Independent telephone movement in the past, so will we continue to aid the telephone cause with our best efforts in the future.

* * *

Mexican Trade.

The subject of Mexican trade and how to secure it is one of wide extent, and no one person possesses the knowledge of all the details of each branch of trade which would enable him to discuss the subject thoroughly and intelligently. The co-operation of merchants dealing in articles about

which information is sought is necessary, and this co-operation is seldom possible to obtain, as comparatively few Americans are engaged in business in Mexico. The trade is largely in the hands of Mexican, German, French and English houses, and these, although not apparently against the United States, are not enthusiastic advocates of trade expansion between the United States and her sister republic. That our electrical machinery is in fine favor there is evidenced from the large increase in the value of the importations during the fiscal year 1900, when the total value of the imports amounted to \$445,208, against \$131,730 for the preceding year. A slight falling off in the imports of scientific instruments, including telegraph, telephone and other electric apparatus, was noticeable in 1900, the value for that year being \$424,637 against \$429,188 for the preceding year.

In view of the healthy condition of our electrical trade with Mexico and the apparent desire of our manufacturers to participate more largely in the trade of that country, a few suggestions relative to that fertile field may not be without general interest at this time.

All shippers should see to it that their shipments are properly classified and entered in accordance with the Mexican custom-house tariff, and that the necessary Mexican consular invoice is taken out. Our manufacturers may be inclined to think such work superfluous and hesitate to take time and care in the methodical packing and listing of the goods, but if such care be taken when shipping the goods a world of delay, and, in many instances, fines by the custom house authorities are avoided. A manufacturer who has goods to sell will make a friend of his customer by forwarding goods in the best possible manner and listed in accordance with the laws of his customer's country.

Every manufacturer seeking trade in Mexico, should familiarize himself with the Mexican tariff. The duties are specific, and except in a very few cases, all importations pay duty by weight. Weights are of three classes—gross, net and legal. The first two are self-explanatory, but legal weight is especially a feature of the Mexican tariff, and is the weight of the article, with the wrapper, box, or whatever it may be that is next to the article, i. e., not the main outside covering, but that inside. Each package should bear its mark and number, so it can be distinguished easily, and old marks and numbers should be erased, for there is a fine for each package having more than one mark, or number, or if these do not correspond with those indicated in the consular invoice. Consular invoices and manifests should be carefully prepared as the slightest error involves the liability of a fine.

The metric system is the legal standard for weights and measures in Mexico. Our English weights and measures are stumbling blocks to the Latin countries whose trade we seek. The persistent use by our manufacturers in their catalogues, circulars, etc., of our old English weights and measures causes us to lose considerable trade with Mexico and the other Latin-American countries, on account of their being unintelligible to many foreign buyers. It would be well for our manufacturers desiring to extend their trade in Mexico and other countries using the metric system to base descriptions of their goods and estimate prices upon this metric system.

The subject of commercial credits is one of

the most important things effecting trade with Mexico. The credit system prevails throughout the republic and the practice is so firmly fixed all over the country that only a few things can be sold upon a cash basis.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

ELECTRICAL experts estimate that the total undeveloped energy of Niagara Falls is 8,000,000 horse power.

JUDGE THOMAS, President of the Independent Telephone Association, says "the future of the telephone business amounts almost to a question of how soon manufacturers can supply apparatus and material to supply the villages and towns not now covered. At the present time the business is growing faster than it can be taken care of, and there is hardly a large company in the country but what has many subscribers on the waiting list, simply because instruments cannot be secured to connect them up at once. The work in many towns is being held up for the same reason. The question of finance no longer troubles people who are well known as responsible and experienced promoters. The recent decision on the Berliner patent case has done much toward clearing the atmosphere, and together with the remarkable showing made by some of the companies has furnished capitalists with the assurance that telephone investments are safe and fruitful."

At a conference held in Albany, N. Y., on Saturday last between the board of directors of the United Traction Company and committees representing the employees of its Albany and Troy lines, the differences which have sprung up between the company and its employees during the past two weeks were amicably settled and all chances of a strike happily averted. The suspended conductors were reinstated with pay and the other matters in dispute settled to the satisfaction of the company and its employees.

A REPORT from Providence, R. I., states that the new trolley freight service which the Suburban Railroad Company inaugurated but a short time ago has met an enthusiastic welcome from the store keepers down in the Pawtuxet Valley. The merchants along the line were quick to appreciate this service, realizing the convenience of having fresh goods delivered quickly at their doors.

THE programme for the convention of the Canadian Electrical Association, which commences its sessions at Ottawa, Ont., on the 19th inst., is a somewhat elaborate one, and promises to be very interesting and enjoyable to those who avail themselves of the opportunity to attend the convention. The papers to be read at the meetings of the Association include the following: Professor Owens, of McGill University, Montreal, "Transformation From Constant Potential Alternating to Constant Current Alternating." J. R. Robertson, Montreal, "The Influence of the Lead Factor on the Design and Operation of a Lighting and Power System." K. B. Thornton, Montreal, "Notes on Construction and Protection of Aerial Transmission Lines." O. Higman, Ottawa, "Dominion Electrical

Standards." Mr. H. S. Doherty, of New York, and A. E. Slade, of Quebec, will also read papers the former dealing with the subject of rates for electric lighting. The Minister of Inland Revenue has tendered an invitation to the members of the association to examine the Government electric standards.

NIAGARA FALLS is to have another new and interesting electric furnace process for the manufacture of an abrasive to be used in the manufacture of wheels, hones, paper, etc., for which emery, carborundum and other materials are at present used. This new artificial abrasive will be made, it is understood, by fusing bauxite, which is one of the ores out of which aluminum is made.

A SHORT time ago the construction of the new system of the Mountain Telegraph Company, between Colorado Springs and Denver, Col., under the superintendency of E. E. McClintock, was begun from three separate points. It is proposed to build about 2,000 miles of telegraph line, but in no way will the new company be a competitor of the Western Union.

CHICAGO capitalists are to introduce wireless telegraphy for commercial purposes in Chicago within forty or fifty days. Preparations for installing wireless telegraph and telephone instruments in the States of Illinois, Michigan, Minnesota, Iowa and Wisconsin are now being made and within a short time wireless telegraph stations are to be established at various points in those States.

THE sixth annual convention of the International Association of Municipal Electricians will be held in the Natural Food Company's Convention Hall, Niagara Falls, N. Y., Monday, Tuesday and Wednesday, September 2, 3 and 4, 1901. The following papers will be read: "The Need and Value of a Set of Rules for Outside Construction," P. H. Trout, Jr., of Lynchburg, Va.; "Underground Electrical Constructions, From a Municipal Standpoint," Edward F. Schurig, Omaha, Neb.; "The Protection of Fire and Police Telegraph Wires From High Tension Currents of Lightning," W. M. Petty, Rutherford, N. J.; "Improved Storage Battery for Municipal Purposes," J. W. Aydon, Wilmington, Del. Papers will also be read by well-known electrical engineers dealing with the advisability of placing high and low potential conductors in the same conduits or man-holes.

THE State Department at Washington has received information of the opening for traffic of the first electric suburban railroad in Russia. It connects the manufacturing city of Lodz in Russian Poland with the neighboring towns of Zgierz and Pabianice, is 13½ miles long, and cost \$560,000. The charter provides that the Russian Government shall receive a share of the profits, shall have the right to purchase after twenty years, and that the road intact shall become Government property at the expiration of 28 years' time.

MR. YERKES when interviewed in London on June 6 is reported as saying: "We have practically got control of the London Underground Railway. That is what it amounts to. My syndicate is composed of both British and American financiers, although far the greater portion of the capital comes from the United

States. We hope to begin work in a few months, as soon as the necessary consent of Parliament has been obtained. The system we intend to install is almost exactly similar to that in use on the elevated lines in Chicago. We will sell the present antiquated cars and substitute those of an American pattern. We intend to rebuild the stations, to install arc lights and make the road equal to any rapid transit line in the world."

LONDON advises state that American manufacturers have secured the contract for electric engines on the Swiss railway up Mount Zermatt.

FROM reports transmitted by Consul General Guenther it is learned that a new electrical company, the Sociedad General Gallego de Electricidad, has been formed in Madrid, Spain, with a capital of 2,000,000 pesetas, and two of its engineers, Messrs. Ernesto Preser and Adolfo Barbe of Madrid, have been instructed to procure the necessary machinery. Another company has also been formed at Saragossa, the Sociedad de Aprovechamiento del Rio Gallegos, with a capital of 3,500,000 pesetas. This company will require a great deal of machinery and apparatus.

THE first decennial banquet of the Chicago Electrical Association held last week was productive of several addresses by members of the society and others, illustrating the great progress of electricity in the last ten years and its present influence in every channel of human intelligence. The speakers also dwelt on the immense advantages enjoyed by students in technical schools at the present day.

THE Borsig Company of Berlin, one of the largest machinery firms of Germany, lately dispatched its American employes to Ceylon to erect electrical plants, amounting in value to more than \$1,000,000. All this machinery comes from the United States.

A TROLLEY accident quite similar to the one that occurred at Leonia, N. J., a few Sundays ago, is reported from Syracuse, N. Y. While rounding a curve at full speed on the afternoon of June 5, a car on the Lakeside trolley line tipped over. There were fifty passengers on board, and half of them were injured. The usual excuse of the brakes failing to work is given as the cause of the accident.

THE New York Electric Vehicle Company, by acquiring control of the recently organized Metropolitan Express Company and through a contract with the Metropolitan Street Railway Company of New York, will shortly transport baggage from one point of the city to another. Electric trucks will connect with the baggage cars at convenient points to distribute the packages to their addresses.

PASSENGER traffic on all the surface car lines in Williamsburg, and also a large section of the western district of Brooklyn, including the bridge was put to serious inconvenience on the morning of June 5, by the burning out of the armature of a dynamo in the power house of the Brooklyn Rapid Transit Company, in Kent avenue, near Division avenue. There are six generating machines in the Kent avenue power house and the increase power demanded

by the heavy morning traffic proved too much for generating machine No. 6. Its breakdown threw an additional load on the other five generators, which were already taxed to almost their limit. The result was that the automatic circuit breaker was blown out and the power cut off.

TELEPHONE MEN AT BUFFALO.

Large Gathering of Independents—An Interesting Programme and Many Attractive Telephone Exhibits

As we go to press all arrangements have been completed for the holding in Buffalo of the Fifth Annual Convention of the Independent Telephone Association of the United States. The meeting, which is expected to be the most successful and the most largely attended yet held, convenes on June 11 and adjourns on June 13. As will be seen by a glance at the programme which follows there are a number of very interesting papers to be read,

troit, Mich., and T. J. Fricker, Ashtabula, O. Paper by Charles E. Wilson, Philadelphia, Pa., subject, "Independent Telephone Development East of the Alleghenies." Discussion by C. E. Stinson of Rochester, N. Y., and Senator C. W. Lline of Hazleton, Pa. Reports from various States and other business.

In the afternoon inspection of exhibits by manufacturers in connection with headquarters at the Iroquois Hotel, Pan-American Exposition and Niagara Falls.

THURSDAY, JUNE 13.

At 10 A. M., third session of the convention at Convention Hall. Reading of paper by H. D. Critchfield of Cleveland, O., subject, "Legislation and Litigation." Discussion by Ed. Kibler of Newark, O., and C. S. Bush of Fort Wayne, Ind. Reading of paper by E. B. Fisher of Grand Rapids, Mich., subject, "Bell Methods." Discussion by George W. Beers of Fort Wayne, Ind., and W. A. Bisbee of Savannah, Ga. Election of officers and unfinished business.

The officers of the Association are: James M.

THE ONLY BELLE THE INDEPENDENTS CARE FOR.

which will no doubt elicit full discussions that should prove of benefit to the members.

That the independent movement has proven such a success is due no little to the untiring efforts of Judge Thomas and others who have given their best efforts to the success of the cause.

At the gathering in Buffalo there will be no lack of entertainment features as a goodly number of the fair sex are expected to be present. The programme in detail is as follows:

TUESDAY, JUNE 11.

Reception of delegates, distribution of badges, tickets, etc., at headquarters, Iroquois Hotel.

At 12 o'clock opening of the convention in the banquet room of the City Convention Hall, Virginia and Elmwood avenue. Address of welcome. Response by President James M. Thomas. Annual address by the president.

In the afternoon inspection of exhibits made by manufacturers in connection with headquarters at the Iroquois Hotel.

WEDNESDAY, JUNE 12.

At 10 A. M., second session of the convention at Convention Hall. Paper by Hon. S. P. Sheerin, Indianapolis, Ind., subject, "Village Exchanges, Farmers' Line, Rates and Other Lessons." Discussion by J. B. Ware of De-

Thomas, president, Cleveland, O.; H. C. Young, first vice-president, Columbia, Pa.; C. E. Stinson, second vice-president, Rochester, N. Y.; H. E. Teachout, third vice-president, Des Moines, Ia.; S. P. Sheerin, secretary and treasurer, Indianapolis, Ind.; R. F. Johnson, first assistant secretary, Saginaw, Mich.; Sam E. Wayland, second assistant secretary, Wilkes-Barre, Pa.

New York Electrical Society.

At the annual meeting of the New York Electrical Society, held on the evening of June 6, the following officers were elected: President, Arthur Williams; Vice-Presidents, C. E. Knox, C. O. Baker, Jr., S. L. Nicholson, H. A. Lardner, George Herbert Condict, H. V. Parrell; Secretary, George H. Guy; Treasurer, Henry A. Sinclair.

Northwestern Electrical Association.

The summer meeting of this association will be held at Sheboygan, Wis., commencing on Wednesday morning, June 26. Reports and papers on subjects of special interest to central station men will be read and discussed. An attractive entertainment programme is being arranged, and a pleasant and profitable time is assured to all who attend the convention.

CALCULATING THE STRENGTH OF STEAM BOILERS.

BY W. H. WAKEMAN.

This article like many others that I have written was suggested by ideas that were expressed by correspondents, some of which do not fully grasp the meaning of rules that are given us for determining the strength of boilers, while others are based on the discovery of faults that is not easy to remedy.

Taking the tensile strength of the iron or steel, of which the shell of a tubular boiler is made, into consideration, I would say that while writers who wish to illustrate the application of rules frequently assume that the tensile strength of the plate is 50,000 pounds per square inch of sectional area, it does not mean that this is to be taken as the strength of all plates used. Some of them may run as

are wholly without the benefits accruing from judicious legislation properly administered.

Under this undesirable state of affairs it is plain that all we can do is to assume a tensile strength for the plate in the boiler that we wish to calculate the strength of and proceed to solve the problem. This is the weakest point in the whole plan, and there seems to be no efficient remedy for it.

Many boilers that are now made for land purposes have the tensile strength of the plates stamped near the center of the front head, just above the tubes, so that it is well for an engineer to look for it here when he begins to calculate the strength of a given boiler.

In the absence of this mark the conditions must be taken into consideration and an estimate made. If the plate is of iron, made by a reputable maker and claimed to be the best brand of iron plate, it is safe to assume that

hundreds of boilers do not possess more than 60 or 65 per cent. of the full strength, and when a greater strength than this is assumed it is encroaching on the margin of safety.

On the other hand, some of the joints that are used in steam boilers intended for high pressures have 80 or perhaps 85 per cent. of the full strength, therefore it is not proper to calculate on 70 per cent. and limit the pressure to the result obtained on this basis. The process of calculating the strength of a double welt, butt joint is rather complicated, but a little study and the application of standard rules for boiler joints will soon straighten out the problem.

Only a small part of the bursting pressure is taken as the safe working pressure, as it usually ranges from $\frac{1}{4}$ to $\frac{1}{3}$ of it. When an engineer wishes to determine the safe pressure he divides the bursting pressure by 4, 5 or 6, as his

JAMES MILTON THOMAS,
President of the Independent Telephone Association of the United States.

GEORGE W. BEERS,
Prominent Member of the Independent Telephone Association.

low as 40,000 or less, while others exceed 60,000 pounds.

Engineers wish to know how to determine the actual tensile strength in every case, and to this proposition I can only say that the proper way to determine this is to put a piece of the plate into a testing machine, pull it asunder and note the result. I am well aware of the fact that this is seldom practical, as engineers do not usually include a testing machine in their kit of tools, and manufacturers seldom or never put in one of them for general use.

The United States Government has made provisions for this important factor, because all of the boilers under its jurisdiction can be controlled, but land boilers in the several States are not under control of one set of laws, but are either partly controlled by various laws of more or less value as the case may be, or else

the tensile strength is 50,000 pounds. If it is made of steel, under similar conditions the strength may be taken at 60,000 pounds. There are few boilers made at the present time that have but a single row of rivets in the longitudinal seams, but where one of them is found it does not necessarily mean that the strength of the joint has 56 per cent. of the strength of solid plate. A good single riveted joint has that percentage, but it is much better to take the diameter and the pitch of rivets and calculate the actual strength of the joint, wherever it is possible to obtain these dimensions.

A good joint with two rows of rivets will show 70 per cent. of the strength of solid plate, but it is a very great mistake to assume that every kind of a joint that has two or more rows of rivets in it has just 70 per cent. of the full strength. Joints that are used in

judgment dictates, and the number used as a divisor in such a case is called the "factor of safety." Some writers have called it the "factor of ignorance," and I sometimes think that this is a proper name for it, because it is meant to cover possible defects that we are ignorant of, for if we were positively sure that the bursting pressure of a certain boiler is 600 pounds, I know of no reason why it should not be considered safe at 300 pounds in every day use, for an actual margin of 300 pounds is certainly enough to satisfy even the most cautious engineer. I am quite sure that hundreds of boilers are run on a margin that is very much smaller than this, although there is no way of determining this except by putting on pressure until the boiler fails. My reasons for thinking that the margin in many cases is much less than we calculate on are not only on account of possible defects, but because when

the conditions are right for it the material of which a boiler is made loses its strength as time advances.

As an illustration of this fact I will mention a case where an inspector struck a "through and through" brace in a tubular boiler with his testing hammer and it dropped into two pieces. This brace was undoubtedly much stronger than when it was first put into service, but long continued vibration and changes in its tension had finally crystallized it and made it unfit for use.

Because 5 is very commonly used as a factor of safety, some readers conclude that it is a number arbitrarily fixed, but this is not correct, for it is left to the best judgment of the engineer to decide what number shall be used.

The factor used on United States Government boilers is practically 4, when considered on a basis equal to that on which other boilers are rated, taking 5 as a factor of safety.

For illustration, the bursting pressure of a 66 inch boiler is 477 pounds and using 5 as a factor of safety the safe pressure is 95 pounds. The United States Government rule allows 113 pounds as the safe working pressure of such a boiler, which shows that the factor of safety is about 4. A skillfully made boiler is safe in either case when new, and after it has been used for ten years it is safer carrying a pressure that is determined by the smaller factor, provided it is used and cared for in an intelligent manner, than it is if only allowed a pressure determined by the larger factor and placed in the care of ignorant and careless firemen.

SIGNAL CORPS MEN IN THE PHILIPPINES.

BY "MECHANIC,"

At present with U. S. Signal Corps, Panay, Philippine Islands.

The long felt want of additional Signal Corps men for the Philippine service does not appear to abate. The continuance of guerrilla warfare in the interior of nearly all the islands is what is keeping the line men busy, and the operators are at it night and day. The wear and tear on the members of the corps is not so very great, as one might suppose, but the work is by no means easy and therefore every means possible is taken by the Government officials to offset this by making the remuneration as much as possible and still keep within the law. The Signal Corps men of the Philippines are given all the "extras" possible and they earn them. I have been associated with the line men in a number of enterprises in the jungle and know that every one of them is worthy of his profession.

At the present time there are about 30 officers engaged in the signal service of the Philippines, but with the lines being extended everywhere and in every direction about as fast as the line men can erect them, the work of the officers is on the increase, for they have to inspect all lines and see to it that the connections are maintained within their sections. I know of several officers whose territory is now so extensive that even with fast horses they cannot get from point to point as fast as required for purposes of inspection and directing new work or repairs to old. They must therefore depend to a large degree upon their assistants who are usually first class sergeants. These sergeants are generally well qualified as they are the men who have worked up through the different grades from private to first class private, thence to

corporal, sergeant, and finally first class sergeant, which is as high as they can get, unless it be as chief operator, before they secure a commission, and the latter, of course does not come at all except after long term of service and hard work and study. I know of some who have studied nights for months in view of taking the examinations for a commission.

One of the most perplexing problems to take

SIGNAL MEN READY TO PUT UP A POLE.

up the time and attention of the Signal Corps people is the new lines which are constantly being called for as fast, in fact, as new points are garrisoned by American troops. These new lines call for all of the necessary equipment to carry on the work either by telephone or by telegraph wire, and supplies are difficult to obtain in these islands. The United States Government has been shipping large quantities of telegraph and telephone supplies to these islands for several months and to look upon the vast heaps of appliances which are landed upon the wharfs at the seaports in readiness for the interior, one would suppose that the line men were being provided with all that is needed to put up a line and get it into operation hastily. But this is not always the case. There are always parts missing and considerable delay is caused in obtaining them. In the meanwhile the persons wanting the lines are bothering the line men about the delay. I have seen line men go to work and put up sev-

SIGNAL CORPS WAGON CROSSING A STREAM IN WET SEASON.

eral miles of wire with every other insulator left off owing to shortage of insulators.

The intention is to go over the line later and put on the insulators, but somehow the proper time never arrives and the line is handicapped thereby. Then again there is a dearth of proper instruments. There seems to be a shortage in every need and it would pay some dealer and manufacturer in telephone and telegraph supplies to have agencies on the various islands garrisoned by the troops for no other purpose than to supply the devices required to the military and private concerns. The latter

are now cutting quite a figure in the archipelago and several companies have been formed by sugar mill men, miners and rice-field operators for the purpose of erecting lines to the seaports from the interior. The miners are making money on Luzon, Mindanao, Panay and Negros and they are using some of it in the equipment of telegraph lines to assist them in the working of their business. There is considerable work going on in the private lines and before many months there will be a good demand for operators for these lines.

Here in the Philippines the telegraph operator is required to be something of a mechanic. Take for example the post where your correspondent is at present stopping. It is a sort of a central station and the troops occupy what was formerly a Spanish convent. The building is large, erected of stone and there is a nice room set off for the telegraph operator. Lines run into this building from all directions, and both telegraph and telephone instruments are employed. Only one American operator can be spared for this office under the circumstances and he is provided with several native assistants to care for the lines, carry the messages, etc. There ought to be a night operator, but there are not enough men to furnish the day force. This operator, like all of the others on the islands is obliged to do considerable mechanical work about the instruments, and hardly a day passes that he is not required to go out afoot or in the saddle from one to five miles for the purpose of locating breaks in the wire, due to storms, or the rebels cutting the wires on the poles. Then there is the mechanical work on the instruments.

This is a hard climate on the mechanism of the instruments and I have seen them thrown out after a few months' service because of the thick crusts of rust which have accumulated on the parts and which prevent the free operation of the same.

In the convent in question they seem to be taking out old and putting in new instruments every few months and in each case the instruments are fit only for the junk pile. This happens in instances where there is lack of proper care of the instruments more so than when the parts are freely wiped and oiled at intervals. Operators who are stationed in isolated offices away from the inspectors should be mechanical enough to keep the parts of the instruments clear from rust by applications of oil, and frequent brushing and wiping.

The hours of line men, telegraph operators and others connected with offices in the United States are usually so regulated that the work is not tedious. In this country there can be no regular time of rest specified, for the reason that there are not men enough in the force to permit either operators or line men to have a "lay off." Evidently this trouble will be rectified in course of time, but operators who enlist for the Philippines should bear in mind that there is work before them. The work, however, is usually exciting, and your correspondent knows of several operators in this vicinity who prefer the Philippine service. There is no lack of novelty and trouble. Many an operator will tell of the many times he has been shot at while working an instrument attached to one of the poles. The native soldiers are fully aware of the importance of the messages sent over the lines in war times and they try to prevent the sending of as many as possible by cutting wires, tearing down the poles and cut-

ting them into little pieces and by shooting into the quarters of the operators. The insurgent sharp-shooters sometimes get positions in trees on elevations a mile or so from a station, and having first secured the plan of the station open fire on the portion occupied by the telegraph operator. As soon as the firing begins, the troop forms and charges the position of the

maintain a toll bridge. The location selected was about on the line of ferry, running from the foot of Ferry street, Portland, to a point on Bridge street, Middletown, about one-sixth mile above the railroad depot. It is 800 feet up stream from the railroad bridge and 300 feet below the end of Willow Island. It will be seen that the position of the island, with the

from the sea, there is a tide of 2½ feet, and the highest known water-mark is 25 feet above low-water. The floor of bridge was placed 6 feet above the last elevation, making the distance from floor to low-water 31 feet. At low tide the depth of water in the channel is 16 feet.

Superstructure.—The width of bridge selected is that required for two lines of carriage travel and one line of electric cars. This requires 26 feet center to center of trusses. Provision is made on the floor beams for connecting sidewalk brackets in the future. The floor of bridge is designed to carry a load of 100 pounds per square foot—14 ton electric cars or a 10 ton wagon. The trusses are proportioned for a live load per foot of bridge of 1,500 pounds for chords, and 2,000 pounds for web. The material used was iron for eye bars and lateral rods, and the balance, excepting machinery, is medium steel. The allowable unit stresses are:—

Tension iron eye bars.....	12,500 lbs. per square inch.
Iron lateral rods.....	15,000 " "
Steel plates and shapes.....	15,000 " "

12,500

1

Compression —
1 + 18,000 r.

Fiber stresses on steel beams....	16,000 lbs. per square inch.
" " yellow pine beams.....	1,350 " "
Bearing on pins and rivets....	16,000 " "
Bending " " ".....	22,000 " "
Shearing " " ".....	8,000 " "

The bridge throughout has a wooden floor, consisting of 4 inches by 14 inches yellow pine joist vulcanized, spaced 2½ feet apart, and two layers of spruce plank. The lower is 3 inches thick, kyanized, laid diagonally, and the upper 2 inches thick square across. Both layers are dressed on one side. The stringers for the

MIDDLETOWN (CONN.) BRIDGE.

Largest Highway Draw Span in the world.—H. G. Tyrrell, engineer, Boston.

sharp-shooters and the latter makes for the jungle, and usually escape.

A man who has held the position of line-man, operator or other position in the Philippines is certainly well equipped for service in other countries, for here he gets the brunt of everything. I have heard many of the men say that they are crowding more experience into one year than into any three years in the United States. Here they are hard at it constantly. All sorts of experiences arise which are of benefit to the men owing to the practice they get. Often in sending messages the delicate touch of the Spanish spy can be noticed, he having broken into a message. Again the spies of the enemy often practically wreck an office and the operator upon his return is obliged to develop his mechanical ability by attempting to bring the distorted parts of the office equipment out of the ruins. The operators in the central stations are kept on the jump all the time and their ability to quickly handle difficult cases is therefore developed.

SWING BRIDGE AT MIDDLETOWN,

The Longest Highway Drawbridge in the World—Operated by Electricity.

BY H. G. TYRRELL,
Boston.

The new highway bridge across the Connecticut River, at Middletown, Conn., is 1,300 feet long, with a 26 foot roadway, and provision for two 6 foot sidewalks. It contains the longest highway swing span in the world. Beside the street traffic it carries a line of electric railway, connecting Middletown with Portland. It consists of—

Two fixed spans.....	200 feet, center to center of piers.
Two " ".....	225 " " " "
One draw ".....	450 " " " "

Up to the time of building the bridge in 1896, communication between the two towns had been kept up by means of ferries. The amount of travel seemed to warrant the construction of a bridge, so that the Middletown and Portland Bridge Company was formed to build and

channel on the west side, required the draw span to be about in the center of the river, thus making a symmetrical arrangement for the spans. The Government required two clear waterways of 200 feet each, which fixed the length of swing at 450 feet. This is believed to be the longest highway swing bridge in the world. A comparison table is given below. This table does not include a number of long-

VIEW OF OPERATING MACHINERY OF MIDDLETOWN BRIDGE.

span railroad drawbridges that have a highway attached:

Middletown Bridge.....	450 ft. long
Macomb's Dam Bridge.....	412 " "
Third Avenue Bridge.....	300 " "
Harlem Canal Bridge.....	270 " "
Cleveland Bridge, in two spans,...	279 " "
Charlestown Bridge.....	240 " "

Notwithstanding its being thirty miles

car track are 15 inch steel beams, weighing 42 pounds per foot. On each side of the road is a lattice railing with a 1½ inch pipe top. The proportions selected for the trusses are:—

200 fixed span.....	12 panels	depth 21 ft. to 27 ft.
225 " ".....	12 " "	" 21 ft. to 27 ft.
450 draw ".....	20 " (at 21 ft. 3 in.)	" 21 ft. to 25 ft.
	1 " (at 22 ft.)	

The turn-table is entirely rim bearing. Eight loading beams transfer the weight to

sixteen points on the drum, which is 4 feet deep, and 31 feet diameter. This stands on sixty-four cast steel wheels, 8 inches by 16 inches, which run between cast steel beveled treads 2 inches thick at the center. The lower tread rests on wrought steel plates bolted to the masonry. This arrangement of turn-table makes a simple construction, and is believed to be as effective for a highway draw as some of the more elaborate combinations of rim and center bearing turn-tables, which depend on their adjustment for an even distribution of load. The drum and wheels are secured in place to a center casting by means of the usual radial braces and spider frame. This center casting is set down 6 inches into the

center tower. It has large windows on four sides, and an overhanging sunshade eave. The walls and floor are double thick, and it is provided with electric heat for cold weather. The platform is reached by means of a ladder from the bridge floor. It was originally intended that the closing of the gates should be done by the operator in the tower, and, in fact, the author of this article made a complete design for electrically-worked steel safety gates. While these would cost \$950 for the two gates, they would do away with the service of two gate operators, but on account of an accident to the substructure involving extra expense, the steel gates and some other machinery were omitted.

LONGITUDINAL VIEW OF MIDDLETOWN BRIDGE.

stone pier, and secured to it by means of eight bolts, 1½ inches diameter and 6 feet long, built solid into the pier. This casting has a hollow center for the passage of wires up to the bridge.

The swing is operated by three 25 hp. electric motors of railroad type, one for turning and the other two for blocking up the ends. Besides these there is a fourth motor and a duplicate set of turning machinery all in place, which can be used in case of unbalanced wind pressure or a break in the other machinery. These two sets can be worked independently or together, at the will of the operator. Power is taken from the Middletown street wires, and a cable is laid on the river bottom and brought up on the center pier. This passes in a groove under the wheel track and up through the center casting. The operating house stands on an overhead platform in the

This last was an arrangement for closing the space between the ends of rail, where the draw and fixed span join. In cold weather this opening is liable to be 2 inches or more. As this would cause a serious jar to cars, and possibly a derailment, the author had designed machinery to close this space, while the toggles were tightening. There is also a lifting steel apron plate to cover the curved openings in the floor at the end of draw, to lift up before the bridge is opened. Instead of the moving rail, an ordinary split rail is used that can be adjusted occasionally with the changing seasons, and instead of the safety gates, a pair of temporary wooden ones are now in use.

As already stated, the blocking up of the ends is done by two separate motors at the ends of draw placed beneath the floor. It is not infrequent to bring power from the center by means of a shaft; but the writer's experi-

ence shows that for long draw spans this method is not satisfactory, as too much power is lost by friction in the boxes. The calculated deflection of the ends was 3½ inches, and after the bridge was completed and levels taken the actual deflection was found to be 3¼ inches.

Blocking up the ends is done by means of a pair of toggles at each corner. These are drawn together by two bronze nuts working on a right and left-hand screw, that is turned by bevel gears from the motor. To prevent these nuts from jamming there are electric signals that tell the operator when to shut off his power. As a general rule it is intended to simply block the ends up tight. This requires but very little power. But as there is always the liability of the blocks becoming tight from change of temperature or other causes, the end machinery was proportioned to lift 50 tons at each corner, 1¼ inches in ten seconds. This required 10 hp., but it was thought best to use the same kind of motor used at the turn-table, giving interchangeable parts. To provide for expansions, the end toggles rest on cast steel rockers of 17½ inches radius, which in turn bear on cast-iron pier plates, blocked up to the right elevation with shims. The floors of fixed span and draw were made to level up, by notching the joist.

The latch is an extra heavy swinging gravity latch, to which is attached a line of No. 10 wire passing over pulleys to the center and connected by means of bell cranks with the operator's house.

To open by electric power takes 30 seconds, and the power required to overcome an unbalanced wind pressure of 5 pounds per foot on one-half of bridge is 30 hp. Ordinarily, however, in calm weather 5 hp. is sufficient to turn. It was necessary to use about four times the amount of resistance ordinarily used on street car work with the same motors. The reason for this is evident when the relative weight of bridge and car is considered. Both the center and end sets of machinery are provided with clutches, which can be thrown out of gear, and the operation performed by hand power. Working on 10 foot levers, the bridge is turned by four men in eight minutes. There is a friction brake applied to a drum on the highest speed turning shaft. This and the other turning machinery, including the motor, are placed on the outside of drum beneath the floor in a machinery frame that can be sheathed in and protected from snow and ice. The whole bridge is well lighted with incandescent lamps, and has also the usual signal lights required by the Government.

BATTERIES USED IN TELEPHONY.

BY F. KERR HIGGINS.

This subject has not received the attention it deserves, and the result is consumers continue to change from one style to another without keeping any record of their tests, and after considerable waste of money, loss in efficiency, etc., they return to the old standard types. It is to be expected that in the desire for higher efficiency, we should try new types, but in doing so we must keep a careful record of the results obtained. In order to do this a low-reading voltmeter of a standard type should be used, and regular tests made under conditions found necessary to be fulfilled by the battery wanted. It is to be regretted that more care is not taken in selecting batteries, and still more, that, having once se-

lected them, they do not get the high efficiency from them they should. This is partly due to lack of proper literature on the subject, and also to carelessness in following the instructions from manufacturers. That batteries form an important factor in efficient telephone service will not be denied, nor the fact that high efficiency can only be had by having first a suitable battery and then by maintaining it properly. In local battery systems, the work of maintaining them is often relegated to a student, who is not always the most careful in his work. He usually thinks his work unimportant; his interest decreases with the monotony, and he eagerly looks forward to a change, not realizing that he is neglecting a splendid opportunity for studying a very important branch of the business. In common battery systems this is overcome by having a large storage battery at the central office constantly under the eye of an expert. Where this is not so, greater damage can be done by negligence and ignorance than in the local battery system, but the investment is so great that companies usually provide a good man to take care of their accumulators. The attention necessary is very little, but must be constant and thorough. That the talking in a common battery system is not as good as in a local battery system up to full standard is admitted, but it is, as a rule, more uniform and superior to the average local battery system.

In telephony, batteries are divided into two separate classes, known as primary and secondary. We will treat first the primary cell, but, before doing so, it will not be amiss to define some of the terms to be used: Current (*c*) is electricity in motion and its unit is the ampere; electromotive force (EMF.) is the pressure forcing the current, the unit being the volt; resistance may be defined as the hindrance placed in the path of the current, the unit being the ohm. The relation of each to the other is clearly defined in Ohm's Law: "The strength of the current in any circuit is directly proportional to the electromotive force developed in that circuit, and inversely proportional to the resistance in the circuit, this is usually expressed as follows: $C = \frac{EMF.}{R}$

EMF. = $C \times R$ and $R = \frac{EMF.}{C}$." Electrolyte is the

liquid contained in the cell (commonly called the exciting liquid). The electrodes or poles of a battery (or cell) are the metallic terminals (or conductors) attached to the plates, separately they are called the anode and cathode. It should be remembered that the polarity of the element acted upon by the electrolyte is the opposite sign to its electrode, e. g., the wire attached to the zinc pole is — sign while the zinc itself is + sign. This should be watched as it sometimes causes confusion and trouble in arranging cells of a battery so as not to oppose each other. A primary battery may be defined as a number of cells so arranged as to form a single source of electric supply. Almost all local battery systems have primary cells at the subscriber's stations.

We know electricity will flow away from a charged body through any conducting substance to ground or on a short circuit, and that a current always flows through such a medium if the ends are kept at different potentials, therefore we will assume, for convenience, that electricity flows from a positive to a negative. It is also obvious that if (in any

way) electricity could be supplied as fast as it was used, we would have a continuous current; such currents, so far as this paper is concerned, are supplied or derived from a battery. The contact of dissimilar metals (as copper and zinc) are known to produce a current, these are sometimes called voltaic elements, and a voltaic battery is a number of these properly arranged and connected together. If we take a piece of pure zinc and put it in sulphuric acid it is attacked very slightly by the acid; but if the ordinary zinc is used, it is attacked more strongly and sulphate of zinc is produced, hydrogen gas is liberated (as can be seen in the small bubbles which rise to the

produce the current, one of the metals must be readily oxidizable, and zinc (pure) is found to serve the purpose best, and is used in all primary cells. The electrolyte also must be such as will act readily on this metal, but is not the same in all cells, as will be noticed in the descriptions. It is well to notice here that in a good cell when the circuit is open (on open circuit cells) no current should flow and no chemical action should take place, and when this latter does exist it is generally due to impurities in the zinc or weak depolarizing substance or liquid, and is termed local action. Amalgamating the zinc (covering it with a coating of mercury), done by immersing it in

FIG. 1.

Storage Battery and Charging Machine. EMF. at cell terminals, 2 volts; capacity, 24 transmissions.

surface from around the zinc), the water is decomposed and the liquid becomes hot. Now insert, with the zinc, another piece of metal, this time using copper, and touch the two together at the outer end, and the action is increased. The bubbles of hydrogen now forming around the copper element before coming to the surface. It will be observed that the heat produced when only the zinc was in the acid now disappears and the energy expended is turned into electricity, as can be seen by making a voltmeter or electrometer test. It will also be observed that one of the elements becomes positive and the other negative. The zinc copper plate and liquid will be + when circuit is open, but when closed the copper will be — and the zinc + under the liquid and the opposite sign at the electrodes, the current flowing from the + to the —. The electricity is held in the cell until the contact of the dissimilar metals, that the current flows is demonstrated by, (1) heat produced, (2) affecting a magnetic needle laid along its path, (3) decomposes water, (4) magnetizes, etc. In order to

Fuller solution, or other strong acid to clean it, and then in mercury will greatly reduce this and also be a saving of zinc. Where a copper wire is used to connect to the zinc and passes through the electrolyte, as in Fuller cell, this also should be coated with mercury.

Polarization is known as the formation of hydrogen bubbles on the copper (or carbon) plate and has a tendency to weaken the current by increasing the resistance to its flow and setting up an opposing EMF. to the original current. Three methods have been used to counteract this, chemical, mechanical and electrochemical, e. g., a highly oxidizable substance added to the liquid, such as nitric acid, chloride of lime, potash, etc., air blown into the cell and the surface of the plate made rough. A good primary cell then will embody most, if not all, of the following requirements:

1. Low internal resistance.
2. Recuperate quickly.
3. EMF. constant.
4. Free from local action or polarization.
5. Construction cheap and easily renewed.

6. Interior of cell always exposed to view.
7. Electrodes protected from fumes, gases, and electrolyte.
8. Should be lasting and not readily exhausted.

The internal resistance of a cell can be increased or decreased by varying the size of the plates, also by bringing them nearer to each other and by using suitable liquids.

The Leclanché cell is perhaps the most popular of all cells because of its simple construction, and it very nearly fulfills all the requirements stated; this is especially serviceable for transmitters of low resistance, such as the Blake and modifications of it. This form of

FIG. 2.—DIAGRAM SHOWING CELLS IN SERIES.

cell has zinc carbon elements with an electrolyte composed of water and sal-ammoniac (chloride of ammonia NH_4Cl), the depolarizer being peroxide of manganese (MnO_2), contained in a porous cup (or sack); this latter slowly yields up oxygen, thus destroying the hydrogen bubbles. It is very constant and lasting, and, properly cared for, gives good results when a strong current for a long period is not necessary. The average resistance is about 4 ohms, but the porous exterior of the cup must be kept in good condition to keep the resistance down to this figure. The quality of the sal used is very important and should be watched carefully and each lot tested. The ordinary sal usually contains lead, which forms crystals around the zinc (much in the same way as the use of too much sal), this grows and finally short-circuits the cell, exhausting it the same as a piece of wire connected directly across the electrodes. A good simple test for the quality of the sal is to pass it several times through the flame of a Bun-

FIG. 3.—DIAGRAM SHOWING CELLS IN MULTIPLE

sen burner or an inspector's soldering torch and observe the sediment left. In pure sal there should be none and the quality will be in proportion to the amount left. The pure sal in this test passes off in white fumes which are unpleasant and should not be inhaled. The salts very frequently creep over the glass jar, and can be prevented by dipping the mouth of the jar in hot paraffin. The amount of sal necessary is about five ounces. It is real economy not to use cast zinc in this cell, but only that cut from rolled sheets. The amount of zinc consumed is about twenty-five ampere hours' per ounce of pure zinc. The EMF. is 1.5 volts, the porous cup becoming discolored (rusty color) is a sure sign of exhaustion. The

contacts at the poles should be clean, tight and well protected as they corrode very readily, increasing the resistance of the circuit. Always keep the glass jar clean that you may readily observe the condition of the cell.

DRY CELLS.—These are very frequently used and have been tried over and over again, but so far I have never seen any that gave satisfactory results in telephone work. The theory is good and may yet be successful, but for the present I do not find it true economy to use them. The trouble is they will not stand hard work like the Leclanché, cannot be depended upon, recuperate very slowly and some of them not at all; they generally give out suddenly and without notice, a fatal fault in telephony. The internal resistance is usually high and many of them polarize very badly.

THE LEE FULLER CELL.—Where a stronger current is necessary, this cell gives perhaps the best results, the only drawback being in handling the solution, which is very injurious to clothing, carpets, etc. This has been overcome by the introduction of a powder called "votak," put up in tin boxes and very convenient, but the results obtained from its use are not as good as by using the solution supplied in carboys. This solution (electroton fluid) is a bichromate solution, composed of sulphuric acid two parts, water four parts and potassium bichromate one part, this latter is dissolved separately in boiling water and, when hot, is mixed with the other ingredients. All parts are measured by weight, and the solution may be diluted to suit requirements. The cell consists of a glass jar, porous cup, zinc (with wire attached) and a carbon plate, the whole being covered with a wooden top, which also serves to keep the elements apart. In setting up, pour into the porous cup a small portion of mercury (about the size of a dime) then add just a pinch of common salt, into this is placed the conical zinc (wire and zinc previously well amalgamated), then fill up porous cup with soft water till within two inches of top and place the whole in the glass jar, pour solution all round it and to the same height as the water in the porous cup; into this outer solution (through the top) place the carbon plate, pass wire connected to zinc through top and close down, and cell is at once ready for use. The resistance of this cell is about 1.25 ohms, and the EMF. 2.1 ohms, and is well suited for the average long distance transmitter, two of them being connected up in series. In renewing do not attempt to use the old solution if it is of a very dark color, but clean out the whole cell thoroughly, saving the mercury and the zinc, if not too far gone. These, or some form of them, constitute standard cells for open circuit work.

GRAVITY CELL.—This form of cell is really the only one worth considering for closed circuit work. The most popular form is the crow-foot, deriving its name from the peculiar form of the zinc. It is a form of Daniell cell, and depends on the difference in specific gravity of the two liquids to keep them apart. It is a curious fact that when the current is flowing through the cell the chemical action keeps the two liquids separate, but if for any reason the current ceases to flow, they gradually intermix, and, copper sulphate forming, comes in contact with the zinc and produces local action exhausting the cell. To avoid this, they should be used only on closed circuit work, for which they are specially adapted. In setting up this cell, spread out the copper so as to form a six-pointed star, straighten out the wire at-

tached to copper and bend end over outside of glass jar (this wire should be insulated with good rubber) allowing the copper to rest on the bottom of the jar, drop the crystals (lumps) of sulphate of copper (blue vitrol) between and all around the leaves of the copper; about two lbs. is sufficient for one charge. The jar is generally eight inches high and six inches wide. The copper is made up of three pieces of sheet copper two and one half inches long, riveted together in the center, so that when spread out it forms a six-pointed star. The zinc usually weighs about three pounds and is shaped like a crow's foot, and is hung on the tip of the jar by a lug provided for that purpose.

All the elements being in position, pour in some clean, soft water until the zinc is covered; then leave cell on short circuit for five or six hours before using, or if it must be used at once, add a little sulphate of zinc, being careful not to put in the zinc element until the solutions have separated, known by the lower solution becoming a deep blue color, and the upper clear. The EMF. of this cell is about 1.1 volts and the internal resistance about .5 ohm. The maintenance of this cell is very simple, it being only necessary to add from time to time a few copper crystals as the deep blue color fades or gets below the level of the copper element. Occasionally it will also be necessary to draw off a little of the zinc sulphate and replace it with soft water; apart from this, the cell should be disturbed as little as possible. It is scarcely necessary to consider other forms of the Daniell cell as this one is standard, can be relied upon and all others are on the same principle.

Primary batteries are usually costly in materials, but when once set in operation require very little care. They are, in many systems, an absolute necessity, and few systems (if any) exist where there are not some in use. In many systems the closed circuit battery is no longer a necessity for use on switchboard transmitters as they are superseded by dynamo-electric machines or accumulators (Fig. 1). In telephony the amount of current necessary is very small, and almost any good cell, with a voltage from one to two volts, will serve the purpose on low resistance transmitters; and a battery (more than one cell) of from three to four volts for long distance transmitters. In the selection of cells, attention should be given to the mechanical construction; all materials should be of the best quality, all binding posts firmly fixed to the elements, they should be well protected from contact with the electrolyte and fumes from same. In setting up, all the available surface should be made use of, leaving only enough of the elements exposed to connect to leading in wires, in this way a great saving in materials is effected and the life of the battery prolonged. It is found, in practice, useless to try to save any of the substance left after the action of the battery, as the cost of collecting is not found to justify its accumulation.

CONNECTING UP CELLS.—When several cells are connected together in series (Fig. 2) of same size and kind, their combined resistance would be that of one cell multiplied by the total number and their EMF. would be found in same way. When connected in parallel (or multiple) (Fig. 3) the total resistance would be one cell divided by the total number and the EMF. that of one cell.

It will be seen, from the foregoing, that if the external resistance is small it will do no good to increase the number of cells in series if

more current is desired, as the resistance increases as fast as the EMF; neither will any perceptible increase in current be observed if the external resistance is high and cells are added to in parallel, as the resistance remains nearly the same and the EMF. is stationary.

The best methods of connecting up cells can be obtained by applying Ohm's Law, already

given: $c = \frac{EMF}{R}$, and the following rule: The maximum current will flow when cells are so grouped that the internal and external resistances are equal. It is therefore necessary in installing to pay close attention to the resistance of the circuit and the cells so that they may be grouped to the best advantage.

(To be concluded.)

COMMERCIAL PARAGRAPHS.

The Farr Telephone & Construction Supply Company, 118 and 120 Jackson Boulevard, Chicago, has on hand at all times a line of high grade telephones and supplies of different kinds, which it might be well for intending purchasers to examine. This well-known concern has magneto bells for bridging or series of

FARR TELEPHONE COMPANY NO. 4 BI-POLAR RECEIVER—VERY STRONG MAGNETS.

from 15,000 to 100,000 ohms resistance. Its switchboards embody the most up-to-date types and the very best workmanship. That the telephone apparatus of the Farr Company is fully appreciated by the trade may be inferred from the fact that forty county telephone lines in the State of Illinois alone are using its telephones to say nothing of numerous exchanges in other States. A catalogue may be obtained by addressing the company as above.

Something New in a Desk Lamp.

The Smith & Hemenway Company of 296 Broadway, New York City, is introducing the Ferguson Adjustable Lamp Bracket, which is one of the most novel and up-to-date roll-top desk lamps on the market. It is adjustable to any size roll-top desk or upright piano and can be fastened on without the assistance of screws or nails. The reflector can be placed at any desired angle to prevent a glare in the eyes. It is ornamental because it is handsomely finished in enamel and nickel. It is the most reasonable priced lamp on the market, and at the same time, very durable. It is simple in construction and operation, and is quickly adjusted. There are no springs to get out of order or make bad contact. The accompanying cut illustrates a few of the angles at which it can be placed.

Illustrated matter and circulars of the lamp will be furnished to parties desiring same.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED JUNE 4, 1901.

ELECTRIC RAILWAYS AND APPLIANCES.

- 675,522. Trolley-Pole. Charles Nicholson, Springfield, Mass. Filed Sept. 5, 1900.
- 675,523. Street-Car Fender. George A. Parmenter, Cambridgeport, Mass. Filed Aug. 23, 1900.
- 675,580. Car-Fender. Charles W. Adams, Washington, Pa. Filed Jan. 25, 1901.
- 675,667. Electric Brake for Railway-Cars. Frank C. Newell, Wilkinsburg, Pa., assignor to the Westinghouse Air Brake Company, Pittsburgh, Pa. Filed March 28, 1900.
- 675,668. Electric Brake. Frank C. Newell, Wilkinsburg, Pa., assignor to the Westinghouse Air Brake Company, Pittsburgh, Pa. Filed April 28, 1900.

ELECTRIC LIGHTS AND APPLIANCES.

- 675,598. Adjustable Protecting Device for Electric Lamps. Edwin J. McAllister, Almon D. Page and Louis C. Warner, Newark, N. J., assignors to William Farley Brewster, New York City. Filed Feb. 28, 1901.
- 675,427. Electric Heater for Electric Glow-Lamps. John Van Vleck and William N. Stevens, New York City. Filed April 27, 1900.
- 675,599. Electric-Arc Lamp. Daniel Higham, Winthrop Highlands, Mass., assignor to the General Electric Company of New York. Filed Nov. 21, 1900.
- 675,640. Apparatus for Removing Electric-Light Bulbs. Frederick H. Renaud, Wilkes-Barre, Pa. Filed Jan. 2, 1901.

ELECTRICAL MACHINERY AND APPARATUS.

- 675,517. Controller for Electric Motors. Frank A. Merrick and Emmett W. Stull, Johnstown, Pa., assignors to the Lorain Steel Company of Pennsylvania. Filed Aug. 28, 1900.
- 675,518. Armature Ventilation. Frank A. Merrick, Johnstown, Pa., assignor to the Lorain Steel Company of Pennsylvania. Filed Oct. 25, 1900.
- 675,557. Electric Igniter for Explosive-Engines. Walter H. Cotton, Chicago, Ill., assignor of one-half to Albert Kunze, same place. Filed May 21, 1900.
- 675,614. Electric Switch. Johan M. Andersen, Boston, Mass., assignor of one-half to Albert Anderson, same place. Filed Jan. 17, 1900.
- 675,675. Armature and Magnet Adjusting Device for Relays or Other Electric Instruments. Ulysses G. Rogers, New York City. Filed March 5, 1901.
- 675,811. Equipment of Electric Cranes. Henry Burrell, Glasgow, Scotland. Filed Oct. 1, 1900.

TELEPHONES AND TELEPHONE APPARATUS.

- 675,377. Signaling Device for Telephone-Switchboards. Harry C. Dodge, Cleveland, O. Filed Dec. 21, 1900.
- 675,378. Pay-Telephone. Charles E. Egan, Durham, N. C. Filed March 15, 1901.
- 675,487. Telephone Speaking-Tube or Like Receiver. Hahnemann A. Cutmore, Lee, Eng. Filed March 31, 1900.
- 675,685. Extension-Bell for Telephones. Vandiver J. Van Horn, Keokuk, Ia. Filed April 12, 1900.

MISCELLANEOUS.

- 675,379. Automobile. Rollie B. Fageol, Des Moines, Ia. Filed Sept. 11, 1900.
- 675,383. Automatic Electric Cut-Out. Frank E. Greenstreet, Holborn, and Edwin J. Selby, Birmingham, Eng. Filed June 12, 1900.
- 675,390. Battery-Casing for Motor-Bicycles. Robert M. Keating, Middletown, Conn., assignor to the R. M. Keating Motor Company, Portland, Me. Filed Dec. 8, 1900.

- 675,708. Battery-Tray. James R. Blackwell, New York City. Filed Feb. 15, 1901.

This is one of the young and enterprising houses in the tool line and has forged its way forward in the past few years so that the majority of the old houses have begun to wonder from what part of the country they came. They are the publishers of one of the most novel catalogues issued by any house that we know of. It is known as the "Green Book of Hardware Specialties." A copy of same will be sent free upon application.

THE TELEPHONE WORLD.

To Oppose the Bell Telephone Company's Underground System.

S. P. Sheerin, president of the Independent Telephone System of Indianapolis, Ind., has begun negotiations for opposing the Bell Telephone Company's interests in the gas belt. He proposes to launch a mammoth independent enterprise, with headquarters in Muncie, Ind., with a number of branches and cut the rates for service. The system will be complete and underground. The long-distance connection will be made with his system at Indianapolis, reaching all of the cities of the State. Local business men advocate the movement and will purchase a portion of the stock. Petitions for a number of exchanges throughout the county will be presented soon. A rate war is anticipated as soon as the work on the new system begins.

The work upon the new telephone company's system in Memphis, Tenn., is progressing satisfactorily. James S. Warren, secretary of the new company, states that the success of the company was already assured. Subscribers are coming in at a satisfactory rate, and by October it is expected that the system will be in perfect running order. Already arrangements are being made for the extension of the system to all the principal towns within a radius of 150 miles of Memphis.

The Milwaukee, Wis., Electric Railway & Light Company will soon begin the work of replacing its entire telephone service, and also extending it to points not heretofore reached. General Manager John I. Beggs says that from \$30,000 to \$40,000 will be expended for the improvement. The system to be put in will be the Stromberg-Carlson system. It will reach to all points on the suburban and interurban lines, as well as to new points in the city where it may be found desirable.

The New York and Pennsylvania Telephone & Telegraph Company is making changes and improvements in Binghamton, N. Y.; the work is to cost about \$30,000. The installing of the new boards and batteries is under the direction of the company's engineer, B. C. Wolverton of Elmira, and Manager Sexsmith of Binghamton will superintend the outside work.

The new rural telephone line between Elcho and Enterprise Lake, Wis., the first to be established in Langlade County, is proving a great success and will probably be extended considerably this year. The line already connects five large farms and passes through a rich agricultural district that is being rapidly developed.

Farmers in the vicinity of La Fontaine, Ind., held a meeting recently to take steps for the organization of a telephone exchange. The proposition is to establish a central station at La Fontaine and connect the homes of farmers within a radius of five miles. It is practically assured that the system will be put in at once.

Several independent telephone companies have consolidated in Wisconsin, under the name of the Fox River Valley Telephone Company. It will be the strongest competitor of the Wisconsin Company, and one of the largest independent companies in the Northwest. The headquarters will be at Appleton.

The Fond du Lac, Wis., Street Railway Company, in which H. F. Whitcomb of Milwaukee is the heaviest stockholder, is to install a private telephone system to be used by the carmen in reporting any accident or happening on the lines. The system is to be the same as that in use in New York, and is the first to be installed in Wisconsin.

The Easton, Mich., Independent Telephone Company is building a telephone line through Easton and Orleans, Ionia County. W. A. Strong is manager.

The Mason County, W. Va., Telephone Company is extending its line from Point Pleasant to Mason City; also via Flat Rock to Jackson and Roane Counties.

The Citizens' Telephone Company of Grand Rapids, Mich., has increased its capital stock from \$550,000 to \$1,000,000. The company owns 29 outside exchanges and is preparing to build three more.

The Farmington Valley, Conn., Telephone Company has filed in the office of the Secretary of State a certificate of an increase in its capital stock from \$3,500 to \$7,000.

The People's Telephone Company of Knoxville, Tenn., intends to spend \$50,000 on improvements.

A telephone line is being built from Shrewsbury pond to Cuttingville, Vt.

Result of Telephone Rivalry.

According to a Baltimore, Md., paper, rivalry between the two telephone companies has brought about free telephone and messenger service temporarily at West Arlington. Pending the completion of the service in that section, which is expected to be in readiness by July 1, the Maryland Telephone Company has placed an instrument in the United Railways waiting room, which may be used free of charge. An attendant is there, in addition to a bicycle messenger boy, who will deliver telephonic messages free of cost between 9 A.M. and 6:30 P.M. within a radius of one half mile from the station. The company expects to have its Pikeville and Catonsville exchanges in operation by the end of the month, and the line to Belair, it is stated, is about completed.

The National Telephone Company of Wheeling, W. Va., now announces that it will have some telephones in working order by the middle of next month. Work on the switchboard is being prosecuted rapidly and it will soon be completed. The linemen are now running the wires into the exchange. The company claims to have 1,600 subscribers, with promise of several hundred more when the line is in complete operation. The Bell people in taking new contracts are agreeing to meet any cut that might be made.

An innovation in telephone service has been inaugurated by an Indianapolis, Ind., firm of grocers, who has signed a contract with the Central Union Telephone Company for fifty instruments, to be placed in the homes of customers. The telephones are to be used by the customers in placing orders for groceries, and this service is to be free of charge. But should they desire to make other calls, a fee of one cent is charged each time.

The Interstate Telephone Company is negotiating for the purchase of the Burlington County, N. J., telephone line, which extends to nearly all parts of that county. Representatives have been at Mount Holly during the past few days buying up the stock, and it is said that they now have enough to hold a controlling interest.

The Overton Telephone Company is putting in an exchange at Cookeville, Tenn. The company has a large force of men at work in Putnam and the adjoining counties putting up poles and wires and is fast completing its lines in that part of the State, and will soon have a large system in operation.

Mr. Sheerin sent out a personal letter to the managers of the Independent telephone companies in Indiana asking for the exact number of Independent and Central Union telephones in each county. He will make up a report from this and incorporate it in his annual report at the National meeting of the Independent companies at Buffalo.

W. J. Martin, superintendent of the contract department of the People's Telephone Company of Detroit, Mich., says that every farmer in Wayne County who wishes it will be connected with the People's Detroit exchange without any extra expense to the farmer.

The Kinloch Telephone Company at Alton, Mo., has received several carloads of poles, which will be placed in position within a few weeks. The company announces that it expects to have the Alton exchange in operation by October 1.

The Stock Telephone Company, which was organized in Bruce, Wis., some time ago, is receiving poles and distributing them along the Soo between Cameron and Prentice, with the intention of starting work at once.

The Northeastern Pennsylvania Telephone Company has completed its Ararat, Jackson and Gelatt line, except to string the wires, and the Thompson and New Milford line is under construction.

Harmony, O., township farmers have organized the Home Telephone Company, with \$10,000 capital, and the following officers: President, C. A. Snyder; secretary and manager, E. E. Hodge; treasurer, D. H. Campbell.

The New England Telephone Company has commenced work in North Easton, Mass., prior to the establishment of a local exchange.

The Mandan, N. D., and Northwestern Electrical Company has completed setting the poles and stringing the wires on its new telephone line from Mandan to Oliver County.

The Bell Telephone Company will soon put in new 'phones at Johns, Ala.

Kenton, Tenn., is soon to have three telephone exchanges.

Long Distance Telephone for New Mexico.

Abraham Kempenich, a general merchant of Peralta, N. M., is the original promoter of a long distance telephone line to connect Albuquerque with the principal river towns of Valencia County, and has subscribed toward the proposition. He was lately in consultation with the officers of the Mutual Automatic Telephone Company of Albuquerque and announced before his departure for Peralta that he has assurances that the line will be constructed in a few weeks. Besides himself, twelve other merchants, south of Albuquerque, are subscribers, and the towns to be connected are Isleta, Peralta, Belen, Los Lunas, Esmeralda, Tome and Valencia. Merchants of Albuquerque will also be petitioned to subscribe.

The charter of incorporation of the Mississippi Telephone Company is being published. The purpose for which this company is formed is to build and operate telegraphic lines between Meridian, Miss., and New Orleans, La.; between Jackson, Miss., and Mobile, Ala., and from Laurel in a northerly and in a southerly direction along the proposed line of the Kingston and Central Mississippi and Laurel and Waynesboro railroads.

The Mitchell-Grange telephone line has been completed between Mitchell and Grange, Ga. The stockholders of the line hope to have connection with Louisville shortly. From Louisville, the line will have connection with Augusta, Atlanta and other points.

At a meeting held in Silvertown, Tex., capital stock to the amount of \$1,200 was subscribed to build a telephone line from Silvertown to Estelline, on the Fort Worth & Denver City Railroad, a distance of 65 miles. The line will be rushed through and will soon be in operation.

Fire in the construction department of the New York & New Jersey Telephone Company's plant at No. 124 West 50th street on the morning of June 5 did \$10,000 damage.

The Owosso, Mich., common council has accepted the Bell Telephone Company's offer to put in 'phones in every city official's house free of charge.

The Kearsarge, N. H., Telephone Company has notified the Secretary of State of an increase of its capital stock to \$10,000.

A franchise has been granted to the American Telephone & Telegraph Company to establish a long-distance telephone system at Greenville, S. C.

The Cannon Valley Telephone Company is putting in the local telephone exchange at Elysian, Minn. This exchange will connect with the Greene & Western long-distance line.

The Peninsular Telephone Company has begun work on its proposed underground system in Tampa, Fla.

A telephone line is to be placed between Chesham and Breed Pond, N. H.

Melrose, Minn., will have a telephone system.

TELEPHONE INCORPORATIONS.

The High Grove Telephone Company, Bardstown, Ky.—to construct and operate telephones in Nelson County.

The Kiowa & Comanche Telephone Company, Comanche, Tex. Capital stock, \$5,000. Incorporators: F. T. Cook, J. A. Tuipiel and J. W. Malone of Cloud Chief.

The Hopkinton Telephone Company, Hopkinton, Ia. Capital stock, \$3,000. Officers: S. P. Carter, president; C. E. Reeve, vice-president; F. C. Reeve, secretary, and J. S. McConnell, treasurer.

The Home Telephone Company, Cook, Neb.—to establish, maintain and operate an independent telephone system in Cook, with long-distance connections with other independent systems in the southeastern section of the State. Capital stock, \$30,000. Incorporators: J. J. Brown, G. G. Betzelberger and H. F. Canon.

The Hudson and Middlesex Telephone & Telegraph Company, Trenton, N. J.—to begin operations at a point under the Hudson River, in the County of Hudson, at the easterly line of said county, where said lines will connect with lines of telegraph or telephone, or both, without the State of New Jersey, and continuing thence through the counties of Hudson, Essex, Union, Middlesex, Monmouth, Mercer, Ocean, Burlington and Camden, to a point under the Delaware River, at the westerly line of said County of Camden, where said line will connect with telegraph or telephone, or both, without the State of New Jersey. Capital stock, \$15,000. Incorporators: Bryan S. Klotz, Sylvester M. Cooley and Walter P. Lindsley.

GENERAL ELECTRICAL NEWS.

Lighting.

Alexandria, La.—A new power house will be erected for the city electric light and waterworks plant. I. W. Sylvester, city engineer.

Anderson, Ind.—An appropriation of \$25,000 has been recommended for improving the electric light plant and waterworks. Address Mayor Dunlap.

Bloomington, Wis.—This town is talking of electric lights, and it is proposed to organize a stock company for the purpose of building a plant.

Cape May, N. J.—The Cape May Electric Company has been granted the privilege of furnishing electric illumination for the streets for a period of five years at a cost of 35 cents per light per night.

Cartersville, Ga.—This city will vote June 22 on bonds for \$10,000 to build the proposed electric light plant. F. M. Ford, mayor.

Chattanooga, Tenn.—The electric light plant here is soon to be sold, and it is quite probable that the city authorities will bid it in.

Fullerton, Neb.—Two applications have been filed with the city council for an electric light franchise, one by T. Lee and another by E. D. Gould.

Grand Rapids, Mich.—The M. B. Wheeler Company of this city has secured a contract to install the municipal electric lighting plant of Reading, Mich.

Hancock, Md.—This place may be lighted by power from the electric plant of Berkeley Springs, Va., which is six miles away.

Holden, Mo.—McMillan & Simpson have been granted a franchise for an electric light and heating plant.

Ipswich, Mass.—Ipswich is to establish an electric lighting plant at a cost of \$25,000.

Le Roy, N. Y.—Justice Childs has appointed John H. Ward, of Batavia, receiver of the Le Roy Gas & Electric Company, which is in financial difficulties.

Little Rock, Ark.—W. H. Wissig of St. Louis, Mo., will purchase the municipal electric light plant.

Madison, Fla.—The Madison Power Company has been granted the privilege of establishing and operating an electric light plant.

Murdock, Minn.—The citizens have voted to issue bonds for the purpose of erecting an electric light plant.

Orlando, Fla.—This city will vote June 22 on the proposition of J. M. Cheney and associates for the erection of an electric light plant of twenty-eight 2,000 candle power arc lights. If the plant is installed the Orlando Water & Light Company will be organized to operate it.

Paris, Ill.—The city council has about concluded to put in a new electric light plant.

Philadelphia, Pa.—C. Taylor Leland, 142 Chestnut street, is ready for bids for installing an electric plant for the Delaware City Light & Water Company, including dynamos, wire and poles.

Portage La Prairie, Man.—The town council is considering the question of erecting a municipal electric light plant.

Roanoke, Ala.—This city has sold bonds and will commence work about June 15 on the proposed \$25,000 waterworks and \$10,000 electric light plant. Z. J. Wright, mayor.

St. Michael's, Md.—A company is being organized in St. Michael's with \$10,000 capital stock to erect an electric light plant. O. Hammond, Glenn Building, Baltimore, is interested.

Union, N. J.—In the near future a large electric light plant is to be erected here.

Wichita, Kan.—The Wichita Gas, Electric Light & Power Company has decided to spend \$20,000 in improvements on its plant, and new machinery will be installed.

Street Railways.

Amsterdam, N. Y.—The directors of the Fonda, Johnstown & Gloversville Railroad Company have voted to extend its electric road, connecting with Fonda, Johnstown and Gloversville, from Johnstown to this place. Work of survey will be commenced at

once.—The directors of the Amsterdam Street Railroad Company have voted to extend its line from here to Schenectady, connecting with the Schenectady Electric Road. A survey will be made at once.

Aurora, Ill.—The Elgin, Aurora & Southern Traction Company of this place was lately incorporated for \$2,000,000 to operate street railroads, tramways and light, heat and power plants. L. J. Wolff, F. B. Bicknel, H. Greenebaum and others are the promoters.

Birmingham, Ala.—The Metropolitan Rapid Transit Railway Light & Power Company will build an electric power plant. E. F. Enslin, treasurer.

Bryan, O.—A franchise has been granted to Messrs. Cummins & Ramsey of Hillsdale, Mich., by the village council to operate an electric line through the corporation of Bryan. The proposed line is to run from here through Pioneer to Hillsdale. The right-of-way for this line has nearly all been secured.

Dover, Pa.—Right-of-way has been secured for a trolley line from Mechanicsburg, Cumberland County, to this place in York County, where connections will be made with the York and Dover trolley line.

Houston, Tex.—H. Baldwin Rice was recently appointed receiver of the Houston Electric Street Railway Company, and his bond was fixed at \$50,000.

Key Port, N. J.—The residents of this place feel assured that the trolley between here and Matawan will be built, and that this will be only one link in the trolley chain that will connect the metropolis and the Monmouth shore.

New Albany, Ind.—The promoters of the New Albany and Paoli electric line declare that the line will be built. It will be 40 miles long and the track is to be laid on the New Albany and Paoli turnpike.

New York City.—The old West End Road to Coney Island, which has been undergoing reconstruction for some time, will soon be completed. Part of the road has already been operated, but cars were not run to Coney Island. The Coney Island end of the road will be finished within two or three weeks. The motive power on this road will be electricity, thus making the third electric elevated road in the Brooklyn Rapid Transit system.

Omaha, Neb.—Plans for consolidation of the street railways of this city and Council Bluffs, the electric power plants of the two cities, and the Platte River Canal appear to be assuming a definite shape, and it is said the consolidation now hinges only on terms of purchase. The new combination will probably be capitalized at \$20,000,000.

Ottawa, Ont.—A scheme is on foot to build an electric railway from Buckingham up the Lievre River to the L'Original Rapids, 100 miles above Buckingham. The falls along the route will be used to furnish the motive power.

Plainwell, Mich.—H. Patterson, manager of the Grand Rapids, Allegan & Kalamazoo Traction Company, says that the electric road through Plainwell is a sure thing, and that everything will be completed by January 1 next.

Sharon, Pa.—The Youngstown-Sharon Street Railway Company has awarded the contract for all the steel rails to be used in the construction of the line between this city and Newcastle, a distance of 21 miles. It is the intention to expend about \$2,500,000 in Western Pennsylvania and Ohio on its new trolley system. The road, when completed, will connect Sharon and Cleveland.

Taylorville, Ill.—An electric line will be built from here to Mount Auburn. It will be known as the David M. Sharp line. Mr. Sharp says that the right-of-way has been secured between the two places, and that the Cleveland Construction Company, which is now building an electric road from Philadelphia to New York, has offered to construct the Mount Auburn line and accept pay in stock.

Titusville, Pa.—It is understood that the consolidation of the Meadville, Cambridge Springs, Venango and Titusville street railway companies is but the initial step to form a combine of all the trolley lines in Western Pennsylvania, and of those in Eastern Ohio. It is said that the consolidated lines will have a

capital of over \$3,000,000. The combined length of the roads is over 200 miles.

Woodbury, Pa.—A deal was lately consummated, by which the Gloucester & Salem Turnpike Company was merged into a trolley company, and a line is to be built from here to Swedesboro, and also connect with the Paulsboro Traction Company's line at Clarksboro.

Company Matters.

Albany, N. Y.—Certificates filed last week announce the merger of the Coxsackie Electric Light Company and the Athens Electric Light & Power Company with the Upper Hudson Electric Company. The capital of each is \$20,000.

Burlington, Vt.—At the recent annual meeting of the Vermont Electric Company the following officers were chosen: President, A. E. Richardson; vice-president, Edward A. Pope; secretary and treasurer, A. C. Whiting; manager, Walter S. Vincent. There was a large attendance of stockholders and the affairs of the company were found to be in excellent condition.

Concord, N. H.—The Concord Electric Company, formed to take over the property and business of the Concord Land & Water Power Company, filed articles of agreement a short time ago. The capital stock of the company is \$400,000, and the incorporators are: W. H. Whitney, Chas. H. Stone of Boston, Fred. C. Demond, Allen Hollis and Geo. L. Osgood of Concord.

Reading, Pa.—The Reading Electrical Construction Company reports a very busy season in electrical work.

South Milwaukee, Wis.—The Chicago Bronze Electric & Foundry Company has decided to remove its plant from Chicago to this place.

Power and Transmission.

Redlands, Cal.—H. H. Sinclair, president and general manager of the California Electric Power Company, is soon to take an Eastern trip, and upon his return work will be commenced on developing electricity in the Kern River, where the company has extensive and valuable water rights. Plant No. 1 will cost not less than \$2,000,000, and when completed it will conduct to Los Angeles 16,000 horse power. A second plant will be erected on a site already selected as soon as the market demands may justify. The company intends to supply electricity to not only Los Angeles, but to companies operating in many adjacent towns. The new enterprise will not lack for financial backing.

Richmond, Va.—The New York Trust Company will build and equip a power plant to furnish power for the Richmond & Petersburg Railway Company and power and light for this city. The undertaking will represent a cost of \$1,000,000.

Winnipeg, Man.—The question of utilizing Park Lake as a water power to operate the municipal electric light and telephone system is now occupying the attention of the town councilors and mayor. If this body of water can be used for this purpose it will considerably relieve the expense of operation.

Automobiles.

Baltimore, Md.—The Snow Deal Manufacturing Company of this city, with a capital of \$100,000, will manufacture bicycles and automobiles.

Carlisle, Pa.—The Pennsylvania Electric Vehicle Company of this city, capitalized at \$2,500,000, has lately been incorporated.

Harrisburg, Pa.—The Penn Auto Company was recently organized with a capital stock of \$5,000.

Riverhead, N. Y.—There is a possibility of a company locating here whose specialty is the manufacture of automobiles and electric launches.

Springfield, Mass.—The Springfield Automobile Company is now located at 60 Main street.

Troy, N. Y.—The Hidley Automobile Company is located here with a capital of \$50,000. Eugene Bryan J. B. Holmes and N. R. Holmes, all of this city, are the directors.

Toledo, O.—The Toledo Automobile Company has changed its name to the Toledo Motor Carriage Company.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by ELECTRICITY from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

* Unlisted. † Ex div.
 a The United Railways & Electric Company comprises in its organization the Baltimore Consolidated Railway Company, the Baltimore City Passenger Railway Company, all the lines of street railway operated by these companies, and also the Central Railway Co. of Baltimore. The pref. stock of U. R. & E. Co. has been issued in the form of income bonds.
 b Leased to Boston Elevated Railroad Company.
 c Owned by Brooklyn Rapid Transit Company.
 d Leased to Brooklyn Heights Railroad Co., which guarantees 10% on capital stock.
 e Stock owned by Brooklyn Rapid Transit Company; road operated by Brooklyn Hts. Co.
 f Stock owned by Kings County Traction Company; road leased to Nassau Electric R.R.
 g Owned by Atlantic Ave. R.R. and leased to Nassau Electric R.R.
 h \$30 per share on outstanding capital paid as rental by lessee—West Chicago St. R.R. Co.; \$200,000 of stock owned by North Chicago Street Railroad Company.
 i Controls by lease Chicago West Division Railway, Chicago Passenger Railway, and West Chicago Street Railroad Tunnel Company.
 j \$35 per annum paid on outstanding capital as rental by lessee—North Chicago Street Railroad Company; \$625,000 of stock owned by West Chicago Street Railroad Company.
 k Majority of stock owned by Chicago West Division Railway Company; 8 % on \$1,000,000 stock guaranteed by West Chicago Street Railway Company, lessee.
 l Cincinnati St. Railway purchased the Mt. A. & Eden Park road, assuming its bonds.

* Unlisted. † Full paid. ‡ Outstanding. § Ex-div.
 a Leased to New Orleans Traction Company at 6 % on stock.
 b Leased to New Orleans Traction Company at 8 % on stock.
 c Leased to Central Crostown Railroad at 8 % on stock and interest on bonds.
 d Operating the former Met. Trac. system, that corporation having become extinct.
 e Leased to 23d Street Ry. for 99 years; lease assigned to Metropolitan Street Ry.
 f Leased to Houston, West Street & Pavyonia Ferry—now Metropolitan Street Railway.
 g Leased to Metropolitan Street Ry. at 8 % on stock until Oct. 1, 1897; thereafter 9 %.
 h Leased to Metropolitan Street Ry. for 99 years from Jan. 1, 1893, at \$215,000 per annum.
 i Leased to Met. St. Ry. for 99 years from April 20, 1892; 6 % first 5 years, 8 % thereafter.
 j Leased to Metropolitan Street Railway for \$145,000 per annum.
 k Leased to Metropolitan Street Railway for 18 % on capital stock.
 l Controlled by Third Avenue Railroad by purchase.
 m Dividends of 1 1/4 % yearly guaranteed by Consolidated Traction Company.
 n Controls by lease the Allegheny, Cent., Citizens' Duquesne, Fort Pitt & Pitt's Traction.
 o Leased to Consolidated Traction Company for 8 % per annum on par value of stock.
 p Leased to Fort Pitt Traction Company for 6 % on \$5,000,000 capital stock.
 q Leased to Consolidated Traction Company for 4 % on capital stock.
 r Leased to Consolidated Traction Company for 7 % on capital stock.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 17@17½c.; Lake, 17½@17¾c.; casting, 16¾@17c.

The annual meeting of the Thomson-European Electric Welding Company will be held June 12 in Portland, Me.

The West Philadelphia Passenger Railway Company has declared a dividend of \$5 per share, payable July 1 to stock of record June 15.

The Commercial Cable Company has declared the regular quarterly dividend of 1¼ per cent., payable July 1. Books close June 20 and reopen July 2.

The Philadelphia "Stockholder" says the strength of General Electric is attributed to prospective rights in connection with the capital readjustment.

The Union Passenger Railway Company of Philadelphia has declared a dividend of \$4.75 per share, payable July 1 to stock of record June 15.

The Massachusetts Railroad Commissioners have authorized the Northampton and Amherst Street Railway Company to issue \$100,000 5 per cent. 20-year mortgage bonds.

Mr. F. B. H. Paine, a prominent official of the Westinghouse Electric Company, has been in Ottawa on business with Messrs. Ahearn & Soper, the Canadian agents of the company.

The directors of the Massachusetts Electric Companies have declared a dividend of \$2 per share on the preferred stock, payable July 1 to stock of record June 15.

The Philadelphia & Lehigh Valley Traction Company has filed a mortgage for \$2,500,000 to the Guaranty Trust Company to secure 4 per cent. bonds guaranteed by the Lehigh Valley Traction Company.

Governor Crane of Massachusetts on June 5, signed the bill permitting the Edison Electric Illuminating Company to purchase the Boston Electric Light Company through exchange of shares.

An official of the New England Vehicle and Transportation Company states that the Newport plant of the company has been sold to the New York Electric Vehicle and Transportation Company and not to private parties as announced.

The following are quotations for some of the industrial stocks not quoted elsewhere: Electrical Lead Reduction, 3½@4; Electric Boat, 23½@24; Electric Vehicle, 10½@11; Tel. & Tel. Company of America (full paid), 56@6¼; Electric Company of America, 8¼@8½; National Carbon, 15¼@16.

Advices from Nashville, Tenn., state that the Cumberland Telephone Company has decided to increase its stock 20 per cent. Stockholders have the right to subscribe to the amount of 20 per cent. of their holdings in new stock. This will increase the capitalization of the company to \$7,500,000. The new issue is for the purpose of building new lines and exchanges.

The Electric Street Railway Company of Kingston, Ont., has refused the demand of its employees, who are members of a union, for an increase in their wages. The company claims that the road is not a paying concern, and if the men go on strike the company will try to replace them with other men, and failing that, will run its cars into the barn and sell them and the whole plant by public auction.

The listing committee of the Boston Stock Exchange, has admitted to the list 36,000 shares, \$3,600,000, of the common stock of the Seattle Electric Company and 12,500 shares, \$1,250,000, of the preferred stock out of 50,000 shares of common and 12,500 shares of preferred authorized. The company was organized for the purpose of owning and operating electric railways, light, heat and power plants, etc.

It is said that Gov. Stone of Pennsylvania signed the rapid transit traction bills at midnight under date of June 8. Charters for four or five companies for Philadelphia under the names of the Northern, Eastern, Western and Southern Rapid Transit Companies with capitalization \$12,000,000 have already been asked for. Ordinances for franchising on every available street in Philadelphia are expected to be introduced in councils and passed this week.

The listing committee of the Boston Stock Exchange has taken from the unlisted department and placed on the regular list \$15,000,000 American Telephone and Telegraph Company collateral trust 4 per cent. bonds dated July 1, 1899, and due July 1, 1920. The following financial statement as of April 30 has been submitted by the company: Assets—Construction, equipment and supplies, \$16,398,952; telephones, patents, etc., \$4,903,689; stocks and bonds, \$75,306,150; real estate, \$1,633,213; bills and accounts receivable, \$5,769,884; cash and deposits, \$5,877,742; American Bell Telephone Company, \$22,110,400; total, \$131,917,030. Liabilities—Capital stock, \$94,237,500; bonds, \$15,006,000; profit and loss surplus, \$3,961,699; reserves, \$2,295,638; bills and accounts payable, \$445,982; contingent, \$15,970,210; total \$131,917,030.

The formal ratification is expected soon of the deal for a consolidation of the Philadelphia Company and the Consolidated Traction Company of Pittsburg. Stockholders of the Philadelphia Company will receive for each \$100 shares of common stock \$100 of collateral trust 5 per cent. bonds, \$20 of preferred stock and \$20 of common stock of the new company. This new company will issue \$40,000,000 of collateral trust 5 per cent. bonds. Of this, \$18,750,000 will be issued in partial exchange for the stock of the Philadelphia Company, \$12,000,000 in partial exchange for the Consolidated Traction stock and the balance held in reserve. There will be \$15,250,000 in 5 per cent. cumulative preferred stock, of which \$2,950,000 will be given in partial exchange for Philadelphia Company, \$9,000,000 in partial exchange for Consolidated Traction and \$2,400,000 in exchange for \$2,000,000 consolidated preferred stock. The common stock will be \$10,500,000 and of this \$2,950,000 goes to the Philadelphia company and \$7,550,000 to the Consolidated Traction. Each \$100 of Consolidated Traction common stock will receive \$50 in new preferred stock and \$50 in common. Consolidated preferred will get \$100 in the collateral 5s, \$20 in new preferred and \$3 a share in cash for accumulated dividends.

EDITORIAL NOTES.

The Independent Telephone Meeting.

The Buffalo meeting of the Independent Telephone Association, which recently drew to a close, was most successful and satisfactory in every way. The attendance was unusually large and what was more to the point the sessions of the Convention were well attended. The papers that were read were few in number but were almost without exception quite thoroughly discussed and the principal points brought forcibly to the attention of the delegates. Judge Thomas, who has already done so much for the Independent cause, was re-elected President of the Association, which augurs success for the coming year. That the Pan-American Exposition was visited goes without saying, and the Bell Telephone Company and other exhibits carefully inspected. The Bell Company has an unusually large exhibit of its most recent telephonic apparatus which enabled the Independents to form a very clear idea of what their rival is doing.

The proceedings of the Convention will be found on another page of this issue.

Some Wonderful Batteries.

The saying that "it never rains but it pours" would seem just at present to apply to the bringing out of new storage batteries. Several European inventors claim to have designed storage batteries that cannot be surpassed in the way of endurance, capacity, cheapness, etc. Mr. Edison hopes to revolutionize the electric industry with his new battery recently described in these columns, while now we hear of a telephone man who is credited with bringing out a battery, which it is claimed—by a daily paper—far surpasses even that of Mr. Edison. The newspaper article states that "Walter Scott Strowger, the inventor of the automatic telephone switch which gave rise to the automatic telephone exchange now in use in several localities, has just invented an electrical storage battery that he says beats anything of the kind ever offered by Edison and the other electrical experts. Mr. Strowger's battery can be charged to an amperage so tremendous in power that it would melt other storage batteries. He also has invented, to go with the battery, a substance to take the place

of the india-rubber casing, which is superior to rubber for the purpose, and is 90 per cent. cheaper and more desirable.

"It is sufficient in point of illustration as to the value of this invention to say that Mr. Strowger stands ready to take the Empire Express train from Rochester to New York by his battery and system of electric power over the New York Central Railroad. He says his battery takes only half an hour to charge. He has discovered a new gas, similar in illuminating power to acetylene, but without its dangerous qualities, which is made out of the simplest materials, the residue of which, when made on a large scale, is of more value than the gas itself, the proceeds from the sale of which will defray all the expenses of manufacture."

After reading the above most storage battery manufacturers might be tempted to sell out their business to the first bidder, but a moment's thought will probably convince them that there is really very little to apprehend in the way of competition from such "marvels," at least for a good while to come, if ever.

* * *

The Macquarie Lighthouse.

As we stated some time ago in these columns, electricity is being adopted but slowly by the leading nations of the world as a lighthouse illuminant. France, which boasts of something like a score of electric lighthouses, has probably more than all the other nations combined, although England has a few scattered along the rocky coasts of its possessions. In this connection a communication recently received from a resident of Sydney, N. S. W., is both timely and interesting. It seems that the whole of the New South Wales coast is efficiently lighted, and when the service passes into the hands of the Federal Government, further improvements will be effected. Some of the lights are visible at a distance of 12 miles. The most important of the New South Wales lighthouses is the Macquarie, at the entrance to Port Jackson, and which ranks as one of the largest and finest in the world. It is also the grandest example of electric lighting of which the southern hemisphere can boast. The structure was commenced on March 1, 1880, and the light in connection with it brought into operation on June 1, 1883. The old lighthouse, which the new one has replaced, was built in 1816, and was the first structure of the kind in Australia. It is equal-

ly interesting, and also illustrative of the enterprise of the State, that the electric light was first used for lighthouse purposes. The light is of the first order, sixteen-sided, dioptric, holophotal revolving white light, of the system of Fresnell, showing a flash of eight seconds in every minute, and having a range of 25 miles seaward. It is, however, discernible for a considerably greater distance, owing to the luminosity produced in the atmosphere by the electric beam before the direct rays become visible.

As in most modern electrically operated lighthouses the Macquarie is provided with a supplementary light of oil or gas to be used in clear weather or in case any part of the electrical machinery should get out of order.

With full power of the electric light at the focus the mean intensity of the flashes in the direction of the sea horizon is not less than five or six millions of candles. By a simple arrangement the change from gas light to electric light at the focus, or the reverse, can be effected in ten seconds, and the flames of the oil lamp can be substituted for the gas or electric light in nearly the same space of time. The Macquarie Lighthouse is intended only to illumine half the horizon; it is therefore possible to make use of the landward rays by means of a dioptric mirror. This was probably the first instance of the use of a dioptric mirror for an electric light. Special adjustment was needed to attain the result in a satisfactory manner. The whole apparatus is carried on a round pedestal, which offers the great advantage of enabling the keeper to enter without interfering with the rotation of the apparatus. Arrangements are made to burn either gas or paraffin oil, or to exhibit the electric light at full power or half power. When the electric light is in use there is always a second lamp in readiness for action. The practical result of the lighthouse, says our correspondent, has been to make the entrance to Sydney harbor perfectly safe, except during the most violent weather.

* * *

Export Trade Transportation Facilities.

A careful study of conditions in the commercial world to-day leads one to ask whether or not the export trade of the United States is controlled by one huge monopoly, and if so, are our Government officials cognizant of this fact, and to what extent are they aiders of the monopoly.

Scarcely a daily paper and not a single edition of the trade papers can be taken up in which will not be found some letter from a United States consul urging the importance of his particular locality as a possible and probable market for some line or lines of American manufactures. Should some enterprising manufacturer or exporter take up the matter, he is sure to find, as have many others before him, an open market, but a prohibitive freight rate.

As an example of this we might mention a manufacturer who desired, a short time since, to make a shipment of a small package to the Argentine Republic, the weight of which was three pounds. As there is no parcels post arrangement between the United States and the Argentine Republic, recourse must of necessity be had to the private express companies, with the result that the manufacturer was confronted with charges on this three pound package amounting to \$6.30, the value of the

package being perhaps in the neighborhood of \$3. It will readily be seen that that particular market was very effectually closed to this American manufacturer, unless some other means of transportation could be found.

Had this exporter, however, been an Englishman, and a resident of that country, the conditions would have been different, for he would have been able to send the same package by parcels post from England to the Argentine Republic at a total cost of 57 cents. And this is only one of thousands of instances which might be cited in connection with our export trade. It may not appear, at first glance, how effectual this barrier is, until we remember that all European manufacturing countries have parcels post treaties with the countries wherein lie the new markets for American products, thus placing the American manufacturer at the disadvantage of finding after he has landed his goods subject to the heavy transportation charges of the private express companies, that he is to be placed in competition with similar goods which have been brought from the European manufacturing centers at a reduced cost for transportation, and which can, therefore, be sold at a much lower price.

These matters are continually being brought to the attention of our officials who have charge of the making of such treaties, and who have the power to aid the American manufacturer if they will, and yet very little effort is being made to relieve the situation on the part of those who should have the American manufacturers most at heart. American exporters and manufacturers, and in fact every one who is in any way interested in the successful sale of American goods in foreign lands, should insist that our postal authorities open their eyes, which now seem to be so effectually closed, to all but the dollars for which they are working, when they refuse to aid the manufacturer and exporter of the United States by making parcels post treaties with those countries in which there are new and abundant markets for just the classes of articles which can be transported so satisfactorily by parcels post.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

W. J. CLARKE, the well-known wireless telegraphy inventor, has succeeded in transmitting pictures by wireless telegraphy a distance of 15 feet and through an eight-inch brick wall.

THE second annual meeting of the Roentgen Society of the United States will take place in Buffalo, N. Y., September 10 and 11, at the University of Buffalo.

THE Crocker-Wheeler Company at Ampere, N. J., has reduced the force of State detectives that has been guarding the works against the strikers for several weeks to one man by day and three or four at night. The night shift is well established and work is proceeding as rapidly as if nothing had happened to disturb it.

THE Emperor of Austria has made Dr. Karl Auer von Welsbach a baron in recognition of his numerous valuable inventions. Dr. Welsbach is best known in connection with the incandescent light which bears his name, but it

is said that he is now seeking to do for electricity what he has already accomplished in respect of gas.

THE twentieth annual meeting of the Association of Railway Telegraph Superintendents will be held at Buffalo on June 19, 20 and 21.

CONSUL LISTON, of Rotterdam, according to the Bureau of Foreign Commerce, says that American machinery, on account of its excellent quality and finish, is rapidly gaining a foothold in the Netherlands, and that electrical appliances and hardware are meeting strong competition in cheaper articles from Germany.

It is quite evident that electricity is being used extensively in California. Not only are there many plans for the building of trolley lines out of Los Angeles to suburban towns, but San Bernardino and Redlands now come to the front with a project for an extensive system which will connect a number of towns in that section, the electricity to be supplied from the plants being built in the San Bernardino Mountains for the generation of electricity with water power.

A DEMONSTRATION has just taken place on the Palatinate (Bavaria) railways of a means of communication between suburban localities and the stations at which the express train stops, says the "Electrician," London. The first two trial sections were between Ludwigshaven and Neustadt (30 km.), and between Ludwigshaven and Worms (22 km.). The system of traction in use is the storage battery method, there being four long coaches, each of which can travel separately or combined in a train, with trailer cars when necessary. The weight of each car, with a full complement of passengers, is 53 tons, of which 15 tons represent the weight of the storage batteries. The normal speed of the cars is 45 km. per hour, and 24 journeys are accomplished daily over a distance of 440 km. In addition to the above mentioned lines, the cars are employed on other routes. It is understood that this feeder service, which has been found to work out at a less operating expense per car mile than if steam locomotives had been employed, has stimulated the traffic to and from the suburban stations.

THE Port Talbot Steel and Iron Company in England, so it is reported by an exchange, is erecting a new steel rolling mill, and as this will be the most modern in that country and probably the first new mill in which a complete equipment of electrically-driven machinery has been adopted, a short description of the plans may be of interest. The installation consists of a compound horizontal engine capable of developing 600 hp., with a steam pressure of 150 lbs. per square inch, driving on to a pair of generators, each being capable of giving an output of 200 kw., or collectively 400 kw., equal to 540 electrical horse power at the terminals. The current is utilized for working a 60-ton crane for the casting pit, this crane being fitted with four electric motors, i. e., one motor for heavy lifts, one motor for low lifts and for tilting the ladle, one motor for longitudinal traverse, and one motor for cross traverse. Over the casting pit a 10-ton crane of the three motor electric type is being fitted dealing with the ingots and bringing them to the rolling mills.

A MONOGRAPH on forest extension in the middle West, just issued by the Agricultural Department, contains some interesting information about telegraph, telephone, and electric power and light poles. The timbers most used for these purposes are tamarack, white cedar and red juniper. Their value is fully known, and if the supply could hold out nothing would displace them. Their life in the ground is about ten years, so that every decade sees one generation of poles worn out and another cut to replace it. To the poles required for renewal is to be added the number required for new lines and systems. The total is very large. The telegraph lines of the country require nearly 600,000 poles annually, at a cost of not less than a million dollars, and the telephone and electric car lines and light systems use as many more.

THE French automobilists, M. Charron and M. Henri Fournier, say they have decided to cross the Atlantic for the Buffalo-Erie race. M. Fournier will have the Mors machine with which he recently won the Paris-Bordeaux contest. M. Charron is going to have a new one built as soon as he knows the character of the roads. M. Charron, "le Roi des Chasseurs," says he is coming over on racing and business.

A NUMBER of contracts have lately been let in Colorado, among them are—to electrify the National Refrigerating Company's plant at Canon City; to put in an entirely new apparatus for the Hamson Creek lead mines at Lake City; to equip the Seaton Mountain Electric Company of Idaho Springs with three generators and a rejuvenated plant generally; to furnish electrical propaganda for the Colorado and Southern in its Alpine coal mines. The National Refrigerating Company will probably equip its Colorado Springs ice plant with electrical machinery. This plant freezes 300 tons a day, and the Canon City plant has a capacity of 200 tons daily.

THE first spadeful of earth in the Bronx excavation of the Rapid Transit was turned June 13. President Haffen, of the borough; John McDonald, the contractor; Chief Engineer Parsons, of the Commission, and Councilman Hottenroth helped the ceremonies by attending. Mr. Haffen declared that the work would be done in six months less than contract time.

YESTERDAY and to-day the annual convention of the Pacific Coast Electric Transmission Association met at San Jose, Cal. Street and electric light and power men from all over the Coast are present. A special feature of the meeting is experiments with the long-distance current of the Standard Electric Company, whose wire is 184 miles long, from the North Yuba River, in the Sierra Nevada Mountains. Recently a current of 60,000 volts was sent over the wire as a test. The company is now prepared to send regularly a current of 40,000 volts.

MR. W. O. WOOD, in a paper read before the North of England Institute of Mining and Mechanical Engineers on April 13th, deals for the most part with the Sussmann lamp, which he has used at the Murton Collieries since 1897, 1,000 lamps now being in daily use. The lamp is now made with battery weighs 3½ lbs. and has a capacity of 5½ ampere hours at 2 volts, maintaining the lamp for 8 to 10 hours with one charge. The life of the battery has averaged 10 months.

The Independent Telephone Convention.

One of the Largest Meetings Ever Held by the Association—Several Valuable Papers Read—Bell Methods Denounced—Judge Thomas Re-elected President.

The Independent Telephone men left Buffalo last week well pleased with the result of their Convention—which was the largest attended of any Convention yet held by the Association.

The meetings were held in Convention Hall, and the first day's session (June 11) brought together a large assemblage of delegates, who were called to order by the President, Judge J. M. Thomas. He introduced Mayor Diehl, who made a brief address, saying that he welcomed the Independent telephone men because they represented a principle of vast importance in all industries, namely, "competition is the life of trade."

The President's Address.

Judge Thomas, in his Presidential address, reviewed the work of the Independent Association since the organization was started. He said:

"The past year has been one fraught with important events in the telephone world, and the great work that has been accomplished is the highest commendation that can be offered to the great army of workers in the field. Having been in close touch with all the great independent organizations of the country and knowing their present status, I do not hesitate to say that all doubt of the permanency of the Independent telephone movement has passed. Doubters have become its advocates, while the voice of the false prophet is no longer heard in the land, and his writings have been placed in the archives of oblivion bearing the inscription above its portals, 'Failure.'"

"The work in the Middle West, North and South, the greatest fields of activity in telephone development, is to be followed by very active development in the extreme Eastern and Western sections of the United States, and in a short time the organizations, now nearing perfection in these sections, will show a development that will be highly gratifying to those of us who for several years have labored in the fields now more fully developed."

"In speaking of the conventions held by this organization I have heard several gentlemen who have attended them say that the general tone resembles more political conventions than conventions of allied business interests. I have always agreed with that statement with a limitation that they have been somewhat like political conventions would be with the politics eliminated. Like public conventions we have never lost sight of the principles of progress and fair dealing with the people, and being so different from meetings of the men who control the Bell Companies, this impression has found lodgment in some minds. But this spirit, being the surest sign of the fundamental principles of progress, we desire that it shall always be the keynote of all conventions of the organization."

"There has been much inquiry, not only on the part of those who have control of this field

of investment, but also by those desiring to enter, as to the underlying principles that actuate the development of this movement. To fully and properly answer that inquiry requires a careful study of the entire history of telephony and would require more time than those of us who are actually engaged in construction and operation have been able to give to the subject; but a glance over certain events and certain policies will be of interest and profit to persons seeking the knowledge desired by the prudent man before investing in the building of telephone properties."

Judge Thomas then gave a brief history of the telephone and the several patents obtained, paying a tribute of praise to Mr. Edward P. Payson, of Boston, the attorney, and his assistants, "who defeated the skill and cunning of those who were employed to try to deceive our patent officials and courts." In concluding his address, the President said:

"This combined effort has resulted in the decision of Judge Brown, in which he holds: First, that at the date of the application, June 4, 1877, Berliner had not made the invention covered by the patent issued to the American Bell Telephone Company on November 17, 1891. Second, that the invention designated in the patent is radically different from the invention described in the application. Third, that the invention was previously patented by Berliner. Fourth, that Edison was the prior inventor. Judge Brown agrees with the well-known position of all telephone inventors that Berliner, so far as his claim to a microphone is concerned, invented nothing."

"These facts, together with the policy of the Bell companies in dealing with the people, has been the chief incentive to invest in this field. The people were anxious for relief from their arbitrary methods, and have always welcomed an independent company."

"Having proven our legal right to give telephone service by good and efficient methods, and having demonstrated our ability to compete with the old companies, it becomes now a question of working together for one common end, and it is important that at this meeting we consider such questions as will lead us to unity of action. The present year will add much to our present strength by placing a large amount of money at our disposal."

At the close of the address the meeting then adjourned until 10 A. M. Wednesday.

WEDNESDAY'S SESSION.

The Convention was called to order at 10 o'clock, and Hon. S. P. Sheerin, of the New Long Distance Telephone Company of Indianapolis, read a paper on "Village Exchanges and Farmers' Lines." He referred as follows to the growth of the Independent movement in his own State:

"When the first Independent telephone exchange was constructed in Indiana, my State, the Central Union Telephone Company had been paying, for 12 years, on a capital of \$6,300,000 (three-fifths of which was pure water) annual dividends, ranging from 4 to 6 per cent. They had no bonded indebtedness and no floating indebtedness, that was reported. When the fight with the Independents began they ceased paying dividends—the last one being paid in 1895. In 1897 they borrowed \$2,500,000; in 1899 they borrowed \$6,000,000—two and a half of which was set aside to pay the holders of the first mortgage of two and a half millions. They now have, in addition to this \$6,000,000 mortgage (according to recent publi-

cations), a floating indebtedness of \$1,250,000. Now, let me tell you what all this has resulted in. The Central Union now has (as shown by their own figures) 22,000 telephones in the State. The real number is smaller than this but we can afford to be generous. and I propose to give them all they claim. The Independent telephone interest have, in the State of Indiana, by actual count, 52,469 telephones. I know you will excuse me if I repeat those figures. After a 'war expenditure' of \$7,250,000, begun upon the Independent movement when there were less than 3,000 Independent telephones in the State, the Central Union now has, for its expenditure, 22,000 telephones and the Independent movement has 52,469."

Mr. J. B. Ware of the People's Telephone Company, Detroit, discussed Mr. Sheerin's paper and claimed that the Independents were now giving much better service than the standard achieved by their old rivals. Even the apparatus was now generally superior.

Mr. Charles E. Wilson, of the Keystone Company of Philadelphia, apologized for not preparing a paper on "Independent Telephone Development East of the Alleghanies," saying that work on his new exchange demanded all his time. He, however, invited the Convention to meet in Philadelphia next year, and pledged the delegates a grand reception.

Senator C. W. Kline, of Hazleton, Pa., president of the Interstate Telephone & Telegraph Company of Pennsylvania, then read a brief paper on the subject assigned to Mr. Wilson. Mr. Kline said that under the management of Mr. S. E. Wayland, plants had been installed in Scranton and Wilkes-Barre, covering the Lackawanna and Wyoming Valleys, with an easy possibility of 30,000 telephones in sight, and 7,000 now at work. Allentown has a splendid system, with a possibility of 5,000 telephones, with about 1,800 installed. Reading is being built. Easton is working up the lower Lehigh. The Overland of Lehigh reaches out its tentacles for everything in sight. The Anthracite of Hazleton, embraces everything in lower Luzerne, Upper Carbon and Northern Schuylkill Counties. The Standard of Bucks and Montgomery is now being rebuilt by Mr. G. S. W. Brubaker, covering all that section. The United Telephone Companies embrace Norristown, West Chester, Lancaster, Lebanon, all of the Schuylkill, Northumberland, Montour and Columbia Counties, and the north and west branches of the Susquehanna. Harrisburg is building also Columbia. York connected with Carlisle via Chambersboro is extending its lines in every direction in York and Lancaster Counties, and is connected west to the Alleghanies. As to New York State, he remarked that fine plants had been installed at Rochester and Albany. The United Telephone Company of Pennsylvania covered the southern portion of New York State. The Maryland Telephone & Telegraph Company had a splendid plant at Baltimore, and the chain of independent companies stretched south along the Atlantic to the Gulf of Mexico. He predicted that in a very short time the Independents would have in the territory east of the Alleghanies more telephones than the Bell would have in the same State both east and west of that range.

Mr. C. E. Stinson, of the Rochester, N. Y., Telephone Company, followed Senator Kline, and gave with considerable detail an account of the systems in Rochester. They have at present some 3,600 in service in a population of

160,000. The Bell people claim 2,200. He had about 160 miles of pole line, and had everything covered within a radius of eight miles of Rochester. With them, farmers' lines were different from what they had been hearing about, and brought \$40 to \$50, five-year contracts, payable quarterly in advance. Mr. Stinson closed by inviting the Association to visit Rochester.

So much time was spent by the speakers that the Convention concluded to hold no afternoon session and adjourned until Thursday morning, the Association in a body visiting Niagara Falls in the afternoon.

THURSDAY'S SESSION.

President Thomas called the Convention to order at 10 o'clock, and announced the reading of a paper by Mr. L. W. Stanton, switchboard manager of the Cuyahoga Telephone Company, Cleveland, on "Exchange Service," accompanied by a number of load diagrams. Mr. Stanton divided his subject into three important branches—reliability, promptness, good transmission. Any of these, if not up to its highest state of perfection, mars the general result.

Mr. Stanton's paper was quite lengthy and replete with good suggestions, one of which was as follows: "The telephone business stands to-day on a higher plane than ever before. The Independent movement has forced the Bell Company to put forth their best efforts, and this in turn has stimulated the Independent companies, but telephony is yet far from its ideal goal. Look through the operating rooms of some of the large Bell and Independent companies and notice the number of idle operators, while on the same boards there are operators that have more calls than they can properly handle. Few telephone men seem to have realized the importance of equalizing the load among the operators, that is, placing enough lines in front of each operator to properly load each position."

The next paper on the programme was read by Hon. E. B. Fisher, of the Citizens' Telephone Company of Grand Rapids, Mich., on the subject of "Bell Methods." Mr. Fisher's paper scored many points against the Bell management. He said:

"A large number of the brightest men in telephony have found employment in the independent field, and there is scarcely one in this Convention Hall who has not had frequent opportunity to secure many more of the most important employees of the Bell Company than he has had places for. We have been surprised at times at the seeming lack of loyalty to their employers by those who have been so long on Bell pay-rolls. Perhaps a little analysis of Bell methods may explain this situation and furnish a warning for ourselves. The rewards among the employees of the Bell heretofore have not been great either in salary or opportunities. They have been made to feel more like machines than human beings. In many cases they have not had their inventive tendencies encouraged by proper compensation for what they produced; indeed, they have been compelled to part with their inventions on the theory that their brains as well as their labor belonged to their employer, or because there was but one market for their invention and devices. That market could set its own price upon what it bought. Such conditions are not conducive to loyalty, or to inducing energetic service. The Independents, if they shall copy Bell methods in this respect, will

make a grievous mistake. If you should wake up some fine morning and hear that you have sold, or are about to sell, your telephone plant to the Bell Company do not consider that the transaction is necessarily closed. If you hear similar reports as to actual or impending sales of other Independent companies in your own or other States, be not disturbed thereat, nor convinced that the news is reliable. There have been some such sales, but vastly more rumors of those which never have occurred and do not seem likely to. There have been methods in these rumors. For some reason, some interest, evidently not Independent, has believed it desirable to circulate such reports, probably in the hope that other Independent interests might be disquieted or discouraged, and yield more readily to apparently advantageous offers. These methods have been relied upon to produce serious effects. Keep yourself and your neighbors advised of the strength and growth of the Independent movement, of the strength of their own situation in competition, and fewer such rumors will be verified hereafter."

A request was read by the Secretary from the president of the Business Men's Central Council of Buffalo asking for particulars as to the cost of equipping an up-to-date exchange.

Senator Kline referred to the able work performed in Washington by Judge Thomas and called for a rising vote of thanks to the President. Of course every delegate was on his feet when the question was put.

Mr. H. D. Critchfield delivered an address on "Legislation and Litigation," and then offered the following resolutions, which were unanimously adopted:

Resolved, by the Independent Telephone Association of the United States, in Convention assembled at Buffalo, N. Y., June 11, 12 and 13, 1901, that the thanks of this Association and of all persons who are interested in the welfare of the Independent telephone movement of the United States, is due to the officers of this Association for their faithful, intelligent and untiring efforts to promote the welfare of Independent telephony; and be it further

Resolved, That thanks are especially due to Hon. R. S. Taylor, E. P. Payson, and others enthusiastically associated for the work done in the litigation recently decided by Judge Brown in the United States District Court for the Northern District of Massachusetts, involving the validity of the so-called Berliner patent, and that successful conduct of this litigation is fully appreciated by this Convention. Be it further

Resolved, That the Secretary be and is hereby instructed to prepare and forward to the persons herein named copies of this resolution.

Invitations to hold the next Convention at Philadelphia, Rochester, Milwaukee, Mansfield and Louisville were referred to the advisory board.

Mr. Young (in the chair) appointed a committee of three to select a ticket for the ensuing year. The following ticket was reported and enthusiastically endorsed by the convention:

President—J. M. Thomas, Chillicothe, O.
First Vice-President—H. C. Young, Columbia, Pa.

Second Vice-President—C. E. Stinson, Rochester, N. Y.

Third Vice-President—W. H. Durin, Cedar Rapids, Ia.

Secretary and Treasurer—S. P. Sheerin, Indianapolis.

First Assistant Secretary—J. B. Ware, Detroit.

Second Assistant Secretary—C. E. Wilson, Philadelphia.

Third Assistant Secretary—J. B. Lee, Pittsburgh.

The Auditing Committee—Messrs. Black, Ware and Kline—reported finding the accounts of the Association in satisfactory shape.

The Convention then adjourned.

A COMPARISON OF THE BELL AND INDEPENDENT SYSTEMS AND METHODS OF OPERATION.

BY R. MAX EATON.

From a disinterested standpoint a comparison of the Bell and Independent systems and methods of operation might bring out points which are possibly overlooked by those whose minds are entirely enveloped by the interests at stake on either side, or who may permit themselves to be influenced to a degree by party prejudices. It is to a certain extent a characteristic of human nature to magnify the mistakes of the enemy and to reserve an expression of commendation of the points of virtue so much so as to sometimes overlook entirely valuable points of advantage.

The Bell through years of experience should and certainly has gained a great amount of valuable information relative to apparatus, systems and methods of operation and has almost reached the point of establishing a natural monopoly. Exception will at once be taken to this latter assertion, but let us look further into the matter. The Bell is now placing the very latest apparatus and systems in the larger cities, discarding in some instances boards and instruments which have been installed only a couple of years, and developing its long distance and toll line service to the highest state of efficiency and ignoring almost entirely towns and country places. The reason of this is that it has long since learned the fact that the great profits of the business is in the large cities and comparatively little revenue is derived from small isolated country exchanges other than long distance work. Thus we see in the smaller towns and cities Independent exchanges springing up opposing the Bell systems and meeting with no vigorous defense from them. In these small places we see the Independent companies installing a great many more instruments than the Bell attempts to secure, and operating good up-to-date systems, whereas we find the Bell operating in a great many cases the old Blake transmitters on ground lines and with antiquated types of boards. We cannot help but note, however, that in all these instances the Bell has put forth an effort to bring its toll conditions to a high degree of efficiency.

The question then arises, why does not the Bell put forth a greater effort of defense for the local work by improving the systems, increasing the subscribers and lowering the subscription rates to meet the Independent? It is simply that the spoil is not worth the battle. The cost of maintenance is so high and the yearly subscription so low that the profits on local work are not by any means an item for consideration. In these places the Independent companies are operating at a profit that would be impossible for the Bell to derive.

In the small places the systems most generally used by the Independents are very much superior to the Bell and as a rule give considerably better local satisfaction. The engineering problems in these cases fail to enter at all into the situation and do not become a matter for consideration to any degree.

In the larger centers of population, however, the scene is very much changed, and we find the Bell putting forth every effort to firmly establish itself, not so much now on the lines of a monopoly, however, as on the principle of

an indispensable industry. It is placing the latest equipments at considerable expense, putting in the very best construction, placing instruments which may probably be equalled but are unsurpassed, and are using every endeavor to secure extended contracts with railroad companies, express companies and large industrial establishments, perfecting the toll systems and using every power at its disposal to fortify against intrusion. This is being done probably to a great extent because the day of valuable unexpired patents is past and that cannot now be held before the capitalist as an intimidation.

The Independent companies have not yet to any extent opposed the Bell in the large cities, although just now we see on every side signs of this being started, and in fact in some large cities there are already individual exchanges. Their metal has not, as we said before, been tested by the establishing and operation of small exchanges, but now we will see as they attack the Bell's most modern systems, varied experience, perfected apparatus and established operative facilities, the brains of the very best engineers pitted against each other and the executive abilities of the managers and financiers struggling for supremacy.

The Independents have to face the fact that the Bell has an established industry, long contracts, perfected systems, the cost of maintenance reduced to the lowest possible point, perfected, trained, and organized systems of operation, maintenance and equipment and an organization complete for grasping at once the loopholes of advantage. In its toll work its equipment is uniform, and regardless of where you wish to talk over its long distance lines there is the advantage of both ends of the line having equally efficient equipment.

In opposing all these conceded points let us see in what manner the Independent companies propose to attack and whereby they expect to secure the larger or even a proportional share of the business. In the first place they have at their disposal some excellent systems, which none, however, will dare say contain enough points of superiority over the Bell to ensure success alone on that standpoint. The point might be raised that the Independent can give a great deal cheaper rates on account of the royalty drain of the Bell, but do we suppose in a battle for supremacy that would be allowed to stand in the way? Have we not however gotten the public who have been oppressed for years by high rates as the friend of the Independent? The public have no friends where the pocket is concerned and the ills of the past are soon forgotten in the whirl of business. Have the Independents a chance in long distance work where every town and city is equipped with different apparatus even if a sufficient trunk system is constructed or secured? It cannot be possible that the Independents are saying to the Bell, "We know more before we start than you have learned in twenty years," and is the Bell laughing in its sleeves and saying, "Wait and see; you have not commenced to enter the realm of telephony until you have tried to operate twenty-five or fifty thousand subscribers in a large city."

If the Bell can control the large industrial centers then the profits of the country places worth securing are in its grasp. Are we led to believe then that the Independents propose attacking the Bell on their own battle-field, with no other weapon than cheaper rates to secure

the supremacy? It would appear then like a tremendous undertaking because the public will not be burdened for a great length of time with two telephones, and it will evolve finally to a question of endurance during which time none will be benefited.

Let us do then as the general did when his army faced an almost insurmountable barrier, see if there is not another way around. Are we to believe that the attack is to be made on stereotyped lines or that the possibilities of the telephone have been reached and can be extended only on the same lines and within the same scope of usefulness as now presented?

In no place is the percentage of subscribers greater than 5 per cent. of the total homes of a city, and in very few instances has that been reached, and because it is impossible to operate and maintain a system which will come within the financial reach of the remaining 95 per cent. Then we are to believe that because a telephone system cannot be operated and maintained at a less cost than \$1.50 per station per month that the 95 per cent. must remain without the advantages offered by it. Would this 95 per cent. have any use for a telephone anyway? It would if it would supply their wants. In the present capacity of its uses it would be more ornamental than beneficial. The telephone in its present capacity must exist because it has now become an indispensable industry, but it can be extended to the remaining 95 per cent., not, however, as we see it now, but as a more useful and less expensive convenience. Why should a subscriber have to pay for a telephone at all directly? Would not any enterprising firm place a 'phone in a home if by so doing the trade of that home could be secured to them. The individual wants of any home of the 95 per cent. are common to all and why not be supplied from a common source? If I have a telephone in my home why should I have to communicate any farther than a central point to secure practically anything I require? Why not a business exchange instead of a telephone exchange? If I have a telephone why cannot I use it to order provisions, receive and transmit messages, secure information, call physicians, get stock quotations, request tradesmen, and the hundreds of other common necessities without having to go farther than the central? Why should I have to call any one else than central to secure any of the necessities which are common to all? To accomplish this then central will only require to be a business exchange instead of a telephone exchange. We do not wish to say that an exchange of this description would at all replace the telephone as we know it to-day, but in combination with it would develop a means of now getting over all the difficulties, heretofore encountered in placing the convenience of the telephone at the disposal of all homes.

Then would not any company gladly place the telephone in any home in a town or city, if by so doing it could centralize and control the trade? Would it not also be an advantage for the home to be in instantaneous and direct communication with the supply center? The telegraph companies now place call boxes free of charge, for the sake of securing only the telegraph business, which, when compared with the other, dwindles into insignificance.

Also this same telephone, while not used for business, should supply the home with entertainment, music, Sunday sermons, etc. When prominent men speak in a town or city any-

one should be able to sit in their own home and hear it.

When such a system is placed before the public then the scope of the telephone will just have commenced and the connections will be placed in houses as a matter of course, the same as water and gas, and it will become a fixed and indispensable part of every household.

This is by no means an electrical improbability, but as far as that is concerned is a demonstrative possibility.

The telephone problem will eventually be solved on some such lines as this, and then will the monopolies as we now know them meet their Waterloo.

EQUIVALENT EVAPORATION.

BY W. H. WAKEMAN.

This term is used much in engineering practice, and as it refers to a most interesting part of the calculations that a competent engineer must understand, a short article on the subject will help about making plain a matter that appears complicated to some men in charge of steam plants. The last word in the title means the process of "converting water into steam in a closed boiler," when used in this connection, and the first word means "an equal amount," therefore the complete title refers to the process of comparing the amount of water evaporated under stated conditions with the amount that is evaporated by the application of a given amount of heat, applied under conditions that have become a standard on account of their adoption by eminent engineers for this purpose. Heat can be measured, bought and sold the same as any other commodity, and the unit of measurement for this purpose is very properly called the "heat unit." It means the quantity of heat that is required to raise the temperature of one pound of pure water from 39° Fah. to 40°, or in other words to raise one pound one degree.

The amount required to raise it say from 200° to 201° varies slightly from the above, but inasmuch as the difference is so small it is customary to call it the same for all temperatures, and the error is unworthy of consideration, while the process is very much simplified by so doing. If a boiler is carrying 70 pounds pressure by the gauge, and the feed water is supplied at 100° Fah., the amount of heat required to evaporate one pound of it is found by subtracting the temperature of the feed water from the total heat of the steam.

The total heat is 1,210 heat units and the temperature is 100° Fah., or in other words, one pound of the steam contains 1,210 heat units, and one pound of the water 100 heat units. Then $1,210 - 100 = 1,110$ heat units. When an engineer is using a table of the properties of saturated steam for the purpose of making calculations in equivalent evaporation, he should note whether the pressures given are absolute or above the atmosphere; also whether the total heat is above zero or above 32°. To illustrate this point take a table in which the pressures are absolute. If the boiler pressure is 70 pounds, it is necessary to add 15 to it and look for 85 pounds in the table. If the total heat, or the heat units, are given above 32°, it will not answer to subtract the temperature of the feed water from this total heat as given, because the tem-

perature of the feed water is reckoned from zero, therefore 32 must be added to the total heat.

The above-mentioned conditions are a standard with which all others may be compared, and in order to make the process plain, an example will be worked out in full.

Suppose that during a test lasting ten hours, 6,720 pounds of coal were burned, or 672 pounds per hour, and nine pounds of water were evaporated by each pound of coal, making 6,048 pounds of water evaporated. The steam pressure was 120 pounds by the gauge, and the feed water was heated to 212° by exhaust steam. Under these conditions it requires 1,008 heat units to evaporate each pound of water, or 6,096,384 heat units for 6,048 pounds. As it requires 1,110 to evaporate each pound under standard conditions, we must divide by this number in order to determine the equivalent of it in the standard given us. $6,096,384 \div 1,110 = 5,492$ pounds, therefore the evaporation of 6,048 pounds under actual conditions is equal to evaporating 5,492 pounds under standard conditions. As the latter is less than the former let us note what causes the difference. 6,096,384 heat units were used and if we divide this amount by the number of heat units required for one pound under standard conditions we get a smaller number than when we divide it by the number required under the actual conditions, because the former is greater than the latter.

A problem in equivalent evaporation may be solved by using what is called the "factor of evaporation." This is determined by dividing the number of heat units required to evaporate one pound of water under actual conditions by the number required under standard conditions. In this case it is $1,008 \div 1,110 = .9081$. The pounds of water actually evaporated must be multiplied by this factor to get the equivalent evaporation, and in this case it is $6,048 \times .9081 = 5,492$ pounds as before. The evaporation of 30 pounds of water under standard conditions constitutes 1 hp., therefore if we wish to determine the power developed by this boiler we have $5,492 \div 30 = 183$ hp.

There is another standard which is given us for calculating equivalent evaporation, and when it is used for determining the horse power actually developed by a boiler, the results are practically the same as before. This standard refers to the number of heat units required to evaporate one pound of water at 212° into steam at atmospheric pressure, the total heat of which is 1,178 heat units, therefore it requires $1,178 - 212 = 966$ heat units to evaporate one pound of it.

The factor of evaporation is found by dividing the heat units required under actual conditions by 966. In this example it is $1,008 \div 966 = 1.0435$; 6,048 pounds of water were actually evaporated, and $6,048 \times 1.0435 = 6,311$ pounds on a basis equal to this standard.

It requires 34.5 pounds of water evaporated to constitute 1 hp. when this standard is used, and $6,311 \div 34.5 = 182.36$ hp. In these calculations the fractions have been omitted as this makes the matter more simple and affects the results but slightly.

An application of the principles herein laid down will enable an engineer to determine the power actually developed by any boiler, when the pounds of water evaporated, the temperature of the feed water, and the steam pressure are known.

BATTERIES USED IN TELEPHONY.

BY P. KERR HIGGINS.

(Concluded from page 366.)

In measuring internal resistance of a cell it is best to use the current from the cell under test, through a known resistance, then measure the EMF. at the electrodes with a voltmeter while the current is flowing, and again with circuit open and no current flowing. The difference in volts will indicate the drop in potential due to the flowing of the current against the internal resistance of the cell; which can again be found

by applying Ohm's Law: $c = \frac{\text{EMF.}}{R}$ and R (of cell) $= \frac{E}{c}$ (difference in volts between the two tests) divided by the current (c).

Storage batteries, or more correctly accumulators, may be defined as a combination of elements, so arranged and charged as to form an electric source of supply; like primary cells they depend on chemical action for their operation. So far we have treated primary cells only, or those using liquid depolarizers; those now under consideration, using oxides of lead, commonly known as litharge peroxide of lead (PbO_2), or minimum (Pb_3O_4), come under the class of secondary cells or accumulators.

There is very little difference between the primary and the secondary cell, the principal one being, that when exhausted, the latter can be restored by passing a current through it from another source of supply. In their normal state, the elements of an accumulator are non-electric, but when a current has been passed through them in a given direction, they are ready for service and perform the functions of a primary cell, and in their construction this end is constantly kept in view.

It should be remembered that the current charging the cells must always be in the opposite direction to that coming from the charged cell; therefore during charging the plate at which the current enters is termed the positive (+), and for technical reasons (one of which is that the potential of this plate is always highest) this plate is termed, at all times, the positive plate.

The form of accumulator most generally in use is that having lead for the foundation of both plates, and these are separated from each other by hollow glass tubes running the whole length of the plates. Many forms of plates are used, but the one which I have found to give the best satisfaction is one in which zinc chloride and lead chloride is melted and run into small molds which have a bevel edge; these are pressed into a second mold and an alloy of lead and antimony forced between the pellets; this is then passed through a third process, dissolving the zinc, and leaving practically a solid lead plate filled with plugs; these are used for the negative plates and a plain plate is used for the positive. The current being sent through, forms the porous part of the lead plates into peroxide, and the cell is ready for use. These are almost exclusively used in common battery systems, because of their low internal resistance, .002 ohm, and their uniform discharge, enabling us to maintain a comparatively uniform EMF. at the subscriber's station at all times, thereby maintaining a uniform service and saving the expense of maintenance of batteries at distant points. They are also very easily restored when run down, and when properly installed and cared for, only the

initial cost need be taken into account, as nothing more needs to be added but distilled water and very rarely a little dilute sulphuric acid.

The action which takes place in an accumulator is, on passing a current through, the water is decomposed, oxygen combines with the positive plate, producing a current in an opposite direction to that applied. Repeated applications of the current increases the surface of the positive plate, both plates becoming more or less soft and porous, especially on the surface, and are liable to injury if not carefully handled. This process is termed forming and is very slow. In order to hasten this forming process litharge is spread or applied in some special manner to the surface of the plates, so that, on applying the current, it is turned into peroxide on the negative and spongy lead on the positive. In many cases this is forced into holes in the plate under hydraulic pressure, as already stated, and gives good results, or is cast into grids and lattice work; some plates are made hollow in the center and both sides filled with small holes, the hollow portion of the plate being filled with lead peroxide (Pb_2O_3) or some other combination of lead oxide. In many cases the dry powder is forced into the plates, under enormous pressure, so that the powder is practically solidified. These plates are immersed in a solution of dilute sulphuric acid, 1.17 specific gravity (1 part acid and 5 parts distilled water), and when all the active material, on the negative and positive plates, has been completely reduced to the new substances already stated, no further action takes place, except the decomposition of the water; continuing the charge produces what is known as the sign of a fully charged cell, namely, milky or boiling, and beyond this point, further charging is only a waste of energy. When the cell is put in use (after charge has ceased) the flowing of the current in an opposite direction reduces the lead peroxide, on both positive and negative plates, back to lead oxide and lead sulphate respectively. A cell in good condition has the positive plate a deep red or chocolate color and the negative slate color. Great care should be taken to avoid white patches, known as sulphating, as when these are released by charging they generally take with them some of the active material, thus destroying the efficiency of the cell. The white sulphate thus formed by discharging the cell too low, increases the internal resistance of the cell, produces cross-talk, etc., and may be avoided by not continuing to discharge the cell below 1.8 volts. Buckling or warping of the plates comes from the same source and should be avoided. The plates should never be left exposed to the air in a dry state, nor should the cell be left standing uncharged, as both produce white sulphate.

The specific gravity of the electrolyte should be kept up to 1.200, and this can only be done by keeping them well charged; it is not always necessary to add acid when the specific gravity falls below this, but charging is needed as sulphuric acid is formed during charge and decomposed during discharge. The voltage of all cells is given at 2 volts, which during charge should be about 2.5 volts, falling rapidly, after ceasing the charge, to 2 volts. They are rated according to ampere hours (found by multiplying amperage by hours discharging) and generally run about 4.5 ampere hours per pound of plate (both elements). The discharge rate is about .02 amperes per square inch of surface of the

positive plate. Resting the battery in a charged state is helpful and should be done occasionally; but under no circumstances must they be rested in a discharged state. The larger the cell, the lower the internal resistance when charged. If there is the slightest suspicion of sulphating it is best to continue the charging, at a moderate rate, beyond the boiling point, as this will gradually remove any white sulphate. The time taken to fully charge the cell divided by the time taken to discharge it to 1.8 volts will give the percentage of loss. The life of a cell cannot be given, as conditions vary, but a well formed and constructed positive plate, with moderate use, should last about five years if properly cared for. The negative plates, with same care, fifteen to twenty years. It will be real economy to have enough cells to be able to discharge at a moderate rate, as the life of the cell will be longer and results more satisfactory. The cells, for large telephone installations, are usually put up in lead-lined wooden tanks, water-tight and painted with asphalt. The cells usually contain several plates welded together so as to form one positive and one negative plate, so arranged that each plate or section has opposite it the surface of the opposite element. They are usually $\frac{1}{4}$ inch thick and square, between them are glass tubes as insulators and the proximity of the sections can explain the necessity for avoiding buckling, which would short circuit the battery. The lugs of all the sections (or segments) are welded together by a hydrogen flame, making them one solid mass. Over the top is placed a sheet of glass to condense the water as it evaporates and passes off in the boiling stage, these sheets of glass are insulated from the plates by hard rubber stools. There are, as in primary cells, many kinds of accumulators, but they differ only in the arrangement of the plates and in details, the principles and care being the same. For the transmitters on switchboards, two cells will be found sufficient; while for line signaling at least ten will be necessary. The average cell has about .002 ohm internal resistance and the external resistance must be kept as low as possible to obtain the best results.

The wires from the transmitters should not be less than No. 12 B. & S. and terminate on a heavy copper bus bar, having wires connected to the accumulators of No. 0 gauge well insulated. One transmitter is generally allowed to each ampere hour of the cell's capacity for each 24 hours.

Two sets are generally provided, one being discharged while the other is being charged; but lately the tendency has been to use only one set, charging while in use and overcoming the noise due to the charging by using a large choke coil. The charging may be done in two ways; in small installations, the ordinary 110 volt lighting circuit may be used and the lamps, already in service, used as a resistance; or in larger installations, special machines may be provided. The lamps serving as resistance should be connected in parallel. One-half ampere lamp should be used for each half ampere of charging current necessary. The following will greatly help in the maintenance of this battery. The state of charge can always be known by taking specific gravity readings of the electrolyte. Nearly all hydrometers have a red line drawn around the 1.200 mark. When the plates are immersed in the solution for the first time, gas bubbles will be observed

to rise from the plates to the surface, due to local action and causing the specific gravity to fall; but on being charged, this will rise again and more acid should not be added, as is frequently done through ignorance of this fact. It is safe to continue the charging as long as the specific gravity continues to rise. In adding water, always use a syringe, thereby enabling you to place the water at the bottom of the cell so that it may be thoroughly mixed with the acid. Never allow the specific gravity to fall below 1.175. Note carefully the specific gravity at beginning and end of charge and you will know the fall due to discharge, and thereafter can tell, at any time, the condition of the cell; for example, if the specific gravity reading is 1.200 at the end of the charge and falls to 1.175 at end of discharge, it will be about $\frac{1}{4}$ discharged when reading shows 1.188, and so on. You cannot tell how much charge is left by the voltage. The batteries should be examined carefully with an electric lamp, so shaded as to throw the light clear through the cell to the bottom, so that any particles, scales, etc., likely to cause short circuit, may be seen and removed. When the plugs commence to bulge, they should be pressed back into the plate with a piece of flat hard wood or ebony; never use metal of any kind. Never cease the charging until the solution is milky and spray (or gas) is rising from the plates. Storage batteries are, without doubt, a coming factor in modern telephony, and their use is becoming more and more necessary, and the sooner we realize the importance of properly caring for them the more use we will find for them. Telephone men, as a rule, have not studied their accumulators as they ought to have done, and have expected too much from them. Be very careful in mixing the solution to pour in water first, five parts, then add the acid, one part. They should be kept away from metal surfaces, as the gassing will corrode them, unless they are coated with grease. It is always necessary for the successful operation of accumulators that a factor of safety be had, that is, there should be no necessity, as previously stated, for heavy charge and discharge, as this leads to the rapid deterioration of the plates.

The number and capacity of the cells should be in excess of the demand. It is absolutely necessary that all vegetable matter and sediment be avoided, and no other water should be used except distilled, thereby avoiding the possibility of trouble.

BLUE-PRINTING BY ELECTRIC LIGHT.*

BY H. G. REIST.

In large manufacturing establishments the short and frequently dark and cloudy days of winter are the occasion of great inconvenience and delay in the production of blue-prints. A printing plant suitable for making the required number of prints in summer will be entirely inadequate for the same production in winter. Unfortunately, this is a department which ordinarily cannot be worked overtime in order to make up for the loss. Suffering much on this account because of the large number of blue-prints required, the General Electric Company some time ago tried several methods of printing by electric light. In one plan a small room was arranged with nine arc lamps, placed about 18 inches apart, suspended from the ceiling, and by a suitable arrangement of

*Paper read at the Milwaukee meeting (May 28-31, 1901) of the American Society of Mechanical Engineers.

reflectors, a large portion of the light was thrown downward on printing frames arranged on trucks, being the same frames which are used ordinarily for printing by sunlight. The reflectors are hinged so that the light may be thrown to the position wanted. With a rapid printing paper the time required for printing with this arrangement is from six to eight minutes.

Another arrangement for printing, and one which is being used extensively with somewhat more satisfactory results, consists of two lamps, each being a standard 5 ampere, 110 volts inclosed arc lamp, inclosed by a metal hood a little larger in size than the printing frame. The hood is strongly constructed of sheet iron, with parabolic sides, which are finished on the inside with white enamel, having good reflecting power. The hood is supported on the lamps, and in order to prevent the parts from overheating, an effective ventilating device is provided at the top. There are also handles on the side so that it may conveniently be moved along the track. The lamps in turn are supported on a small trolley arrangement, made from the parts used for sliding folding doors, and on each side there is a conducting wire from which a small trolley wheel carries the current to the lamps. The tracks on which the lighting device is supported are of sufficient length, so that five printing frames can be set under each of them, and the lamps readily moved to cover any one of them. The printing frames which we are now using are the standard frames used for sun printing, although they can be somewhat simplified if they are made specially for printing by electric light. The lamps are inclosed in white opal globes. This diffuses the light and the white interior of the reflector projects it downward, so that the area over the print to be made is very uniformly lighted, there being no perceptible difference in the tone of the print in the middle from what it is in the corners. When the first print has been exposed a sufficient length of time, the light and the hood are moved along the track to the next frame, while work is begun on the first one to replace the printing paper or tracing as the case may be.

The time required for printing naturally varies widely with different tracings and different makes of paper. In general, it may be stated that the time required is three times or four times as long as with bright sunlight. With one grade of paper which we are using, the time by sunlight in the middle of the day during February is about thirty-five seconds, and by electric light one and one-half minutes. It will readily be seen that there are great advantages in having a printing establishment which is independent of the season or of the condition of the weather. With an electric equipment blue prints may be put into the factory almost immediately after the completion of the tracing, regardless of the time of day.

In summer it is possible to print all the time during office hours, and the per cent. of time lost on account of cloudy and rainy weather is small. In winter it is not practical to print after about 4 o'clock in the afternoon, and the amount of bad weather is a large part of the total time. In the belt in which I live it is cloudy as much as 60 per cent. of the time during the months of December and January. In cloudy weather the time required for printing is about eight times to ten times as great as on a clear day, and on a rainy day it is

not possible to print at all out of doors, except by a specially devised waterproof printing frame; but at such times the time required for changing prints is greatly increased, as the frame has to be wiped to keep from injuring the tracing.

From curves of the actinic value of sunlight for different times of the day and for different seasons, I have calculated that with a paper so rapid that it will print in eight seconds in the sun at noon during the month of July, the mean time required for making a print in January for the hours from 8 to 12 and from 1 to 4 is 2.33 minutes. Similarly, in July the mean time for the hours above, except that the time is extended to 5.30 in the afternoon, is 0.59 minutes, or the mean time for clear days during the year is 1.40 minutes.

Taking all the above into account, I find that the average number of prints made by one operator in winter per day is 26.4. In summer the number of cloudy days are about 25 per

as much as twenty minutes may be required. It will then be found an advantage to use electric light printing as a supplement to the ordinary method, even if the latter method is not entirely superseded. Among other advantages may be mentioned the smaller space required for an installation for a given output than for sun printing; also, there will be less paper wasted, as the time for printing is much more uniform.

This method of making prints will especially appeal to manufacturers who are located where there is a tendency to have fogs or where tall buildings may interfere with the normal sunlight.

English Electrical Engineers to Visit Germany.

(From our London Correspondent.)

The visit of the Institution of Electrical Engineers to Berlin commences on Saturday, June 22, when the party will leave London for

ELECTRICITY BUILDING (from a recent photograph), PAN-AMERICAN EXPOSITION.

cent., and the average number of prints that may be made by one operator are 57.3, or more than twice as many as can be made in winter.

The cost of making prints by electric light is much smaller than one would expect, and the following figures indicate that it is cheaper to use artificial light than sunlight for this purpose.

In printing by electric light it is assumed that the cost of electricity is 12 cents per kw.-hour, which, I believe, is a fair commercial rate. The lamps are turned off when not in use. They are in use only 85 minutes for each operator, as shown in the table below. Each lamp requires 550 watts, and the cost is 18.7 cents per day.

Labor is assumed at the rate of \$1 per day:

	Sunlight.	Electric light.
Number of prints per day,		
mean per year.....	41.9	56.5
Cost of printing, per print	2.39 cts.	2.09 cts.

The time required for changing a print in sunlight is a little longer than when the artificial light is used, because the whole frame has generally to be moved, and the frame has to be adjusted to the proper angle to get the most effective sunlight. The time allowed for changing prints is seven minutes when printing by electric light; eight minutes when printing by sun, while when printing during a rainy day

Hanover. On Monday, June 24, the party will proceed to Berlin, and will visit the central electricity stations and a converter station.

In the evening there will be a reception and supper offered by the Allgemeine Elektrizitäts Gesellschaft and Messrs. Siemens & Halske, to which the ladies of the party are invited. On the following day Messrs. Siemens & Halske's works and electrical museum in Charlottenburg will be visited in the morning and the Berlin new elevated electric railway in the afternoon. On Wednesday the cable works of the Allgemeine Elektrizitäts Gesellschaft and the tunnel under the river Spree will be visited and in the evening a dinner will be given to the Institution by the two firms who hitherto had entertained the members. On the following day visits will be made to various works, which will bring the official visit to Berlin to a close.

The party will be divided into three sections. The first, as we have just stated, will visit Berlin. The second and third groups will in the afternoon proceed to Dresden, where they will be received in the evening in the Gewerbehaus. On Friday morning papers will be read at a meeting of the German Elektro-Technical Society, whilst in the afternoon visits will be made to the light and power stations of the town and to the State heat-

transmission plant and electricity works. On the following day the German-Elektro-Technical Society will meet in the morning, and there will be visits to various electricity works in the afternoon and an outdoor reception in the evening. Sunday will be devoted to a visit to "Saxon Switzerland," and on Monday the third group will proceed to Nuremberg, visiting local works on Tuesday and proceeding on Wednesday to Frankfurt, where visits to works and an evening entertainment will complete the programme of the day. Thursday will be devoted to visits to central stations and installations in Frankfurt, and on Friday, July 5, there will be an excursion down the Rhine to Cologne, which will be so arranged as to permit of the members arriving in London on the morning of the following day.

High Praise for the Trade Journal.

A prominent business man, whose opinion is held in high repute, discussed the trade press with the writer recently, and his observations are interesting:

"Trade journalism," said he, "is to the trader an index, educator, informant, teacher, profit-gatherer, counsel—in short, the prized silent partner. The trade paper is an insurance against the dishonest, tricky salesman; is the champion of the trader against unjust charges or rules, whether attempted by a railway organization or an individual; it is the advocate of organization, the mouthpiece of associations; their champion and defender—therefore, worthy of the support of every one interested in co-operative effort.

"Primarily, the trade journal is for the dealer; the man so anxious to concentrate all his energy upon his business that he seeks all aids, and is willing to pay for news or information that is calculated to push him forward to success.

"The trade journal is a tool of business. If the tool is poorly tempered, of weak constitution and untidy appearance, it will exert no influence, do more harm than good; turn traders into blunderers and live a short life. If on the other hand, this tool of trade is well tempered, put together in attractive style, has force, a moral tone, and puts character first, it will live and thrive, and as it grows older exert more and more influence—secure respect for its opinion. The trade journal, then, to be a power, to have merit, to become the trader's tool, must be worth paying for. It must have individuality of its own, for in this world men count for more than method.

"By taking a trade paper you become an associate worker for your own and others' benefit, and thus carry out the highest ideals of conduct. You should ever keep in mind the old proverb, 'A man of knowledge increaseth in strength.'"

"The Thoroughfare of the Nation."

In a recent article on the growth of the traffic on the New York Central, the Rochester "Herald" says: "The New York Central may well be called the thoroughfare of the nation."

This statement was brought out by the last census, which shows that of the people living in the cities of 8,000 or more inhabitants, more than one-half live along the New York Central Lines; and of the people living in cities of 100,000 or more inhabitants, two-thirds live along the New York Central Lines.

These and other startling figures are given in No. 13 of the "Four Track Series."

Standardizing Street Railway Equipment.

The Committee on Standards of the American Street Railway Association held a meeting at Niagara Falls on the 3d inst. The object of the meeting was to map out the preliminary work of the committee. An abundance of material, which had been gathered by the secretary, was placed before the committee for consideration. It was apparent, from the data in the hands of the committee, that both street railway operators and manufacturers of street railway appliances are much interested in the work of standardizing street railway equipment. It was decided that the best results could be obtained by apportioning the work among the members of the committee, each member to act as a sub-committee on certain parts of the work assigned to him, with power to incur reasonable expense in the preparation of plans and specifications, and to report at the next meeting of the committee. The following assignments were made:

To consider two forms of rail, the "T" rail, and a grooved girder rail, each with a modified form of head; to consider two forms of wheels, one a cast chilled wheel, with either spokes or plate center, the other a steel tired wheel, with either spokes or plate center, tread and flange of wheel to conform to the rail to be recommended; to consider the wearing parts of trucks, the center-bearing swing bolster for double trucks to be recommended; to consider a standard for axles, journals, journal brasses, oil-boxes and brake-heads such as will fit the trucks of different makers—Mr. N. H. Hest, Meriden, Conn.

To consider electric motors with a view to standardizing all parts of the motor, including suspension, lead wires with connector boxes and ventilation—Mr. W. J. Hield, Minneapolis, Minn.

To consider single truck and double truck car bodies, including open cars for city and suburban service, in order to determine wherein such cars can be standardized to meet the requirements of various conditions of operation, with due regard to proper ventilation—Mr. John R. Graham, Boston, Mass.

To consider the standardizing of overhead material as far as practicable along the following lines: trolley wire, trolley wheels, trolley ears, trolley hangers, span wires, pull-off wires, section insulators, cut-outs, overhead frogs and switches, lightning arresters and all parts that go to make up the overhead system—Mr. C. F. Holmes, Kansas City, Mo.

Mr. T. E. Crossman, 1829 Park Row Building, New York, is secretary of the committee, and he will be glad, on behalf of the committee, to receive any communications bearing on the above-named subjects from any interested persons.

Bell Telephone Business Bad.

Gen. John I. Sabin, recently chosen president of the Central Union Telephone Company of Chicago, has shocked the telephone world by the extremely unconventional circular letter addressed by him to the stockholders in which he bluntly states some unpalatable truths and vigorously urges heroic remedies.

He finds it imperative that \$5,000,000 new capital be immediately provided and suggests three plans: An assessment of \$60 in three installments; a 4 per cent. loan of the same amount to the company by stockholders; pur-

chase by stockholders of the \$3,000,000 capital stock.

In stating the need for some such measure, Gen. Sabin says: "There is no use crying over spilled milk, or abusing one another for things not accomplished. Illinois, Indiana, Ohio and Iowa want telephone service. Will you supply it, or must some one else?"

Exports of Electrical Material from New York.

The following are the exports of electrical material, from the port of New York, for the week ended June 5:

Antwerp, 8 packages, \$833; Argentine Republic, 106 packages, \$4,302; Australia, 237 packages, \$11,682; Brazil, 156 packages, \$1,921; Bremen, 4 packages, \$154; British East Indies, 1 case, \$20; British West Indies, 34 packages, \$617; Central America, 41 cases, \$1,201; Chili, 9 cases, \$275; Cuba, 11 cases, \$701; Dublin, 3 packages, \$90; Dutch East Indies, 1 package, \$21; Glasgow, 75 packages, \$6,385; Halifax, 10 cases, \$476; Hamburg, 31 packages, \$1,181; Havre, 49 packages, \$2,628; Hull, 2 cases, \$163; Japan, 170 cases, \$14,056; 4 packages, \$4,597; Korea, 3 cases, \$73; Liverpool, 204 packages, \$7,199; London, 135 packages, \$11,359; Manchester, 5 packages, \$190; 3 cases, \$637; Mexico, 118 cases, \$5,293; New Foundland, 14 cases, \$400; New Zealand, 6 packages, \$120; Nova Scotia, 2 cases, \$21; 8 packages, \$1,042; Peru, 8 packages, \$436; U. S. Colombia, 27 packages, \$916; Venezuela, 1 package, \$16; Vienna, 4 packages, \$300; Waereghon, 84 cases, \$1,764.

The following are the exports of electrical material, from the port of New York, for the week ended June 12.

Antwerp, 16 packages, \$894; Argentine Republic, 99 cases, \$2,388; Australia, 73 cases, \$13,452; 8 motors, \$250; 6 motor vehicles, \$5,000; Barcelona, 12 packages, \$426; Berlin, 40 cases, \$380; Bilbao, 2 cases, \$100; Brazil, 35 cases, \$982; 14 cases motors and parts, \$180; Bremen, 4 packages, \$120; British Guiana, 18 packages, \$410; British East Indies, 1,633 packages, \$253,914; British West Indies, 3 packages, \$138; Canary Islands, 1 package, \$5; Central America, 3 packages, \$62; Copenhagen, 2 packages, \$30; Cuba, 174 cases, \$5,985; Dundee, 1 package, \$30; Dutch West Indies, 4 packages, \$41; Ecuador, 115 packages, \$903; Genoa, 14 packages, \$926; Gijon, 9 cases, \$1,622; Glasgow, 4 packages, \$575; Hamburg, 31 packages, \$1,277; Havre, 137 packages, \$17,162; Japan, 18 packages, \$650; Libau, 2 packages, \$21; Lisbon, 1 package, \$30; Liverpool, 927 packages, \$9,357; London, 580 packages, \$34,551; Marseilles, 25 packages, \$300; Mexico, 93 packages, \$2,175; Milan, 8 cases, \$1,164; Moscow, 15 packages, \$1,791; Palermo, 1 package, \$9; Peru, 4 cases, \$210; Riga, 6 packages, \$600; Southampton, 11 cases, \$258; 10 packages, \$1,030; Stockholm, 1 case, \$17; St. Petersburg, 2 cases, \$257; St. Helena, 3 packages, \$190; Uruguay, 1 package motor carriage, \$290; U. S. Colombia, 4 packages, \$113; Venezuela, 91 packages, \$1,696.

PERSONAL MENTION.

Mr. D. Le Roy Dresser was recently elected president of the Merchants' Association of New York.

Mr. John Waring, president of the Franklin Electric Company of Hartford, Conn., who was burned in the explosion of gasoline at the company's experimental room, died last week at the Hartford Hospital. He was a talented electrical engineer and invented several electrical devices.

INCORPORATIONS.

The Vulcan Electric Light, Heat & Power Company, Trenton, N. J. Capital stock, \$10,000.

The Wheeler Green Electric Company, Rochester, N. Y. Capital stock, \$4,000. Directors: W. J. Dadee, Clarence Wheeler and T. H. Green, all of Rochester.

The Mountain Water & Electric Company, Stockton, Cal. Capital stock, \$25,000. Incorporators: J. U. Castle, L. A. Richards and J. P. Spooner.

The People's Gas, Electric & Heating Company, Bloomington, Ind. Capital stock, \$10,000. Incorporators: A. M. Barron, F. B. Sherman and others.

The Standard Electric Distributing Company, San Francisco, Cal. Capital stock, \$5,000,000. Directors: R. J. Davis, J. M. O'Brien, T. E. Ryan, C. H. Pennoyer and J. E. Green.

The International Electric Syndicate of New York, Dover, Del.—to manufacture lyddite, giant powder and other high explosives. Capital stock, \$500,000.

The Tuckerton Electric Company, Camden, N. J. Capital stock, \$10,000. Incorporators: Ezra A. and John H. Bell and Edwin Pharo of Haddonfield, N. J.

The Scientific & Electrical Exchange, New York City. Capital stock, \$25,000. Directors: W. F. Thompson of New York City, A. E. Hartcorn of Brooklyn, F. S. Cutler and W. D. W. Miller of Plainfield, N. J.

The Postal Telegraph Cable Company of New Jersey, Jersey City, N. J.—to build, own and operate a line wholly within the State of New Jersey. Capital stock, \$50,000. Incorporators: William H. Baker, Charles P. Bruch and Theodore L. Cuyler, Jr.

The New Jersey Power Storage Company, Trenton, N. J.—to purchase, sell and distribute power of all kinds by electrical, pneumatic, mechanical, hydraulic and other means of transmission, and to apply such power to the transportation of passengers and merchandise, and for such other useful purposes. Capital stock, \$100,000.

COMMERCIAL PARAGRAPHS.

The number of telephone exchanges throughout the country that are being equipped with the Stromberg-Carlson Central Energy System certainly speaks well for the telephone apparatus turned out by this well-known concern. The company has been constantly enlarging its plant and only recently purchased the land and seven-story building at Clinton street and Jackson boulevard, Chicago, for \$212,000. Information regarding the Stromberg-Carlson Mfg. Company's apparatus may be obtained by addressing a letter to 70-82 W. Jackson boulevard, Chicago.

Persons contemplating building a telephone exchange would do well to communicate with the Independent Telephone Construction Company, 85 Dearborn street, Chicago. This popular concern will furnish plans and specifications for any kind of telephone construction and stands ready to build and equip exchanges with any make of apparatus desired.

Messrs. E. M. Van Duzee, Jr., & Co., Fifth and Jackson streets, St. Paul, Minn. (Minneapolis office 830 Guaranty Building), announce that they have recently completed arrangements with the Haines & Noyes Company, manufacturers of Guaranteed Telephone Apparatus, to represent them exclusively as their agents for the State of Minnesota. They inform us that they will be in position to sell to the trade as well as to the consumer, and that the prices will be identical with those of the Haines & Noyes Company.

We have been informed by the Ericsson Telephone Company, 296 Broadway, New York City, that the Ericsson telephone was awarded first prize at Paris, 1881; Madrid, 1883; Vienna, 1884; Stockholm, 1886; Copenhagen, 1888, and Chicago, 1893. Also that its exhibit in Paris in 1900 was from the St. Petersburg, Russia, factory, which was also awarded first prize. This year its exhibit of a fifty-subscriber switchboard and a few of its different telephones at the Pan-American Exposition at Buffalo is made in Section S of the Electricity Building and Mr. W. Jac Marland will have charge of the exhibit. The Ericsson Company extends

to all its friends and patrons a cordial invitation to see its exhibit and talk over its instruments. It is exhibiting its goods in connection with others in a collective electrical exhibit, which will doubtless prove of interest to many of our readers.

The American Toll Telephone Company, 43-47 Sheriff street, Cleveland, O., has lately added to its already complete line of pay stations a new call register for measured service. The Bell Companies have for years considered this part of their service very profitable to them and these small instruments are in use in very large numbers. As yet the Independent field has not had access to an instrument of this kind, but the above company has already taken large orders for its machines.

It is built on different lines than the register used by the Bell Companies and cannot be manipulated in any way, and it is impossible to obtain signals by rapping the box on the side. Many telephone companies are now advertising measured service at the rate of 600 calls for 3 cents per call—all over and above that at 5 cents per call. This call register notifies operator, also keeps an accurate account of all outgoing calls, thus saving all disputes between subscriber and central, as the register is in plain view of the subscriber. This part of the telephone service is one that may be investigated by the Independent Companies with much profit to themselves and satisfaction to patrons. The instruments are sold at a very reasonable figure and can easily be attached to any telephone.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED JUNE 11, 1901.

ELECTRIC RAILWAYS AND APPLIANCES.

676,085. System of Electric Propulsion. Henry Halberstadt, Kenosha, Wis. Filed Jan. 26, 1900.

676,108. Electric-Railway System. George Westinghouse, Jr., Pittsburgh, Pa., assignor to the Westinghouse Electric & Manufacturing Company, same place. Filed June 21, 1890.

676,190. Racing Trolley-Track. Charles W. Hutchinson, New York City. Filed March 16, 1901.

676,378. Safety Trolley-Base. Andrew C. Wolfe, Denver, Col., assignor of two-thirds to Charles K. Wolfe and Frank Dillingham, same place, and Joseph F. Hewitt, Allegheny, Pa. Filed Jan. 22, 1901.

ELECTRIC LIGHTS AND APPLIANCES.

676,068. Incandescent Electric Lamp. Levi Lobenthal, New York City, assignor of one half to Thomas E. McIver, same place. Filed Oct. 11, 1900.

676,069. Incandescent Electric Lamp. Levi Lobenthal, New York City, assignor of eleven-twentieths to Thomas E. McIver, same place, and John McCullough, Newark, N. J. Filed April 1, 1901.

676,074. Incandescent Electric Lamp. John McCullough, Newark, N. J., assignor of three-fourths to Thomas E. McIver, Michael Lobenthal and Levi Lobenthal, New York City. Filed April 2, 1901.

676,202. Incandescent-Lamp Socket. Walter H. Perkins, Waterbury, Conn., assignor to the Waterbury Mfg. Co., same place. Filed April 9, 1901.

676,289. Switch for Electric Lamps. Charles Wagner, New York City, assignor to Edward F. Caldwell & Co., same place. Filed Feb. 28, 1901.

676,377. Elastic Support for Arc Lamps. Fredrick Wilkie,

New York City, assignor to the Manhattan General Construction Company, Newark, N. J. Filed Sept. 5, 1900.

ELECTRICAL MACHINERY AND APPARATUS.

675,931. Electric Meter. Luigi G. Cauro, Naples, Italy. Filed Dec. 31, 1897.

675,996. Electric Meter. Ludwig Gutmann, Peoria, Ill. Filed June 6, 1900.

676,267. Transformer. Walter S. Moody, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Feb. 23, 1901.

676,280. Electric Switch. Eduard Schulz, Barmen, Germany. Filed Nov. 20, 1900.

676,298. Brush-Holder. Asa F. Batchelder, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Feb. 28, 1901.

676,305. System of Motor Control. Albert G. Davis, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed March 5, 1900.

676,308. Brush-Holder. Henry Gelsenhoner, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Feb. 20, 1901.

676,344. Regulating Device for Alternating-Current Circuits. Elihu Thomson, Swampscott, Mass., assignor to the General Electric Company of New York. Filed Jan. 29, 1900.

MISCELLANEOUS.

675,978. Electrograph. Michael Beck, Minneapolis, Minn. Filed Aug. 8, 1899.

675,894-675,895. Printing-Telegraph. Freeman H. Littlefield, St. Louis, Mo., assignor of two-thirds to Mordecai Yarnall and J. O. Chenoweth, same place. Filed June 18, 1900, Feb. 23, 1901.

675,918. Storage Battery. Vincent G. Apple, Dayton, O., assignor to the Dayton Electrical Manufacturing Company, same place. Filed Nov. 1, 1900.

675,995. Method of Producing Phase Compensation. Ludwig Gutmann, Peoria, Ill. Filed Jan. 28, 1901.

676,006. Reception and Retransmission of Electrical Impulses. Alexander Muirhead, Shortlands, Eng. Filed Feb. 20, 1901.

676,065. Automatic Electric Fire-Alarm. Willis J. Brewster, Port Ewen, N. Y., assignor to Emily E. Brewster, Esopus, N. Y. Filed Aug. 4, 1900.

676,091. Printing Telegraph Transmitting Apparatus. Kirk Himrod, Chicago, and John R. Tucker and Charles C. Hinckley, Aurora, Ill., assignors to the International Typal Telegraph Company, Detroit, Mich. Filed March 10, 1899.

676,092. Railroad Signal Apparatus. John K. Hoddinott, Baltimore, Md. Filed April 30, 1900.

676,093. Electrical Contact-Making Device. Preston R. Pappin, St. Louis, Mo. Filed Sept. 24, 1900.

676,099. Electric Igniter for Explosive-Engines. John V. Rice, Jr., Edgewater Park, N. J., assignor to the John V. Rice, Junior, Company, same place. Filed Aug. 12, 1897. Renewed Nov. 3, 1900.

676,105. Protecting Device for Coils of Electrical Apparatus. Percy H. Thomas, Pittsburgh, Pa., assignor to the Westinghouse Electric & Manufacturing Company of Pennsylvania. Filed Nov. 9, 1900.

676,103. Sound-Recording Apparatus. Louis P. Valquet, New York City, assignor to the Universal Talking Machine Company, same place. Filed June 8, 1899.

676,187. Printing Telegraph Receiver. John M. Joy, New York City, assignor to the Printing Telegraph News Company, same place. Filed Sept. 20, 1900.

676,166. Regulating Roentgen-Ray Tubes. Harry F. Walte, New York City. Filed March 23, 1901.

676,185. Lightning-Protector for Electrical Apparatus. Franz Gatteringer, Vienna, Austria Hungary. Filed March 28, 1896.

676,263. Automobile. Isidor Kitzee, Philadelphia, Pa. Filed March 29, 1901.

676,281. Electrode for Primary Batteries. William T. Seddon, Philadelphia, Pa., assignor to Herman J. Dercum, trustee, same place. Filed Dec. 17, 1900.

676,300. System of Electrical Distribution. Ernst J. Berg, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed March 9, 1900.

676,311. Mechanism for Controlling and Indicating Temperature Limits. Ernest H. Griffiths and William C. D. Whetham, Cambridge, Eng. Filed Dec. 19, 1900.

676,332. Apparatus for Wireless Telegraphy. Guglielmo Marconi, London, Eng., assignor to Marconi's Wireless Telegraph Company, Limited, same place. Filed Feb. 23, 1901.

676,333. Apparatus for Making Electrodes. George J. Miller, Kenton, O. Filed Feb. 5, 1900.

676,339. System of Distribution. Horace F. Parshall, London, Eng., assignor to the General Electric Company of New York. Filed Jan. 23, 1901.

676,346. Electric-Clock Signal. Harry B. Vaughan, Little Rock, Ark. Filed Jan. 31, 1901.

676,365. Means for Electrically Lighting Lightships or Other Stationary Vessels. Jurgen H. Junge, Cuxhaven, Germany. Filed June 28, 1900.

THE TELEPHONE WORLD.

New Telephone Line in California.

The Sunset Telephone Company has started work on a new line from Stockton to Fresno alongside of the Santa Fe Railroad track. The wire to be used will be the first of its kind put up in California. It will be an aluminum cable of seven strands, or separate wires, and it will be possible to handle a large amount of business over it every day.

While there has been a telephone line to Los Angeles for years it is by way of what is known as the coast route, or from San Francisco to Santa Barbara and then into the Angel City. The telephone company proposes to have a direct system between Stockton and Los Angeles through the center of the San Joaquin Valley. It has just completed a new line from San Diego, through Los Angeles to Bakersfield and repaired the system between the latter town and Fresno. By constructing a new line from Stockton to Fresno a direct system will be opened.

For several weeks the Santa Fe has been distributing large masts along its road between the raisin center and Stockton at odd times, and has just finished putting out the last of the poles. A large force of men is working a few miles south of Stockton. It is expected that the new system will be in operation by the end of June, though it may take longer to finish it. This new aluminum wire is said to be the best made, as conversation over it is much more distinct than the old copper wire.

After the new system is opened the telephone company will extend the line from Stockton west to Point Richmond along the Santa Fe, a distance of 75 miles, and thence across the bay into San Francisco.

New Telephone Attachment.

Letters of patent have been asked for by I. O. Persons, of Dublin, Ga., on a telephone attachment, which will do away with the necessity of ringing the central office when one desires connection over the telephone, nothing being required but to lift the receiver from the hook and tell the operator at the exchange what number is wanted. Mr. Clark Grier, manager in Dublin for the Southern Bell Telephone Company, has purchased an interest in the invention. All familiar with telephones who have seen the attachment at work are said to be satisfied with its practicability. Mr. Persons, who is the superintendent for the Dublin Telephone Company, has invented several telephone appliances.

Messrs. Boynton & Earl of Waco, Tex., were in Fort Worth a short time ago in the interest of a franchise for a telephone company to be known as the Lone Star Company. They met a number of citizens and J. E. Boynton presented the matter. He said that the company he represented was organized at Waco, and that it was operating a successful exchange there, as well as at other points in the State, including San Antonio, with over 1,800 phones; Houston, with 1,400; Corsicana, with between 400 and 500, and that the company was arranging for exchanges at Austin, Belton, Temple, Taylor, Waxahachie, Cleburne, Hillsboro, Denison, Sherman and other points in the State, and also that the company in operating its long-distance lines had fixed a rate of 15 cents for two minutes for twenty miles. He stated that the company would expend \$200,000 in improvements in Fort Worth if the city council would grant the franchise desired.

The Avondale, Ga., rifle range is to be equipped with a new telephone system. The contract for the work was given recently. The system will cost \$175, and when completed will admit of communication with the markers in the pits in a much more satisfactory manner than is now possible with the old telephone or the megaphone. With the perfection of the new telephone system, there will be absolutely nothing else to be desired for the range.

The Home Telephone Company of Louisville, Ky., has purchased property costing \$15,000, and will shortly begin the erection of one of the most modern telephone exchanges in the United States. When complete it will cost \$50,000 or over.

At the annual meeting of the stockholders of the telephone company of Daytona, Fla., held recently, it was voted to increase the capital stock and build a line to De Land to connect with the Jacksonville and Tampa long distance line.

W. D. Medearis of Fayetteville, Tenn., has lately been in Sewanee establishing an exchange for the Cumberland Telephone Company, which is near completion. Iliff Conger is manager.

The Piqua, O., Home Telephone Company has increased its capital stock from \$75,000 to \$100,000.

The Galesburg, Ill., Union Telephone Company has certified that it has increased its directors from five to eleven.

Russia to Study American Telephone Systems.

With the view of the early adoption of an improved municipal telephone service, the local authorities of St. Petersburg are about to dispatch an engineer to make a comprehensive study of American systems. Russia has long been jealous of the commanding position held by Sweden in the field of telephones, and her technical authorities point out that the United States is the only country in the world in advance of Scandinavian ideas in telephone matters.

The Home Telephone Company of Trenton, N. J., has practically changed hands. The majority of the bonds has been purchased by Hugh H. Hamill, president of the Trenton Trust & Safe Deposit Company. The name of the parties Mr. Hamill represents has not yet been made known. By Mr. Hamill's purchase, the parties he represents are now practically in control of the Home plant. The bonds acted as a mortgage on the stock and as the stockholders allowed them to mature without meeting the interest the bondholders have the right to foreclose. The Morton Trust Company of New York, which acts as trustee of the bondholders, began the preliminary proceedings some time ago, but under instructions from the bondholders it delayed action, pending a settlement of the company's affairs. If the promoters secure the remainder of the bonds they will have a mortgage on the entire stock, and in this event its purchase will follow, as the stockholders are very anxious to sell.

News from Washington, D. C., states that Walter C. Allen, the electrical engineer, recently requested that the Chesapeake & Potomac Telephone Company be asked to give the District the benefit of the reduction in rates for extra equipment used in connection with the exchange telephones in the various offices of the District Government. After some correspondence between the commissioners and the company the reduction in the rates of equipment has been arranged.

The Michigan Telephone Company of Detroit has discontinued compelling use of nickel-in-the-slot telephones and calls are now answered from central in the old manner without the necessity of putting up five cents. The company claims it put the system in to help out the druggists and that it has never paid. It is now optional with the druggists whether they keep up the slot arrangement or not.

The Remsen, N. Y., & West Canada Telephone Company has purchased of the Central New York Telephone & Telegraph Company its line from Hinchley to Trenton, N. Y. Later the line will be extended to Piseco Lake.

The telephone line leading from Loudon to Morgantown, Tenn., has been completed to Birton's Mill, eight miles distant, and the phones are now ready to be put in. When completed this will give two lines to Morgantown. One by the way of Knoxville and one almost on a direct line through Piney.

An independent telephone company, backed by Denver capitalists, will establish a telephone system in Cheyenne, Wyo., at once, providing the city council will grant a charter. Phones in residences will cost about \$1 per month, and business houses will be assessed about \$2 per month.

A new and complete system of Bell telephones will soon be in operation at Austell, Ga., connecting that city with Atlanta, in addition to Mableton, Lithia and other local stations. B. H. Veal is president of the company and R. B. Cloud is secretary, and the enterprise gives promise of being successful.

The Northwestern Telephone & Telegraph Company is extending its lines to Cranberry Lake, N. Y., and expects to have them in operation in a few weeks.

The Twin City Telephone Company of Minneapolis, Minn., filed an amendment to its articles of incorporation fixing its debt limit at \$1,000,000.

The Sidney, O., Telephone Company has increased its capital stock from \$40,000 to \$60,000.

A telephone line is to be constructed between Altoona and Wisner, Neb.

The Iron Range Electric Telephone Company of Minneapolis, Minn., has increased its capital stock from \$50,000 to \$75,000.

The Collinwood, O., Home Telephone Company, lately increased its capital stock from \$25,000 to \$50,000.

Telephones for Trolleys.

The Worcester, Mass., Consolidated Street Railway Company will equip all its suburban lines with private telephone systems. This is the most effective means used by suburban street railway companies to run cars on a single track line in safety without occasional long waits at the turnouts. The contract has been let to the New England Telephone & Telegraph Company to install the system and linemen are at work putting up the telephones and stringing the wires. The lines to be equipped are the Fitchburg division, the Spencer and the Millbury lines. The only other suburban lines operated by the Consolidated, the Worcester & Marlboro and the Grafton lines, have had telephones from the start.

Wisconsin has telephone service by mutual companies doing business in many cities under what is called the "Wisconsin valley plan." It is strictly co-operative. Stock can be bought only by persons that rent telephones, and such persons can buy as many shares of stock as they rent telephones, and no more. Whenever the stockholder ceases to rent as many telephones as he holds shares, the company has a right to cancel his excess and refund to him its par value. The company binds itself to furnish stock to every renter of its service. It must also regulate its monthly charges so as to be able to pay a dividend of 1 per cent. a month, to be credited to the monthly renter. In Grand Rapids a rental of \$2.25 a month for business houses and \$1 for residences is charged, and a monthly dividend of 1½ per cent. (75 cents) is credited on the rental account of each stockholder, so the stockholder actually gets his business telephone for \$1.50 and his dwelling telephone for 25 cents a month.

The council of Starke, Fla., has granted to M. G. Rowe of Madison an exclusive franchise for twenty years for the construction and operation of a local telephone exchange in Starke. Mr. Rowe says he will begin work on or by July 1, and will have the system in good working order as possible, probably by September 1, and not later than October 1.

Newton, Tex., is soon to have telephone connection with the outside world. J. M. Smith of Beaumont made a proposition to build his line into Newton from Roganville, if the people would put up a small bonus, which they have done.

The telephone line from Roan's Prairie to Singleton, Tex., both towns in Grimes County, has just been completed, and work will shortly begin on to Bedias and finally to Madisonville in Madison County.

The Zenith Telephone Company has leased ground on Avenue "A" in Cloquet, Minn., and will at once erect a building for a central telephone station.

The Alabama & Georgia Long Distance Telephone Company has improved the line between Gadsden and Birmingham. The entire line has been repaired.

The Elmira, N. Y., Telephone Company has filed with the Secretary of State a certificate of increase of capital stock from \$40,000 to \$150,000.

The Troy, O., Telephone Company, has increased its capital stock from \$40,000 to \$75,000.

TELEPHONE INCORPORATIONS.

The Fulda Telephone Company, Fulda, Minn. Capital stock, \$25,000.

The Napoleon Home Telephone Company, Napoleon, O. Capital stock, \$50,000.

The Jo Davies County Mutual Telephone Company, Elizabeth, Ill. Capital stock, \$2,500. Incorporators: William Skine, Ernest Stadel and Rudolph Dittmer.

The Wharton Valley Telephone Company, South Edmeston, N. Y. Capital stock, \$3,000. Directors: B. F. Bishop, Garrattsville; Van Ness D. Robinson, Edmeston; Frank Harrington, West Burlington.

The Farmers' Mutual Telephone Company, Elkhart, Ind. Capital stock, \$5,000. Directors: J. J. Zollinger, R. W. Davenport, C. R. Myers, J. R. Cripe, Harvey Myers and A. J. Yades.

The Citizens' Telephone Company, Brazil, Ind. Capital stock, \$10,000. Directors: Theodore W. Englehart, H. D. Talk, M. J. Murphy, C. J. McCullough, Oscar Houk and John G. H. Klingler.

The Frontier County Telephone Company, Stockville, Neb. —to run a line from Stockville to Curtis at once. Capital stock, \$2,000. Incorporators: A. J. Clifton, E. S. Case, M. T. Ward, J. H. Bayston, D. C. Dye, Eugene Link and Charles Riggs.

GENERAL ELECTRICAL NEWS.

Lighting.

Arkadelphia, Ark.—J. W. Wilson, instead of J. W. Urlson, has purchased the plant of the Arkadelphia Light & Water Company, and will install two dynamos, and not five as stated in the issue of June 5.

Ashpole, N. C.—This town will probably construct a system of electric lights. Dr. J. P. Brown, mayor.

Auburn, Neb.—A movement is on foot to organize a local company to construct and operate an electric light plant here.

Augusta, Ga.—The North Augusta Electric & Improvement Company was lately chartered with \$1,500,000, capital stock with J. U. Jackson, president, and F. M. Jackson, secretary.

Beloit, Kan.—The electric light plant owned by A. T. Rodgers in this city is to be enlarged.

Brookfield, Mo.—H. H. Stephens of Macomb, Ill., will obtain a franchise for an electric light plant here.

Chillicothe, Mo.—This city has voted \$20,000 for an electric light plant.

Cleveland, Tenn.—A company has purchased the Cleveland Water & Electric Light Company's plant, and will change the location of and improve the same.

Cumberland, Md.—This city will probably increase its electric light plant capacity.

East Liverpool, O.—The Wellsville Electric Light Company has increased its capital stock from \$30,000 to \$100,000.

Flora, Ill.—The city council has decided to double the capacity of the municipal electric light plant in this city.

Fortville, Ind.—J. K. Fatout of Indianapolis, and Q. A. Wright of this place, have secured a franchise for an electric light and waterworks plant, the same to be erected at once.

Gilman, Ill.—A. S. Grenier of the electric light plant is working out a plan to extend the scope of the plant to take in Danforth Ashkum and Clifton. His plan contemplates the furnishing of electricity for both street and commercial lighting.

Groton, Vt.—A. H. Bailey of Wells River is interested in the establishing of an electric light plant in this village.

Kenosha, Wis.—The Kenosha Gas & Electric Company is again figuring on the erection of a new power house in this city.

Mahanoy City, Pa.—The Mahanoy City Electric Light Company will enlarge its plant.

Manning, Ia.—Messrs. Sweeny & Ort have organized a stock company to put in an electric lighting plant here.

Mayville, Mich.—At a recent special election it was voted to bond the village for \$5,000 to purchase a municipal electric lighting plant.

Media, Pa.—At a recent meeting of the Media borough council, the light committee, Messrs. Dr. E. M. Harvey, Samuel A. Field and William H. Hardcastle with W. S. Worrell, were appointed a special committee having in view the establishment of a permanent electric light plant to be operated by the borough.

Mullica Hill, N. J.—An option has been secured on the old mill property for an electric light plant. The Mullica Hill Improvement Association can be addressed.

Nashville, Tenn.—T. J. Mooney & Co. have been awarded the contract for equipping the city electric light plant at \$32,000.

Niobrara, Neb.—The Electric Light Company has sold out the plant to Randa & Gruenberg, who will enlarge and improve it.

Omaha, Neb.—All bids for the construction and installation of the city electric lighting plant, for which \$55,000 of bonds were recently voted, were rejected by the council because they did not conform to necessary requirements. New bids will be opened in July.

Oneida, Ill.—Oneida is discussing the advisability of putting in an electric light plant.

Paris, Mo.—The citizens have voted to issue \$20,000 in bonds for the erection of an electric light plant and waterworks.

Rockville, Md.—The town council is considering the erection of a new electric power-house to replace the

one recently destroyed by fire. Such a plant as has been suggested would cost about \$10,000, and it is proposed to borrow the money on the notes of the citizens of the town.

San Jose, Cal.—San Jose is figuring on a \$75,000 electric lighting plant.

Somerset, Ky.—Articles of incorporation were recently filed by the Electric Light & Power Company with \$10,000 capital stock.

St. Clairsville, O.—An election is to be held to vote on the question of issuing bonds to repair the electric light plant.

Unionville, Conn.—The Unionville Electric Light & Power Company of this place has been incorporated for \$20,000, and will proceed at once to erect an electric light plant here for the lighting of the entire town of Farmington.

Warren, O.—A movement is on foot to establish a fourth electric light plant here. Warren capital is interested and a site is already under consideration. The plant will employ 100 men at the start.

Windfall, Ind.—A movement has been started to erect an electric light plant at this place.

Windsor, N. C.—R. C. Bazemore and associates will build an electric light plant.

Wyandotte, Mich.—There is talk of raising the price of electric light in this place so that the lighting plant may become self-supporting.

Street Railways.

Bordentown, N. J.—The Camden & Trenton Railway Company will furnish an electric sprinkler to lay the dust on the streets of this town during the coming summer.

Canajoharie, N. Y.—It is reported on good authority that a company will shortly be incorporated to build an electric line from Fort Plain to this place, thence to Sharon Springs.

Cardington, O.—The Marsfield, Cardington & Delaware Electric Railroad Company has been incorporated with A. A. Whitney president.

Carlisle, Pa.—Carlisle capitalists have organized the Star Traction Company with Jacob Foreman as president. It will build and operate a trolley line from this place to York by a route 20 miles in length.

Cleveland, O.—Announcement is made of the purchase by the Everett-Moore syndicate of all the street railway lines of Toledo, and other negotiations in progress, when completed, will give the syndicate control of all electric railways between Detroit and this city. Every electric railway in Northern Ohio and Southern Michigan will also be merged, with the exception of the Fomeroy interests, and the Little Consolidated Street Railway of Cleveland.

Clyde, O.—At a special meeting of the city council a franchise was granted the Sandusky, Clyde & Tiffin Electric Railway, which the promoters propose to build from Sandusky to Tiffin.

Delaware, O.—The Columbus, Delaware & Northern Electric Railway Company has purchased the Stratford paper mill, and will construct a \$90,000 power house.

Des Moines, Ia.—The Des Moines, Nevada & Eldora Electric Railway Company has been incorporated for \$50,000 by H. H. Polk, president, and S. Cassidy, treasurer.

Eau Claire, Wis.—A. H. Appleyard, owner of the Dayton, Springfield & Urbana, and two other electric roads in Ohio, and of the Eau Claire and Chippewa Falls lines, recently arrived in this city with Engineer, Alderman and Superintendent Hardigan for the purpose of making surveys and incorporating a company for an electric road between this city and St. Paul via Menomonie, Hudson and Stillwater, and work of construction will begin at once.

Galion, O.—This city will have two electric railways. The Ohio Central Traction Railway, which has been in operation between here and Bucyrus, will extend its lines to Crestline five miles north. The Mansfield, Crestline & Galion Railway has secured a franchise between the two cities and proposes to build a line

which will be part of the link to connect Cleveland and Columbus by an electric road.

Glen Jean, W. Va.—It is stated that Fayette County will probably vote in favor of subscribing \$50,000 to the stock of the company which proposed building an electric railroad between Fayette Station and this place. A. D. Preston, of Fayetteville, is one of the principal promoters of the line.

Milford, N. H.—Franklin Marden, president of the Mount Vernon & Milford Electric Railroad Company, is trying to arouse public interest in the building of the line which means so much for this section. Mr. Marden says if \$20,000 can be pledged in the towns of Milford, Amherst and Mount Vernon, he will guarantee the other \$30,000, which will make the capital stock complete.

Pontiac, Mich.—Messrs. J. Dean, O. Price and J. T. Morehouse, promoters of the proposed Detroit & Bay City electric road running by way of Pontiac, Lapeer and Caro have asked the Pontiac council for a franchise.

Sedalia, Mo.—The Railway & Electric Company of Sedalia has been incorporated for \$250,000 by W. B. Broomall, C. A. Duhring and L. Davis.

Toledo, O.—The Toledo, Fremont & Norwalk Electric Railway Company will build a branch to Gibsonburg.

Upper Sandusky, O.—Hon. M. A. Smalley and others are securing the right of way for an electric railway from Marion to Findlay through this city.

Manufacturing.

Dallas, Tex.—The Sutton-Steele Electrical Mining & Milling Company of this city, with a capital stock of \$100,000, has been incorporated to manufacture and sell such tools, machines and implements as are necessary to carry on a mining and milling business. H. M. Sutton, I. Jalonick, E. G. Steele and S. Leake are the promoters.

New York City.—The Automatic Bootblacking Machine Company of this city was incorporated a short time ago with a capital of \$2,000. The company proposes to manufacture machines for blacking boots by electricity. Ignatz Boskowitz, Albert Ulmann and Edward Mauelsdorf are all interested in the concern.

Company Matters.

Birmingham, Ala.—A deal consolidating the Birmingham Railway, Light & Power Company, the Consolidated Electric Light Company and the Birmingham Gas Company, arranged by Isidore Newman, of New Orleans; Harry M. Atkinson, of Atlanta, and the Old Colony Trust Company of Boston, was completed last week. The new corporation will have a capital of \$10,000,000.

San Gabriel, Cal.—The San Gabriel Electric Company has decided to increase its capital stock from \$500,000 to \$1,000,000.

Power and Transmission.

Appleton, Wis.—Mill Architect C. B. Pride, in company with a number of Chicago and Eastern capitalists, recently returned from the vicinity of Iron Mountain, Mich., where, it is stated, some deals are pending for the transmission of electricity from nearby water powers. It is understood that surveys of the water powers have already been partially completed, and that the deal involves the furnishing of light, heat and power to a number of towns and villages on the Menominee River in the neighborhood of Florence.

Automobiles.

New York City.—The firm of Palmer & Olson of this city has been organized to deal in electric vehicles and machinery with a capital of \$20,000. C. A. Olson and H. B. Palmer, New York City, and C. E. Francis, Brooklyn, are the parties interested.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 17@17½c.; Lake, 17½@17¾c.; casting, 16½@17c.

The Connecticut Legislature has passed a new corporation law which is similar to that of New Jersey.

All of the elevated railroads in Chicago report an increase of the June traffic over that of last year.

Toronto capitalists claim to have bought all the Twin City Rapid Transit stock not owned by President Lowry.

A dividend of 75 cents a share has been declared on Reading (Pa.) Traction stock, payable July 1, to holders of record June 25.

The United Traction and Electric Company of New Jersey has declared the regular quarterly dividend of 1 per cent., payable July 1.

Business failures in the United States last week numbered 179, against 162 the same week last year; in Canada there were 23, against 21 last year.

The North Jersey Street Railway Company will appeal from the decision which says that its right of way is taxable as real estate.

A Cleveland dispatch says that negotiations are in progress for the consolidation of all the independent telephone companies of the United States.

Nearly all of the Chicago Union Traction Company's common stock bought on the Chicago Stock Exchange last week has been taken up and will be shipped East.

It is reported that a group of New York capitalists is considering the construction of a trolley road 100 miles long through the center of the Wabash Valley in Indiana.

The Cataract Power Company, of Hamilton, Ont., has concluded negotiations with the Dundas Electric Light Company and will take over the business and right of that company.

It is said that Albert L. Johnson has obtained control of a trolley line running from New Brunswick to Keyport, N. J., which will be used toward completing his plans for a long distance trolley line.

The Westinghouse Electric and Manufacturing Company has declared the regular quarterly dividend of 1½ per cent. on its preferred stock, payable July 1. Books close June 22 and reopen July 2.

The Manchester Traction Light and Power Company controlling the electric light and street railway interests of Manchester, N. H., has declared its first semi-annual dividend of 3 per cent., payable July 15 to stock of record July 5.

The report that P. A. B. Widener, and William L. Elkins, are en route for home from London, in order to protect Philadelphia Union Traction interests, is denied. They are not expected home until late next month or early in August.

The General Electric Company is reported to have sufficient business on its books to keep all of its plants in full operation for at least two years. It is also reported that the matter of a 33½ per cent. stock dividend will receive early consideration.

The Mayor of Philadelphia has signed the local transit ordinances which had been passed through both branches of councils. They are now law, and the way is open to furnish Philadelphia rapid transit accommodation, which it greatly needs.

The Lancaster County Railway and Light Company has been incorporated at Camden, N. J., with a capital stock of \$2,000,000. The incorporators are Lewis Starr, Prosecutor of Gloucester County; Lindley M. Garrison and Assemblyman John G. Horner, of Burlington County.

Copper was very dull the past week and prices remained unchanged from the previous week. The exports showed a slight falling off from last month's business; thus far this month they amount to 4,274 tons. The production for May amounted to 22,392 tons, against 31,438 tons in April.

The following are quotations for some of the industrial stocks not quoted elsewhere: Electrical Lead Reduction, 3½@4; Electric Boat, 21@23; Electric Vehicle, 9@10½; Tel. & Tel. Company of America (full paid), 5@6; Electric Company of America, 8¼@8½; National Carbon, 15½@16.

Stockholders of the Boston Edison Electric Illuminating Company, who meet on June 24th to act on the merger with the Boston Electric Light Company, will also vote on the question of increasing the board of directors from nine to twelve members. Four Boston Electric Light Company directors will be added to the board should the increase be voted, as there is a vacancy in the present Edison board.

President Insull, of the Chicago Edison Company, says: "While our stock has been increased \$4,000,000, we shall issue only \$900,000 to stockholders at par about August 1. The other \$3,100,000 will remain in the treasury for use as the extension of business demands. This authorization gives the board of directors the right to issue new stock from the treasury at its option, but it will be put only on needed improvements."

Wall Street experienced a resumption of business activity last week, and at the close the outlook was much brighter than it has been for some time. The character of the trading left no room for doubt as to the professional control of the market. It was very evident that the public was disinclined to take any interest in the week's developments despite the uniformly good news, both at home and abroad, the daily announcement of which undoubtedly was the direct cause of the week's activity on the Stock Exchange. Nevertheless, it must be admitted that the present situation is much healthier and that there are brighter prospects than have prevailed for months.

ELECTRICITY.

VOL. XX.

NEW YORK, JUNE 26, 1901.

NO. 25.

ELECTRICITY

Published every Wednesday by the
ELECTRICITY NEWSPAPER COMPANY.

Publication Office, - - 136 Liberty St., New York.
Long Distance Telephone, 4081 Cortlandt.

SUBSCRIPTION RATES:

UNITED STATES, - - - - -	\$2.50
IN CLUBS OF FIVE OR MORE, - - - - -	2.00
FOREIGN COUNTRIES, - - - - -	4.50

EDITORIAL NOTES.

What Can Be Done With Wireless Telegraphy.

Some successful experi-
ments were recently made
in transmitting pictures
by wireless telegraphy.
Mr. Ernest A. Hummel's
apparatus and methods
were made use of, which were described in
detail in the issue of *ELECTRICITY* of January
5, 1898. As will probably be recalled, Mr.
Hummel's system consists in first tracing
through a carbon paper upon a metal plate the
picture to be reproduced. The lines thus ob-
tained are then brought out prominently by
means of some non-conducting solution, as for
instance shellac. This prepared picture is
then wrapped around a cylinder, against which
lightly rests a platinum point connected in
circuit. The receiver differs little from the
transmitter, except that in place of the picture
the cylinder contains a sheet of carbon paper
between two sheets of blank paper.

In the experiment in question, which was
conducted under the auspices of the N. Y.
"Herald," the transmitter was located at a
distance of fifteen feet from the receiver with
an eight-inch brick wall between.

As the transmitting cylinder revolved when-
ever the stylus touched the shellac it caused
the closing of the induction coil circuit, with
the result that an electric wave traveled to the
receiving apparatus, causing it to respond.
The greatest difficulties Mr. W. J. Clarke, who
was carrying on the experiment, had to con-
tend with were in overcoming vibration in the
registering stylus and in regulating the co-
herer to the precise degree of sensitiveness
necessary to secure good results.

Mr. Clarke also successfully tried the light-
ing of incandescent lamps at a distance, which
was accomplished by means of a mechanical
motor used in conjunction with the receiver
of the wireless apparatus.

A practical application of this device, which
Mr. Clarke predicts will surely come, is its uti-
lization for offshore lights and beacons in the
coast lighthouse service. By enabling an op-
erator to light or extinguish at will from a
point on the mainland lamps fed either by gas,
oil or storage battery at points offshore the
expense might be saved either of maintaining
an attendant constantly on duty at the light-
house or of constructing and operating a con-
necting cable. In the operating of what is

known as a flashlight the rotating mechanism,
Mr. Clarke contends, can be started and stop-
ped, as well as wound up, from a remote point
on the mainland.

Mr. Clarke, in conjunction with members of
the United States Lighthouse Board, has
already conducted interesting experiments on
a larger scale at Tompkinsville and elsewhere.

* * *

Trolley Roads as Realty.

The recent decision of
the Supreme Court of
New Jersey that trolley
car companies must pay
their full share of taxation for local purposes,
not only in cities but in towns through which
they pass, and in addition to the taxes now
imposed by the State for State purposes, gives
especial interest again to the question of
franchise taxation.

The issue before the Supreme Court was
raised by the city authorities of Newark, who
took the position that the right-of-way was
taxable, and levied an assessment accordingly.
The railroad company protested and appealed
to the State Board of Taxation which sus-
tained the appeal, and ordered the assessment
reduced, asserting that "the trolley company
had no greater right in the street than the
traveler upon it, on foot or in the ordinary
vehicle; and that it therefore had no taxable
interest in the soil of the street."

The case was carried to the Supreme Court
of the State, which, as stated, ruled contrary
to this. The court holds that it must consider
the distinction between the franchise of the
company, which is taxable by the State for its
own purposes, and the property acquired by the
corporation to enable it to enjoy its franchise.
Such property is under law taxable by the
local authorities. The court adds that the
relation between the trolley company and the
public is different than that existing between
the trolley company and the abutting property
owners along the trolley line. As between
Newark and the company, "the latter has ac-
quired the right to lay in the soil the founda-
tions for its rails, to lay rails thereupon, and
the right to the continuous uninterrupted
occupancy of such part of the public estate.
Its poles and its tracks are there permanently
to the exclusion of any other person that
might desire to occupy the land, and during
the life of the grant the city of Newark will
be without the power to remove them. The
company has a grant of a part of the public
estate at its own permanent, exclusive use,

and that is an interest in real estate; the part must be of the same character as the whole."

Regarding the contention of the State Board of Taxation, quoted above, the court says that the assertion that a trolley company has no greater privilege in the highways than other travelers is in conflict with the evidence of one's sense. The court then asks "if the trolley company has no greater right than an individual, why do not all persons have the same right as a trolley company without a special grant."

The trolley companies have determined to carry the case to the Court of Errors and Appeals, and it is said the contest will be far more interesting than that before the Supreme Court, as a brilliant force of corporation lawyers will make the arguments. If the decision is sustained the corporations affected—and it will mean the steam railroads, too—will pay very large sums annually in taxes that they do not now have to pay.

The Charleston Exposition. Some one has aptly said that international as well as local expositions are becoming more and more recognized as important factors in industrial progress and the advancement of civilization throughout the world, and that the interest, influence and possibilities of these enterprises have increased and expanded in all directions, thereby increasing knowledge, creating honorable competition in the various industries of the United States. This is especially true of the electrical industry, for with every succeeding exposition greater advances are being made in the electrical field and manufacturers are finding it profitable to display their products before the multitude of buyers who always attend expositions and who are ever on the lookout for something new.

Just one month after the close of the Pan-American Exposition another enterprise, known officially as the South Carolina Interstate and West Indian Exposition, will be opened in the historic city of Charleston, S. C. This enterprise has been projected primarily to show the industrial development and vast resources of the Southern States and the natural products of the West Indies, and to bring into closer business touch the countries adjacent to the southeastern seaboard. Manufacturers are reminded that through the instrumentality of this exposition a splendid opportunity will be offered to extend the industrial and commercial relations of the United States so as to add to the territory already tributary to our manufacturers a still greater proportion of the West Indies and the Central and South American republics. These adjacent countries, with a population of over 50,000,000, offer an inviting field for the exploitation of American electrical machinery and appliances. Hitherto, Europe has had a large share of the trade of these countries, but the time has come to demonstrate that the ports of the southeastern states are the shortest and most direct, and therefore on the natural routes of commerce between all these countries of the Western Hemisphere and the interior states of the Union, and that by using these ports the manufacturers of the United States can compete with the whole world and secure pre-eminence in the commerce of the American continents.

Electricity will play a prominent part in this exposition, which will open on December 1,

1901, and continue until June 1, 1902. In the department devoted to electricity will be shown a complete display of electrical vehicles. A feature of the exposition that cannot fail to interest thousands of people will be a demonstration of the uses of electricity in the arts and methods of employing electricity in the household. Electric boats will ply upon the superb water-ways through the exposition grounds, and what is said to be the largest chime of bells in America will be run by electricity. To furnish power for operating purposes, a power house and generating plant will be erected between the transportation and machinery buildings, and a pumping station will be located close to the river front at the extreme northwest corner of the grounds. Electric light and power will be obtainable in all the buildings of the exposition and live exhibits in active operation will also be placed in every building.

Of late years, the South has rapidly come to the front as a manufacturing center and the use of electricity for various purposes is growing with equal rapidity. A good showing at this exposition by the electrical industry should be marked by still greater advances.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

MR. W. S. BARSTOW, general manager of the Edison Company of Brooklyn, has resigned.

A FASHION has been introduced in France of inviting friends to attend the christening of a new automobile.

GEN. A. W. GREELY of the Signal Corps is on his way to the Philippine Islands to inspect the submarine cable system and telegraph lines there.

LAST week the Lorain, O., Street Car Company put a three-cent fare in operation. The reduction from five cents is in the nature of an experiment. This is the first electric road in Ohio to carry passengers for three cents.

THE Technical School at Atlanta, Ga., is to have a new electrical laboratory.

A CABLE dispatch says that the General Electric Company has purchased the controlling interest in the British Thomson-Houston Company, which holds the exclusive rights in Great Britain for the Edison, Thomson-Houston and other patents.

WHEN the \$3,000,000 passenger station, that will be built in Chicago by the Vanderbilts, is completed, trains will be hauled in and out of the city by electric locomotives.

AT the recent session of the General Assembly, in Connecticut, not less than fifty special acts relating to street railways were passed. A large number of interurban trolley lines will be built.

THE New England Butt Company of Providence, R. I., has a new rotary machine for polishing electric cables. It is so designed that the pressure can be increased or diminished and has the advantage of enabling the operator to apply harder pressure than is safe when the machine is stopped. Speed also can be in-

creased and one machine can be used on various sizes of cables, while a second coating may be applied to the cable while it is being polished.

ACCORDING to a recent report from Paris the new French submarine boats building will be furnished with double motors—steam and electricity—similar to the fittings of the Holland, thus increasing their sphere of action and enabling them to plunge quicker than the Narval. The latter's recent experiments were unsatisfactory. The crew suffered greatly, and navigation on the surface was also defective.

REPORTS of dividends actually paid show that mining is the most profitable of all industries. Under the great improvements recently made in both air and electric drills, and the reduction of the cost of treating the ore by chemical processes, the large dividends already paid will be greatly increased. The waste dumps thrown away at the mines and mills a few years ago are now frequently treated at large profits.

A DISPATCH from Berlin says that experiments were made on Saturday with a new electric engine on the Berlin-Zossen Railway. The results justify the hope that it will be possible to make 200 kilowatts (142 miles hourly with the new engine.

H. A. EVERETT of the Cleveland Electric Railroad system will soon own the finest trolley car ever built. Exclusive of its costly furnishings, the car will cost about \$15,000. It will contain a parlor, library, workroom, dining room and kitchen, and it will also be fitted with three sleeping berths. The latter will be invisible during the day, because they will be stored beneath the floor of the car, not above, as is usual in most sleeping cars. The car will be nearly twice the length of the ordinary trolley car. At either end there will be an electric searchlight. The one at the rear of the car, being red, will turn on automatically whenever the car stops.

ACCORDING to a foreign contemporary the great Berlin Tramway Company offers prizes of 3,000 and 1,500 marks for the best speed indicators suitable for use on their tramways. Particulars of the conditions of the competition, and as to the additional royalty that will be paid by the company to the owner of the successful instrument, may be obtained from Die Direktion der Grossen Berliner Strassenbahn, 218 Friedrichstrasse, Berlin, S. W.

IN the immediate future there will be installed at the Illinois Central's fruit wharf, in New Orleans, La., by the United Fruit Company, an apparatus operated by electricity that will almost automatically unload the fruit vessels that bring their cargoes to that port. The machine is the invention of a Philadelphian, S. J. Sidney, and it will cost in the neighborhood of \$35,000 to erect. It will save nearly this much in the handling of bananas alone in a year, and will revolutionize that part of the fruit business. Incidentally it will dispense with the greater part of the Italian labor employed on the wharf. Now it costs the fruit importers 2½ cents a bunch for the handling of bananas. The machinery will cut this to 1½ cents a bunch. Last year 3,000,000 bunches were handled at this wharf, and the prospects are that the imports next year will be much larger. For the privilege of allowing the Unit-

ed Fruit Company to place in position this money saver the Board of Commissioners of the Port of New Orleans will receive \$600 the first year of its operation and \$1,000 each succeeding year.

EUGENE CHAMBERLAIN, Superintendent of the Equipment Department of the Brooklyn Rapid Transit Company, has invented a trolley car that he believes solves the problem of comfortable surface transportation. The seats are chairs of the type introduced on five cars put into commission on the road, but in this latest car Mr. Chamberlain has carried the idea further. Instead of being fixed in an immovable position the seats are arranged in pairs and are operated eccentrically from a base near the wall, one chair being directly over the base and the other at the end of a strong iron member, which revolves from the base center.

NOTICE has been given by the British Embassy in Washington, D. C., of an important test at which it is expected American inventors will enter next December, of horseless vehicles for the British army. These prizes of \$2,500, \$1,250 and \$500 are offered by the British War Office for three self-propelling "lorries" best suited for military requirements. The "lorry" is a vehicle for the transportation of freight, and is of a special pattern to facilitate the handling of merchandise of all descriptions. The vehicle is to be capable of use on rough roads and to a limited extent, across country; to have a capacity of three tons on the lorry and two tons on a trailer. The maximum speed is to be eight miles per hour, and the driving wheels must not be less than 9 inches across the tires. No restriction is placed on the kind of fuel or class of engine, steam, internal combustion or otherwise. War Department officers who propose doing something in the same line believe the question is entitled to a great deal of consideration. The few horseless carriages the army now uses, have been performing good work, but there is reason to believe that they should be of a different type and better adapted for army purposes.

THE new electric elevator in the Washington, D. C., Monument was tested last Thursday for the first time since its installation. For two weeks it will make many trips daily to the top of the great shaft, weighted with 5,000 pounds of sand. If it continues to make the trips without accident at the end of the fortnight, it will be opened to the public and visitors will no longer be obliged to climb the thousand steps to reach the top. The new lift is a handsome bronze trimmed cage, fitted with leather cushioned seats for thirty passengers. It has a counterweight of 8,000 pounds, so that considerable more power is required to bring it to the earth than to raise it to the top of the monument. The best safety devices known are provided, and unless all six of the strong steel cables should break at once, an almost impossible contingency, a serious accident is out of the question.

THE French Government has appointed a commission to study the possibilities of using the earth's strata, instead of air, for transmitting messages by wireless telegraphy, M. Villot, inspector-general of Posts and Telegraphs in France, and head of the commission, said in a recent interview: "Aerial wireless

telegraphy cannot give entirely satisfactory results, as experiments have been proved to vary with the atmospheric conditions. Furthermore, the horizon remains an insurmountable barrier for long-distance messages, even with relays. On the contrary, certainty can be obtained in pouring into known subterranean layers sufficient power to reach a desired point, where perfected apparatus will receive the message. The first duty of the commission will be a thorough study of the earthly strata, which the latest geological researches have shown to be imperfectly understood."

THE *Lucania* of the Cunard line, which reached this port last Saturday from Liverpool and Queenstown, experimented with the Marconi system of wireless telegraphy on her voyage over. Going down the Mersey she exchanged aerial greetings with the British schoolship *Conway*, which is equipped with the Marconi apparatus. She also swapped salutes with wireless telegraph stations on the Irish coast, and while at sea swapped sentiments with the Elder-Dempster liner *Lake Champlain*, also fitted with a wireless system of communication. Many passengers sent messages to their friends ashore by way of stations on the Irish coast.

THROUGH what appears to be an official statement, it has been learned that the Brooklyn Rapid Transit Railway Company intends spending at least \$3,000,000 for improvements on the elevated and surface lines. A detailed statement of how the money will be spent reads: A power house at Third avenue and First street, \$308,305; equipment for this plant, \$1,283,470; subways for feed wires, \$533,071; tracks and roadways, \$173,128; engines and generators, \$600,000; new construction, \$285,000. Grand total, \$3,182,974.

THE question of providing the British cavalry in South Africa with remounts has apparently had the effect of sharpening the wits of some of our legislators, says the "Electrical Engineer," London. In the House of Commons, for instance an hon. member hit upon the brilliant idea of substituting motor-cars for horses, observing the while that they could go into places where horses could not proceed, that they could move faster and carry heavier goods. A charge of cavalry mounted on motor-cars would certainly be something more than unique, and the spectacle of mounted Boers being pursued over kopjes by motor-cars brought forth some jocular remarks from the members assembled. Later on, however, it was stated that the Government is alive to the importance of motor-cars for transport purposes, and is now conducting experiments with a view to their utilization in the army.

Convention of the Association of Railway Telegraph Superintendents.

The annual convention of the Association of Railway Telegraph Superintendents opened in Buffalo, N. Y., at Statler's Hotel, near the Exposition grounds, last Wednesday, with about 150 members of the Association in town for the first day's session.

W. F. Williams of Norfolk, Va., president of the Association, called the convention to order at 10 o'clock. The officers and various committees submitted their reports and they were accepted and then various matters of especial

interest to railway telegraphers were taken up and discussed.

Among the papers read were the following: "The Application of Storage Batteries to Railway Telegraph Service," by W. E. Athearn of New York; "Rapid Telegraphy," by Walter E. Phillips of New York, in whose absence the paper was read by John Ghegan of New York; "Cipher Code for General Railway Telegraphy," by C. S. Rhoads of Indianapolis; "The Voltaplex," by Charles Selden of Baltimore; "The Inefficiency of the Ordinary Operator and How to Remedy It," by A. R. Swift of Chicago.

The following officers were elected: President, C. F. Annette of Chicago; vice-president, F. P. Valentine, Boston; secretary and treasurer, P. W. Drew of Milwaukee.

The Association chose Boston as its meeting place for next year.

LONDON NOTES.

(From our London Correspondent.)

English Municipal Electrical Engineers in Convention.

Members of the Municipal Electrical Association betook themselves to Glasgow for the opening of their annual convention on June 19. The president for the year is Mr. W. A. Chamen, the chief engineer of the Glasgow Corporation Electricity Supply Undertaking, which has recently undergone such large extensions. His presidential address was followed by the reading of half a dozen papers on matters of pressing importance to municipal electricians, these being distributed over the three day's proceedings. The topics selected were:—(1) Uninsulated Returns in a Tramway System; (2) Street Electric Lighting; (3) Braking Apparatus for Electric Cars; (4) Equitable Allocation of Costs in Combined Lighting and Traction Stations; (5) Refuse Destructors in Combination with Electric Power Stations; (6) Coal and Ash Conveying gear. Anyone who has recently followed the course of events in connection with municipal electrical works in England will at once recognize in these subjects matters which are uppermost in the minds of borough electrical engineers and electrical committees.

Institution of Electrical Engineers.

The Institution has now finally elected its president for the year in the person of Mr. W. Langdon, whose work in connection with the applications of electricity to railway working dates back many years. The list of awards for papers read at meetings held during the past year has been issued. The awards vary in value from £5 to £25, and the papers are: "Insulation on Cables," by Mr. O'Gorman; "Rapid Variations of the Current Through the Direct Current Arc," by Mr. W. Duddell; "Notes on Polyphase Sub-Station Machinery," by Mr. A. C. Eborall; "Storage Batteries in Electric Power Stations Controlled by Reversible Boosters," by Mr. J. S. Highfield; "Method of Compensating Voltmeters for Voltage Drop in Large Feeders," by Mr. M. B. Field; "Polyphase Equipment of Factories," by Mr. W. Wyld; "Electrically-Driven Machine Tools and Their Advantages," by Mr. G. Ralph; "A Watt-Hour Meter," by Mr. F. Holden.

Electric Traction on the Underground.

The latest information about this matter is to the effect that a new company has been formed to carry out the electrification. It is called the Metropolitan District Electric Traction Company, and will lay the permanent way, provide new rolling stock, and erect the necessary power station at Lot's Road, Chelsea. "Undecided" is still the only news available regarding the electrical system to be employed.

ON ANODE RAYS.*

BY W. HIBBERT.

About three or four years ago, Dr. Gladstone and I conducted some researches on the absorption of X-rays by various salts and metals. The experiments were very numerous and involved the use of many tubes, so that incidentally a great variety of observations were made. In some cases, pure accident led to some notes about anode rays which may interest your readers. M. Sagnac has given some account of similar results.

The X-ray tubes employed were of the well known form shown in the figures, the bulb being about 2½ in. in diameter, and the distance from the aluminum cup to the platinum plate about 1½ in.

For the benefit of those who are less familiar with the subject, it will be convenient to describe the appearances observed during the process of exhausting these tubes, when an electric discharge from a coil is used. At a pressure which is relatively great, light appears around the cathode cup (Fig. 3). With increasing exhaustion this light spreads more and

more till a converging beam forms. The focus of this cone has a very considerable depth, but divergence over a large area follows (Fig. 2). As the pressure still diminishes, the divergence cone narrows, until it all falls on the flat platinum plate. At still further exhaustion these cones disappear, and the greenish-yellow light which indicates the X-ray stage fills the whole space intervening between the electrodes. At various stages, the platinum plate (anode) is observed to get red hot, which is explained by the action of "cathode rays" from the aluminum cup bombarding the plate on which they are focused, raising its temperature by delivering up to it the kinetic energy they possess.

While at work on these tubes, I had the good fortune to see the result of an excessively small puncture, so small, indeed, that the normal pressure was not restored in six hours. The main effects observed were the reverse of those just described as occurring during exhaustion. The greenish-yellow light disappeared; the fairly concentrated cones were followed by the more diffused; and after a little while, light could be seen round the aluminum cup only.

In this deteriorating vacuum I happened to reverse the current, just after the cones had disappeared, and the focus was becoming in-

definite. The aluminum cup thus became an anode, and the platinum plate a cathode, contrary to the usual practice. To my surprise, the platinum cathode became red hot, and continued so during the discharge. Even when the battery was switched off, the incandescence was visible, dying away in a manner observed after bombardment by cathode rays. The current was reversed six or seven times, and each time that the platinum plate was acting as cathode it became red hot, though this was not observed when it was made an anode.

It is now granted that the ordinary incandescence of an anti-cathode, or anode, is due to bombardment by "rays" from the cathode. Parity of reasoning suggests that at the particular pressure reached in the experiments just described the cup-shaped aluminum electrode can radiate anode rays more energetically than cathode rays.

As the leakage continued and the vacuum deteriorated still further, the visible heating of the platinum plate (cathode) diminished and finally ceased. But heating continued for the bulb was found to be warm over a considerable area near the cathode. At a pressure at which the discharge showed light just round the alu-

and irregularly distributed till a much lower pressure is increased. The bombardment is then concentrated on the cathode as described raising it to incandescence. The pressure at which this was obtained was proved in various experiments to be just higher than that at which the "focus" becomes visible. In some experiments the platinum was seen to heat first at a point or a very small area, recalling the experimental proof given by Mr. Campbell Swinton of a focal concentration continuing to the anode. Here, of course, the continuation is to the cathode.

These results seem to indicate that during exhaustion of a tube there are both anode and cathode rays, that the line of discharge and concentration for each varies according to the pressure, and that at particular, though different, pressures, it is possible to get convergence of either.

BECKENHAM ELECTRICITY WORKS.

BY FRANK C. PERKINS.

Among the London and Greater London stations recently constructed and now in operation there are several which are of interest to engi-

BECKENHAM ELECTRICITY WORKS STATION.

minum cup as cathode (Fig. 3), the current was reversed, and the heating effects were greatest at A A, falling rapidly in front to a a, and less rapidly behind to a₁ a₁.

I now tried to obtain evidence of this anode radiation, and consequent incandescence of the cathode, during the process of exhausting a tube. Putting a tube on to a Cossor pump, and running steadily until an ill-defined "focus" appeared between the electrodes (the discharge being in the usual direction—aluminum as cathode, platinum as anode) the current was reversed, and at once the platinum plate began to glow. Here again the anode radiation or discharge is more energetic than that from the same end used as cathode.

Some observations were made during the process of exhaustion by touching different parts of the glass globe. Heating effects were observable over a wide range of pressure, and as soon as the vacuum became fairly good, the temperature was higher round the cathode than near the anode. It is, however, widely

neers in this country and well worth considering at greater length than is possible in a short descriptive sketch. The electricity works of the Beckenham District Council began operations last fall on November 23. The engineer-in-chief is A. J. Hedgecock and the consulting engineer R. P. Wilson. The station is located at Arthur-road, Beckenham, England, and cost nearly \$200,000, of which the buildings with the destructor cost \$60,000 and the machinery, mains and transformers \$125,000.

The system used is an alternating one, the frequency being 50 cycles; a three wire net work is employed, the transformers being placed in nine substations located above ground, and converting the current from 2,000 volts to 400 and 200 volts.

The boilers are three in number, each evaporating 3,700 lbs. of water per hour at 160 lbs., and were constructed by the firm of Babcock & Wilcox. The engines are of the Baliss and Morcom compound type, two having an output

*From the "Electrical Review," London.

of 200 hp. each and one of 100 hp. capacity. The engines, as noted in the accompanying illustration, are of vertical construction and are each directly coupled to alternators of Fowler & Co.'s design, two being of 120 kilowatts and one of 60 kilowatts' capacity.

The speed of the larger sets is 380 revolutions per minute and the smaller outfits run at 500 revolutions per minute, generating an alternating current of 2,000 volts at 50 cycles per second.

The mains were supplied and laid by the B. I. W. Company, of Prescott, Lancashire, and are concentric cables, lead covered, and laid in earthenware troughs filled in with bitumen.

The public lighting is done by 18 ampere arc lamps in parallel on 200-volt circuits, while the incandescent lighting is operated on the three-wire system, 8 candle power lamps being largely used, a total of 13,500 lamps being connected up May 1, 1901.

BECKENHAM ELECTRICITY WORKS ENGINES.

Thompson-Houston meters are used and the price per unit is 6d. for lighting and 3d. for power service, the price of gas in the district being 2s.10d. and supplied by two local companies.

This station is used in conjunction with dust destructors. They were built by the Horsfall Destructor Company of Leeds, and consist of three cells, each capable of destroying 10 tons of refuse per day, and when working at full power will generate steam enough for a load of 60 kilowatts.

The Green economizer is of the 96 tube type. Natural draught is used, but a Horsfall steam jet is employed for the destructors. Hand stoking is employed and Evans ram pumps are used, the water supply being from artesian wells and also from town water. The free wiring system is utilized at this plant.

Recent news from San Francisco, Cal., states that at the regular monthly meeting of the board of trustees of the Chamber of Commerce the proposition of establishing a Marconi wireless telegraph system to the Farallone Islands was brought up for discussion. The board finally decided to confer with the United States Weather Bureau in the matter.

BELL METHODS.*

BY E. B. FISHER.

I do not expect or hope to say anything startling or novel. Most of you already know all that I shall mention this morning—have had experiences and observations similar to those mentioned; but to recall them may induce the presentation of other and really new experiences, and may prove an encouragement or a suggestion to those just entering or about to enter the Independent telephone field. The man or corporation that should ignore competitors, that fails to study their mutual condition, and profit from them, could not expect to succeed in competitive enterprises and efforts. The man or corporation that maliciously or falsely discusses a competitor and its business in the hope that thereby its own business may be benefited makes a grievous mistake, and in the end loses more than is expected to be

rather than from profitable observation of what had already been "threshed out" in the evolution of the Bell system. It is highly essential, now that the Independent systems are becoming larger, more complex, and intimately related with each other, that thorough system shall obtain; that first-class construction shall be the rule rather than the exception; that uniformity of practice in the manner of toll service, in the division of revenue arising therefrom shall obtain; that those conducting the business shall exchange experiences, thus enabling all to learn of mistakes and avoid them, and to secure the advantages of improvements that may be devised. The exchanges of the Bell Company throughout the country have for years enjoyed the interchange of opinion and experience, and through the manifest advantages of such interchange have avoided many difficulties and secured many betterments. We can and should copy this feature. We should meet each other frequently, individually and collectively, and should keep in touch with each other by correspondence as well as over the wires—when we hear of a good thing, let our neighbors know of it; when we discover perils or uncomfortable conditions, warn our friends. The Bell, in a sense, although composed of many subordinate companies, have been one family. We can retain our individuality, maintain our ambitions to be the first in our chosen sphere of action, and still remember that we are a part of a family. Some have been inclined to suggest that our friends of the Bell Company had too much system. As the business develops it begins to appear that too much system is less expensive and less foolish than too little. If the managers and operators of Independent plants shall more carefully and fully analyze the cost of conducting their business in the different departments and the results therefrom, many errors will be avoided and the ledger balance on the right side will unquestionably grow. In systematizing business, we have much to learn from Bell methods. We should gain this knowledge and improve on it.

It is undoubtedly true that the conduct of a monopoly often results in somewhat of arrogance on the part of those who are at the head of such monopoly, or who hold responsible positions in the management of its business. Such people naturally come to feel that they can do about as they please, and if patrons or the public are not delighted therewith, what odds. I have heard gentlemen, who are listeners to this paper, more than once offer the suggestion that they would not care for the service of certain Bell employees who had applied for positions, because they were too "cranky." We can see for ourselves how natural it was that crankiness grew upon many officials and managers of Bell plants. They were not obliged to consult the wishes or desires of the public to secure their business and profits. One could take telephone service on their terms or let it alone. That was all there was of it.

This spirit of crankiness, so natural under the circumstances which engendered it, is the exponent of general conditions which produced other peculiar manifestations often noted the past few years. We should carefully consider these manifestations which are intended or expected to affect our own business, and, by interchange of observations or experiences, help each other and counsel or warn those who are about to engage in the Independent tele-

*Paper read at the meeting of the Independent Telephone Association, Buffalo, N. Y., June 18, 1901.

phone business. I well remember when, a little more than six years ago, we began canvassing in Grand Rapids, Mich., to secure the money with which to build the plant of the Citizen's Company and for patrons of the same, the many stories which were afloat among our people as to our business. It was confidently asserted by representatives of the Bell Company in our city and State that we never would build a telephone plant, indeed, that we had no intention of so doing, and were only trying to make money by being bought out. We were, in effect, intimidated, intending blackmail. It was said that we could not build, could not get material, could not properly combine the material when we got it, could not find apparatus that was not infringing, could not get a switchboard that would work, would not know enough to set poles, string wire thereon and make them stand up. Even after we had actually begun to install telephones, those who had given us contracts were prompted to bet that we never would give service. There were infringement suits, which may have been really expected to put a quietus on our enterprise, but these did not any of them succeed—it scarcely seems possible that some of them could have been expected to.

We have been giving service for more than five years, and the company which was then organized with but \$100,000, authorized capital, has grown until it has to-day more than one-half as many telephones as the Bell had in the entire State of Michigan but five years ago, and has an authorized capital well toward one-half what the Michigan Telephone Company then had. And yet to-day similar predictions and commentaries upon like enterprises, even in Michigan, as well as other States, are indulged in by our neighbors. Officials of the Erie Company have informed the public through the press within a few weeks that the new Independent plant will never be built in Detroit; that the People's Company in that city never will give service. When, in your respective localities, the Bell resorts to such methods to dissuade the public from patronizing them, to persuade them that you are not intending genuine business, you can comfort yourself with the fact that you are not singular in this experience, and you can point to results in other localities and say to your friends, "It is an old story, and no truer here than it has been elsewhere."

If you get started with service and you find that your patrons receive circular letters suggesting that the Bell is owner of letters patent "steep hundred thousand and steep," and that all who use the Independent apparatus infringe such letters patent and are liable to prosecution for using the same, do not flatter yourself that in this method the Bell Company is distinguishing you beyond other Independent companies. Such things have been done repeatedly. You have yet to hear of a subscriber who has been so prosecuted, and you can very safely guarantee your patrons against any damage that may be awarded by any court under such suits, and that you will pay all costs for defense. If you should find that the Bell Company, which has frequently informed the people in your community that its former rates were the lowest they could afford to make for its service in your locality, has, upon the development of your competition, resorted to free service, or much less than cost rates in an effort to destroy you, do not be fearful that such practice can really damage your company;

do not imagine that you are enduring an experience novel in the telephone business. No, not for a minute, when the Bell resorts to this method attempt to meet competition by establishing like rates, or lower rates, for your own service. Begin the education of your people, take them into your confidence, tell them the truth about your business and its results; insist upon a fair profit, upon reasonable returns on the actual investment, after giving good service, and you will find the people ready to pay your price rather than to get absolutely free service from the competitor. Do not resort to other tactics, because there can be but one result from such procedure. This Bell method is a "war measure," pure and simple, and if it could succeed would be followed by such advance in rates as would fully compensate that company for the temporary concession of free service or less-than-cost rates. This fact has but to be stated to intelligent business men to be apparent to them, and to influence their action. This method, which has been practiced by the Bell subordinate companies in considerable regions of the country, so far as I know, never yet has succeeded in taking away the patronage of an Independent company honestly striving to give good service at a reasonable rate. The company which shall reduce its rates below a reasonable point in a struggle with the Bell Company is doomed the moment it shall do so.

What do you think of party-line service? One of the methods of the Bell Company, in its efforts to meet the lower rates of Independent telephone companies, has been to introduce, quite largely, party-line service with important reductions in rates for such service. Has it been successful where you have observed it? Is it a serious menace as a competitor? Of course, we know that the new president of the Central Union and the Chicago Telephone Companies, who still retains his position at the head of the Pacific Coast Company—all Bell—is a staunch advocate of this sort of service. He is a gentleman of extended experience and wide observation in telephony, and for that reason his opinion is not to be lightly dismissed or treated with indifference. We are this morning discussing Bell methods in the hope that we may learn from them and profit from either accepting or avoiding their example. My own observation has been that party-line service is largely "a snare and a delusion," where given in city exchanges, and is not a competition that we need fear. It is evident that no devices have yet been invented which will permit more than two parties to use the same line at the same time, so when any pair on a party-line holds the line, others must wait. Should this sort of service be generally used, the difficulty of securing your own line and of getting connections with other parties on similar lines is manifestly very greatly increased. We all know how impatient the average telephone user is to get service the moment it is wished—you have known subscribers ready to swear that the girl kept them waiting two minutes for a connection when it was not to exceed 20 seconds. I do not believe that you will be compelled to resort to party-line service to meet this method of the Bell competition. The B. W. C. service, which was expected to work wonders three or four years ago, is not very generally popular.

No discussion of recent Bell methods would be useful if we did not consider minute rates

for toll service. What is your observation on this topic? The high authority from the Pacific Coast who is trying to stifle competitors in the Central Union territory and to prevent it in Chicago, who is indeed regarded as a possible head of the American Telephone and Telegraph Company, is the father of the minute-rate service. He sets great store by his scheme, and has secured its adoption in considerable territory outside of that which he controls. We, in the Michigan territory, find it one of our competitions, and have not quite made up our minds as to its present and probable effects. However, on general terms, it is fair to state that it is causing considerable friction and dissatisfaction. The average telephone user is ready to affirm that he has not used the service so long as he has been charged for. He considers himself a victim of overcharge and believes that the minute-rate is intended to thus increase the fees of the telephone company which he was inclined to believe were already quite large enough. If the average business man, on a long distance connection, can actually accomplish his conversation in a single minute, it strikes me that at the price for one minute's connection, the line cannot earn enough, for we all know that quite as much time heretofore has been spent in getting two parties to talking as is occupied with their conversation. Now, if the time for securing connections cannot be reduced and the time of using is reduced, with theoretical reduction of pay, service would be less profitable to the companies than on the three or the five-minute basis. If the average subscriber is expected to use the line on a three or five-minute basis, why not make rates upon that theory? That would be fair to both companies and patron, and secure the desired revenue, even if but one minute should actually be used. The purpose of this paper, as before intimated, is to set you to talking about your mutual experiences and to induce discussion rather than to state conclusions.

In Michigan our neighbors have taken a new departure within the last few weeks. Formerly, they refused to admit that any other apparatus than the Bell could be successfully used in telephone service. The sub-companies of the parent company were supposed to have a hard and fast contract forbidding the use of any other apparatus, and forbidding connections with any other apparatus. Lately the Michigan telephone companies have been attempting to secure, in a few instances, toll line alliances with companies formerly built and still continued, as far as exchanges are concerned, as Independent companies. The Michigan company has said, in effect, to such companies: Keep your local exchanges, even your own toll lines; take control of the exchange business in your locality, but enter into a contract for toll connection outside your territory through the Bell system. It will give you equal percentages on originating business to those you have heretofore enjoyed, and provide you with more extended and superior toll line facilities. This late Bell method is insidious, and it is not strange that in some cases it is successful. Where such a contract is made exclusive—and, of course, they try to make it exclusive if possible—it subtracts by so much from the efficiency of adjoining or neighboring Independent service. So anxious has the Michigan Telephone Company become in this matter, I believe it is true that it has been willing to make arrangements in some cases

for a divided toll service where it was impossible to secure an exclusive contract. This Bell method is one of the most threatening efforts yet made, and yet has its silver lining. The strong Independent companies, with considerable toll line facilities which have been growing, have not been influenced by such propositions. Only the smaller and weaker companies have made such contracts with the Bell Company. Of course, no other Independent company has been willing to parallel the lines of a neighboring Independent company, no matter how inferior might be such neighboring plant, or how imperfect its service. Now that sort of territory will be provided with up-to-date Independent plants. This recent manifestation would seem to indicate that the parent company must have consented to an abandonment of the exclusive feature of its contract with subordinate companies.

I believe that the Bell habit of ignoring the farmers—the small villages and the country—has been an error. I think that in this department of telephone service, a proper development of party lines may be made with great advantage to the communities served and at fair profits to the investor. There are regions in Michigan—and probably each of you could repeat the same tale—where the Bell is beginning to compete with Independents in their own field in this regard. I say their own field, because the Independents were the first to deliberately provide this sort of service. This Bell method of following a good example may prove a formidable competition, and may materially strengthen their smaller exchanges and their situation if they shall first enter new territory with this sort of service.

There was a time when I think it was actually believed by the average general manager or prominent official connected with the Bell telephone companies that an Independent company could not possibly secure intelligent, experienced employees. They thought that we would be compelled to go through the process of evolution which was so tedious and so costly in the earlier days of the Bell Company; that their employees would remain with them. They even thought in some localities that an Independent company would not get exchange operators, and in some instances employed superfluous help simply to keep them from entering the service of Independent competitors. Some know more to-day on this topic than they did a few years ago.

A large number of the brightest men in telephony have found employment in the independent field, and there is scarcely one in this Convention Hall who has not had frequent opportunity to secure many more of the most important employees of the Bell Company than he has had places for. We have been surprised at times at the seeming lack of loyalty to their employers by those who have been so long on Bell pay-rolls. Perhaps a little analysis of Bell methods may explain this situation and furnish a warning for ourselves. The rewards among the employees of the Bell heretofore have not been great either in salary or opportunities. They have been made to feel more like machines than human beings. In many cases they have not had their inventive tendencies encouraged by proper compensation for what they produced; indeed, they have been compelled to part with their inventions on the theory that their brains as well as their labor belonged to their employer, or because

there was but one market for their invention and devices. That market could set its own price upon what it bought. Such conditions are not conducive to loyalty, or to inducing energetic service. The Independents, if they shall copy Bell methods in this respect, will make a grievous mistake. If you should wake up some fine morning and hear that you have sold, or are about to sell, your telephone plant to the Bell Company do not consider that the transaction is necessarily closed. If you hear similar reports as to actual or impending sales of other Independent companies in your own or other States, be not disturbed thereat, nor convinced that the news is reliable. There have been some such sales, but vastly more rumors of those which never have occurred and do not seem likely to. There have been methods in these rumors. For some reason, some interest, evidently not Independent, has believed it desirable to circulate such reports, probably in the hope that other Independent interests might be disquieted or discouraged, and yield more readily to apparently advantageous offers. These methods have been relied upon to produce serious effects. Keep yourself and your neighbors advised of the strength and growth of the Independent movement, of the strength of their own situation in competition, and fewer such rumors will be verified hereafter.

In nothing that I have said thus far have I given many of you real news. As I said to one of my friends, I felt that it was impossible to do so, and was almost ashamed of having tried to prepare and read such a paper; but if it shall refresh your memory, if it shall induce you to give other experiences and observations of your own; if it shall attract, through publication in our annual reports or otherwise, the attention of any who are about to engage in the telephone business, and shall hearten and strengthen them in their enterprise and efforts, it may accomplish some of the good earnestly desired and intended in the preparation of the paper. As stated at the outset, it is not in criticism or derogation of the Bell Company that is offered. That corporation has the right to resort to any efforts within the bounds of fact, it may choose to make, and we have equal right to discuss its methods and by considering them, minimize their effect, if not entirely to overcome them.

A NEW PHONOGRAPHIC PRINCIPLE.*

BY W. NERNST AND R. VON LIEBEN.

As is well known, the Poulsen phonograph has in recent times excited well deserved attention, not only because of its absolutely pure reproduction of human speech, but above all because of the originality of the idea on which the apparatus is based. Instead of employing, as Edison did, soft masses to fix the tones by means of mechanical deformations produced by the sound waves, Poulsen uses the magnetic effect of the microphone current upon a magnetically-deformable substance—steel. It is evident that one can, in general, employ on the phonographic principle any process which will produce a lasting change proportional to the corresponding action of the voice. One might conceive an electrification of insulators (which would be, so to speak, an electrostatic analogue to the Poulsen electromagnetic ap-

*Translated by the "Electrician," London, from the "Zeitschrift für Elektrochemie."

paratus), a photo-chemical process, etc. The electro chemist will, in the first instance, however, bethink himself of the permanent change which an electric current produces in an electrode, i. e., galvanic polarization. The following experiment may therefore be made (Fig. 1): An endless belt of platinum runs over two rollers, and is continuously moved by a motor and polarized by a microphone current. As a necessary condition is that the variable polarizations produced by the current variations must be separate from one another in position, the platinum belt must move with considerable speed on the one hand, but on the other hand, the contact surface between the belt and the electrolyte must be as small as possible. The latter condition is sufficiently fulfilled if one employs as an electrolyte a wooden wedge which is saturated with a conducting liquid held in a glass trough provided with an electrode. In the figure, M is a microphone which is connected in the primary circuit of a transformer, in which circuit are also five accumulator cells. S is the secondary coil of the transformer. For receiving the record the throw-over switch W connects the apparatus with S, and for reproduction connects it to the telephone T. B is a battery of variable pressure which can, if required, be connected in the circuit. The experiment succeeded

FIG. 1.

completely. One heard a more or less clear reproduction which could be repeated several times before the volume of sound had noticeably diminished.* However, the quite unexpected result was easily remarked that for reproduction it is necessary to have a current in the telephone circuit, and that, at least within certain limits, reproduction is louder the stronger the current is. To regulate this current a variable EMF. can be connected into the secondary circuit. Evidently this phenomenon is not compatible with the idea that the currents reproducing the sounds in the telephone are nothing but discharge currents from a polarized electrode. Such a discharge would naturally have to occur when no permanent current was flowing, and the superposed permanent current would have no influence on it. The assumption that the variation in resistance or contact resistances of the polarized platinum belt caused the effect would certainly agree with the above-described behavior. For these would naturally require a current to make the variations in resistance active, and the volume of sound would necessarily, as had been observed, increase with the value of the constant current. The following observations, however, make this explanation questionable.

*The above-described experiment had been already made by me in June of last year; without knowing of this, Herr von Lieben suggested to me soon afterwards the making of a phonograph based on the variations in resistance which could be produced by the electrolytic deposit of films of oxide or the like on metal electrodes. Thereupon we continued the investigation together.—W. NERNST.

It is difficult to assume that hydrogen or oxygen polarization on platinum would cause noticeable variations in resistance. Besides a very strong action is also noticed in employing a solution of silver-potassium cyanide and a moving strip of silver, in which any variation in resistance is certainly not to be expected. We would put forward the following explanation as most probable: Variations of the microphone currents cause a superficial disintegration of the metal electrode passing through the electrolyte. According to the amount of this disintegration, which would naturally be accompanied by a change in the polarization capacity, variations in the constant current would occur on reproduction, which would be reproduced as sounds in the telephone. Although, as already remarked, in some cases a really clear and sufficiently loud reproduction of spoken words occurs, we believe, nevertheless, that the above-described arrangement would not afford any practical utility on account of its frequently uncertain behavior, and also for other reasons.

ADDITIONAL NOTES BY HERB ROBERT VON LIEBEN.

As a continuation of the experiments contained in the above article, I have tested other metals than the above-mentioned platinum in

FIG. 2.

their applications to an electro-chemical phonograph. The frequent tearing of the platinum belt, in consequence of the continual bending, disturbed the observations, as did also the joint in the belt. So it was necessary to try another arrangement. The following showed itself suitable:

A copper disk, about 2 mm. thick and 450 mm. diameter, screwed between two strong cast-iron plates, rotates on a pivot bearing. Parallel to the cast-iron plates a second driving disk, also of cast iron, is keyed. This is driven by an india-rubber friction pulley at the end of the shaft of a small electromotor. By moving the electromotor on slide bars at right angles to the axis of the copper disk, the friction pulley can be made to drive the cast-iron disk either near its center or its periphery, so that different speeds can be given to the copper disk. The edge of the copper disk is carefully turned up, and current may be led to it directly through the pivot bearing. The other electrode is in a small glass trough, measuring about 20 x 5 x 10 mm., in which also is the wooden wedge (beech or cane) which is saturated with the electrolyte. It was found advantageous to connect the trough with a weak spring, so that the point of the wooden wedge is gently pressed against the periphery of the copper disk. The latter is about 3 mm. wide, and the width of the contact of the wedge about 1/4 mm. The smallest speed which could

be employed for clear reproduction was about 60 revolutions per minute, and the purity of the tone increases as the speed increases. There was easily room for one or two words on the periphery of the disk. In order to prevent disturbing noises it was necessary to insert a pad of blotting-paper or similar material, soaked in the electrolyte, which pressed gently against the periphery of the disk. This prevented the crystallization of the film of electrolyte, as it passed through the air, without moistening the periphery too much.

Fig. 2 shows diagrammatically the connections employed, these being almost exactly as in the previous experiment. A resistance W_1 is added, however, with a sliding contact c , which enables the EMF. of the trough to be compensated so that the null instrument G indicates no current. In making the record the current takes the following path: From the accumulator battery A_1 it flows to the switch C , a part going through the resistance W_1 and the voltmeter VM , and part through the periphery of the copper disk, and thence through the saturated wooden wedge to the electrode. From here, through the ammeter AM , the mercury contacts W , then through the secondary coil S , again through the contacts W to the null instrument G , the sliding contact c , the switch C and back to the battery. If the sound is to be reproduced, the connection to the mercury contacts is changed, so that the current flows through the telephone T . While recording, the battery A_2 sends current through the microphone M and the primary coil P . Induction currents are therefore produced in S which are superposed on the constant current of the battery A_1 and vary its value. The ratio of transformation P to S is not unimportant. As the result of trials the best was found to be 1 : 80. Many experiments were not made with regard to this, but there must be a certain best ratio. The resistance of the microphone and telephone was taken as small as possible. It was found to be a decided disadvantage to connect the microphone directly into the circuit of the battery A_1 , as, on account of the disturbing noises which take place with a high current density at the contact surface of the wooden wedge (due to interruptions through bubbles of gas, etc.), this would necessitate too small a value for the current in the microphone for it to work well.

SUPERHEATED STEAM.*

BY ERNEST H. FOSTER.

It often occurs that a mechanical improvement attracts more or less wide attention for a time and then falls into disuse, even to the point of being almost forgotten, because of some apparently insurmountable obstacle, to be taken up again at a later date when the conditions governing its use appear to be more favorable.

This seems to be especially true with the subject of superheated steam, by which we mean the practice of raising steam, immediately after its generation in the boiler, to a temperature considerably in excess of the saturation point, without greatly increasing its pressure, for the purpose of working it in a steam engine in this condition.

Considerable attention was given to this subject as far back as the year 1850, when we find numerous reports of engine tests which show

*Paper read at the Milwaukee meeting (May 28-31, 1901) of the American Society of Mechanical Engineers.

most remarkable gains, ranging from 30 per cent. to 40 per cent., of work done with a given amount of superheated steam over the same weight of steam at a temperature corresponding to its pressure. These early experiments seem to have been practically confined to marine practice, possibly because this was the most active field for developing the steam engine at that time, and some idea of the thoroughness of the investigation is obtained from the accounts of long voyages, covering several thousand miles, of which records were kept of the amount of coal burned when the engines were worked with superheated steam and of corresponding voyages using steam without superheating.

In this first volume of researches Chief Engineer Isherwood discusses this matter quite carefully and draws the general conclusion that, while great economy is doubtless to be obtained by using superheated steam in engines, the extra bulk and weight of the apparatus required to produce the superheat, the vulnerability of the same to destruction, but more especially the bad effects of superheated steam on the interior working parts of the cylinders and valves of the engines, chiefly due to the destruction of the lubricating oils before they have had a chance to perform their work, constituted real difficulties which rendered the use of superheated steam at that time undesirable. In spite of this carefully considered condemnation and Isherwood's apparent attempt to dismiss the subject as being the wrong line to pursue in steam engine development, the question of superheating seems to have continued to attract wide attention. The saving in the coal pile was too great to be ignored, and engine constructors and owners were tempted by the reduction in operating expenses to take the risk of inefficient lubrication and the other attendant difficulties, and so much progress was evidently made that we find in Isherwood's second volume of *Experimental Researches*, issued only two years later, even more attention devoted to superheating than before and with quite different conclusions. In fact, superheating is distinctly recommended, and the statement made that the average gain in work done of about 33 per cent. may be counted upon. He recommends the steam to be superheated not more than 135 degrees F., and suggests 100 degrees as an average which it is safe to assume because of the inability of the oil to stand a higher temperature without destruction.

The primitive form of the engine, the inefficient insulating covering, and the low pressure used at that time were conditions which undoubtedly lent themselves to making the use of superheated steam exceedingly advantageous, and the difficulties of lubrication, packing of stuffing boxes, etc., must have been found to be very great in order to cause this practice to be discontinued for so long a time, as it undoubtedly was. At the same time the compounding of steam cylinders, the introduction of condensers, the improvement in valve gear and general construction, the increase of steam pressures, and other radical improvements were so rapidly brought into general use that the amount of work done per unit of steam was raised to a higher point than ever before, in spite of the drawbacks of moist steam.

As the superheater was lost sight of, the improvements which were being adopted in other directions were of such a nature as to diminish its importance. Let us examine these im-

provements to the steam engine. Have they in any way interfered with it as a user of superheated steam? On the contrary, we find the steam engine of the present day much more suited to the use of superheated steam than formerly. We now have mineral oils which will stand high temperatures without disintegration; we have stuffing boxes packed with metallic packing; we have cylinders and steam pipes covered with a much more efficient insulating material; we have the wearing surfaces of cylinders and pistons machined to a nicety, and the interior surfaces often highly polished; we have improved forms of balanced and steam tight valves, and these with our present searching after every device to make the engine more economical, seem to open a field for the superheater to an almost unlimited degree.

In Europe we find much encouragement in this belief. We Americans have characteristically developed the line following the path of least resistance, practically ignoring the question which had seemed to be set aside. Europeans, however, particularly on the Continent, also true to their characteristics, seem to have been plodding along in the direction which they knew to be meritorious, gradually working out the problems, and slowly overcoming the obstacles, until we now find them in a state very much in advance of ourselves.

In this matter great credit is due to that able Alsatian engineer, G. A. Hirn, and to his successor, Emil Schwoerer, and also to the German engineer, W. Schmidt, for keeping this subject alive. We find them with records of several thousand successful installations of large and small plants, and European engineers educated up to a point where no economical steam plant is seriously contemplated without including the superheater. Most of the records of these tests show a saving in steam and fuel ranging from 6 per cent. to over 20 per cent.

What is the reason for this increased efficiency of steam when superheated? Rankine discusses the question in his work on the steam engine.

1. We raise the temperature at which the steam receives its heat and so increase its efficiency without producing a dangerous pressure. According to the law of efficiency of thermodynamic engines, the heat transformed into mechanical energy bears the ratio to the whole heat received by the fluid as the range of temperatures is to be the absolute temperature at which the heat is received, as follows:

$$\frac{T_1 - T_2}{T_1 + 461.2}$$

The more heat supplied per unit of volume of steam to the engine the more work can be obtained from the engine, and the increase of pressure having a practical limit, this extra heat is to be obtained by superheating the steam.

2. The diminished density of the steam employed to do the work lessens the back pressure, or, as commonly expressed, improves the vacuum. This also applies to the air and vapor which are carried with the steam and further expanded by the increased heat, and are consequently contracted to a much less volume when chilled by striking the cooling surface of the condenser; thus the air pump has less work to do.

3. The prevention of condensation during expansion without the use of steam jackets,

and in a much more effective manner. This is the most important advantage to be attached to the use of superheated steam. Steam jackets are wasteful and inefficient when applying heat to the engine. Inefficient because the contact is only with the steam immediately adjacent to the walls of the cylinder, with probably little effect being derived by the steam in contact with the piston and in the interior of the cylinder out of reach of the radiation from the walls; wasteful because of the full effect of heating the exhaust steam after it has done its work in the cylinder during the waning stages of expansion and throughout the exhausting stroke. This is particularly true of engines which have a pause at the end of the stroke, which pause always finds the cylinder full of steam which has completed its work in the cylinder and is ready to be exhausted. Ample evidence of the truth of this statement is found in the high ratio of water condensed in the jackets of direct-acting pumping engines to the amount of steam used in the cylinders.

The use of superheated steam is bound to have an important effect on the question of jacketing cylinders. If the superheating is sufficient to carry the steam through the engine to the point of final exhaust without reaching the saturation limit, there is evidently no use for steam jackets. This, however, necessitates the careful covering of the cylinder walls and steam passages to prevent as much radiation as possible, and the logical development of this question would seem to be to abandon the low-pressure jacket first, and follow by giving up the intermediate, and finally the high-pressure jackets, and substitute for these ample intermediate reheaters, between the cylinders, so proportioned that each cylinder would exhaust its steam at a point just sufficiently above the temperature due to the pressure to insure the absence of any condensation.

The use of perfectly dry steam and the elimination of condensed water would seem a very practical advantage of superheating. Water is a disturbing element in steam engines and pipes at all times. It increases the friction of the wearing surfaces, interferes with the lubrication, and chokes up the discharge; it produces unequal strains in the metal, due to different temperatures, and often gives leaks at joints which remain perfectly tight under dry steam. Dripping at stuffing boxes is also avoided in this way.

It has always been difficult to determine the actual amount of moisture which is contained in steam; some light is thrown on the subject by the use of superheated steam. For instance, at a working pressure of 125 lbs. 1 per cent. moisture would represent about 20 deg. of superheat. We find under the best conditions of properly proportioned steam pipes, and well covered, a loss of 1.5 of a deg. F., to 1.3 of a deg. F., of superheat per foot of steam pipe. It would not be out of reason to assume that with the ordinary large and indifferently covered steam pipe the loss would reach even as much as 1 deg. F., for every foot of pipe; consequently a pipe 100 ft. long might lose 100 deg. of superheat, corresponding to 5 per cent. of moisture in the steam, provided the steam was dry on leaving the boiler. Even assuming $\frac{1}{2}$ deg. loss per foot, we should have a condensation of $\frac{1}{4}$ per cent. in a steam pipe of this length.

As the friction for superheated steam is much less than for saturated steam in passing

there is not so much loss in ports and passages, and the size of the pipes may be considerably reduced. The tendency in this country has been to use steam pipes which are much too large. Good practice with superheated steam recommends that the velocity should not be less than 100 ft. per second passing from the boiler to the engine. Of course, this means ample steam receivers in proximity to the engine, and a good plan would be to have those receivers fitted with reheating tubes containing steam which is being circulated through the superheater, or else a portion of hot furnace gases, diverted from their course for this purpose, and returning again to the boiler flue by means of an induced draft.

Having once evaporated water into steam at an expense of 1,000 or 1,100 heat units why allow it to condense and drop over 800 of the heat units before doing its work, and rush forward more steam to take the place of that which is lost, instead of supplying the necessary heat for the re-evaporation, thus saving the heat originally expended.

As to the present effect of superheated steam on lubricating oils and stuffing box packings, it may be said that the present practice provides, and in fact already demands, oil and packing which will easily withstand these conditions. Mineral oils have supplanted the old vegetable oils and animal fats which were formerly used with machinery, and metallic steam packings have been universally adopted. Both of these were necessitated by the temperatures due to the steam pressures in the vicinity of 150 lbs. to the square inch, which is now common practice; hence, we already have the way thoroughly paved for the introduction of superheated steam.

We have mentioned European practice in this direction. There we find no prominent central station designed without providing for superheated steam; engine builders make guarantees contingent upon it, giving an advantage averaging about 12 per cent. in pounds of steam per horse power based upon the steam being superheated. The range of temperatures has resolved itself into recommending the use of steam at between 500 deg. F. and 600 deg. F. Good practice abroad may be said to lie in the vicinity of 570 deg. Experimenters have observed that steam expands more rapidly during the first 20 deg. of superheating than when further raised in temperature; consequently the first effects are proportionately more beneficial.

The method of constructing the superheater naturally presents the most important aspect of the situation after deciding that the results are beneficial and desirable.

Dismissing the subject of superheating by means of wire drawing as being inefficient and impracticable, the methods resolve themselves into a system of tubes or pipes, through which the steam is passed after leaving the boiler on its way to the engine; these pipes being subjected to the hot furnace gases, either in connection with the steam boiler itself or in a separate setting having a fire of its own. In large plants it is usual and even more desirable to set the superheater by itself, and it is placed alongside of the boiler as a continuation of the battery, with fronts and setting similar to the boilers, and fired in the regular manner as the boilers. The fact that the results are found to justify such an addition to the plant is the best testimony in favor of superheating.

Much rivalry exists between the use of cast-

iron and wrought-iron tubes for superheaters, and there seem to be well defined governing conditions in different instances where either one or the other is found the most desirable.

For general use, however, the author unquestionably leans towards the cast-iron construction, believing that it possesses greater durability, and because of the greater mass of heated metal which serves to maintain the temperature of the steam at a more even point, regardless of not being so much affected by the working of the fire.

The same objections which are raised to the use of cast-iron in boiler construction can not apply to superheaters. The presence of water in a boiler gives rise to unequal temperatures, which produce severe internal strains in the metal, whereas a superheater contains no water, and the comparatively even temperature of the steam relieves the metal of all strains except those due to the bursting pressure.

The cast iron superheaters which the author inspected had great strength and durability; some of them had been in use for six years without giving the slightest trouble or showing signs of deterioration.

The point of application of this type to the boiler varies with the construction of the latter. For instance, the most favorable location on a Babcock & Wilcox boiler is immediately over the tubes and under the shell; the same is also true of a Heine boiler; but at the same time a good arrangement may be made in either of these types by placing the superheater back of the bridge wall and underneath the tubes. In the independently fired boiler of the marine type the superheater may be placed in the main flue or at the back of the boiler where the gases are turned up to enter the tubes. In an ordinary return tubular boiler the flue at the back, immediately at the entrance to the tubes, is a very appropriate place for the superheater, as on account of the high temperature at that point the heating surface may be distributed with great efficiency.

The Babcock & Wilcox Company make a simple and ingeniously arranged superheater of this type consisting of two cast-iron headers set parallel and adjacent to each other, with openings facing in the same direction. The headers are joined by rows of 1½ in. wrought return bends, which extend out into the hot gases.

This arrangement is well adapted to the popular form of the Babcock & Wilcox boiler and efficiently utilizes the triangular space between the horizontal drum and the tubes.

As to the actual results which may be promised to any prospective user of superheated steam, we shall content ourselves with the statement that this depends entirely upon the surrounding conditions. That some benefit may be derived is without question. It is a remarkable fact that throughout all the mass of evidence which has been accumulated during many years one result seems to be universal, however vague or incomplete the recorded data—superheating always results in a considerable economy of steam used.

After all, a conclusion of this sort is about all which could be expected from a mass of reports, from widely different sources, of tests made according to no common standard. In such cases the data are bound to be incomplete, but not altogether without value on this account. If we find such important items as the temperature of the fire, rate of combustion, temperature of escaping gases, efficiency

of boiler, amount of draft, etc., omitted, these tests may be regarded of less value from a scientific point of view, or as an aid to the constructor, yet we are glad to have them for the assistance which they give us in forming an opinion of the general subject.

We feel convinced that much improvement in steam engine economy may be obtained by using superheated steam, even in the highest class of engines of the present day.

We believe the superheating of steam will give the triple expansion engine somewhat of a setback. We have records of tests under which a compound engine with superheated steam has given better results, under similar conditions of work, than a triple expansion.

The superheater virtually adds to the heating surface of the boiler. In a well proportioned plant, where the waste gases are rejected at a low temperature, the net gain by superheating will obviously be less than in a plant where available heat is allowed to find its way to the chimney. We are always sure of some improvement, but each case must be considered by itself in determining the amount.

PERSONAL MENTION.

Mr. David L. Gitt of Washington, D. C., has been selected by the American Wireless Telegraph Company of Philadelphia, Boston and New York to represent that company at Atlantic City this summer.

Mr. Nelson Perin, president of the United Railways & Electric Company of Baltimore, Md., will retire at the next meeting of the directors, and will be succeeded by George R. Webb, who is also president of the Maryland Telephone Company.

Exports of Electrical Material from New York.

The following are the exports of electrical material, from the port of New York, for the week ended June 19:

Aberdeen, 6 packages, \$500; Antwerp, 43 packages, \$2,726; Amsterdam, 4 cases, \$54; Australia, 14 packages, \$2,080; Barcelona, 2 packages, \$102; Belfast, 15 cases, \$990; Berlin, 1 package, \$275; Brazil, 21 packages, \$390; Bremen, 1 package, \$327; Bristol, 11 cases, \$500; British East Indies, 1 package, \$57; British Africa, 11 cases, \$3,384; British West Indies, 16 packages, \$371; Brussels, 1 package, \$100; Central America, 1 case, \$13; Copenhagen, 1 case, \$26; Cuba, 35 cases, \$375; Dundee, 3 packages, \$150; Ecuador, 2 packages, \$33; Glasgow, 45 packages, \$3,193; 22 reels cable, \$10,669; Hamburg, 72 packages, \$8,097; 12 auto vehicles, \$1,275; Havre, 49 cases, \$25,221; 14 packages, \$1,688; Liverpool, 80 packages, \$4,858; London, 222 cases, \$7,221; 9 motor vehicles, \$3,780; Manchester, 3 cases, \$1,365; 543 packages, \$60,323; Mexico, 83 cases, \$710; Moscow, 1 case, \$90; New Castle, 2 packages, \$100; Peru, 1 package, \$70; Preston, 20 packages, \$900; Southampton, 3 cases, \$490; 25 packages, \$894; U. S. Colombia, 4 cases, \$750; Venezuela, 3 packages, \$33; Wall-sall, 14 packages, \$559.

Change in Sixty-nine Years.

I have just looked upon two pictures, one entitled "DeWitt Clinton and Train—1831" and the other "Empire State Express—1900." The former shows the primitive locomotive DeWitt Clinton, belonging to the New York Central Railroad, drawing a train of three old Concord stage coaches at its top speed of 15 miles an hour over the 17 miles of track which constituted the "New York Central System" sixty-nine years ago. It is most comical. The latter exhibits the Empire State Express going 65 miles an hour with its splendid train of rolling palaces on a part of the same "system," now grown from 17 miles to 10,453. The road's equipment in 1831 was one engine and three made-over stages; to-day it is 3,580 locomotives, 185 sleeping and parlor cars, 3,600 passenger, baggage, mail and express cars and 150,400 freight cars. This equipment carried over 52,000,000 passengers in 1899 and more than 103,000,000 tons of freight. Something of a contrast—"On the Tip of the Tongue" in the New York "Press."

INCORPORATIONS.

The Greensboro Electric Company, Greensboro, N. C. Capital stock, \$250,000.

The Randall Electric Company, New York City. Capital stock, \$10,000. Directors: P. M. Randall, N. E. Randall and J. G. Gorham, all of New York City.

The Standard Insulation Company, New York City. Capital stock, \$100,000. Directors: Bernhard Sandel, Peter Fogarty and Arthur Heine, all of New York City.

The Spencer Electrical Company, New York City. Capital stock, \$100,000. Directors: J. H. Spencer of New York City, C. L. Child of Montclair, N. J., and Henry Dawson of Richmond Hill, L. I.

The Watkins Consolidated Electric & Gas Light Company, Watkins, N. Y. Capital stock, \$100,000. Directors: A. R. Horn of Catsauqua, Pa., J. J. McKee of Bethlehem, Pa., and Charles B. Reid of New York City.

The New York & Richmond Gas Company of New York City, Albany, N. Y.—to furnish gas and electricity in New York City, particularly in the Borough of Richmond. Capital stock, \$1,500,000. Directors: Armitage Matthews and Robert C. McCormick of New York City, Archibald A. McGlashan of East Bloomfield, N. J., G. W. Sutton of New Rochelle and Hawkins A. Tucker of Brooklyn.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED JUNE 18, 1901.

ELECTRIC RAILWAYS AND APPLIANCES.

676,745. Electrohydraulic Brake for Railway or Like Vehicles. Andre Goldschmidt, Paris, France, assignor to Compagnie Internationale du Frein Electro-Hydraulique Durey, Brussels, Belgium. Filed Feb. 12, 1901.

ELECTRIC LIGHTS AND APPLIANCES.

676,848. Incandescent Lamp. Christian Hoelscher, Warren, O., assignor of one-half to the Wiswell-Fritchard Electric Mfg. Company, Niles, O. Filed May 25, 1900.

ELECTRICAL MACHINERY AND APPARATUS.

676,426. Rheostat-Controller. John Dillon, Milwaukee, Wis. Filed March 22, 1901.

676,439. Pole-Piece for Dynamo-Electric Machines. Frank A. Merrick, Johnstown, Pa., assignor to the Lorain Steel Company of Pennsylvania. Filed March 20, 1901.

676,520. Electric Motor. Arthur P. Warner, Milwaukee, Wis., assignor of one-half to the Northern Electrical Manufacturing Company, Madison, Wis. Filed Oct. 22, 1900.

676,849. Circuit-Breaker Trip. Arthur J. Purinton, Waterbury, Conn. Filed May 9, 1900.

TELEPHONES AND TELEPHONE APPARATUS.

676,517. Supervisory Signal for Telephone-Switchboards. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Aug. 15, 1898.

MISCELLANEOUS.

676,436. Telegraphic Instrument. Harry T. Johnson, Jersey City, N. J. Filed July 5, 1900.

676,441. Fan Motor Support. Fred P. McBerty, Warren, O. Filed June 12, 1900.

676,524. Electrode for Secondary Batteries. Wilson H. Abbey and Jacob Altmos, Cleveland, O. Filed Aug. 25, 1900.

676,575. Electric Furnace. Alfred H. Cowles, Cleveland, O., assignor to the Electric Smelting & Aluminum Company, same place. Original application filed July 6, 1895. Divided and this application filed April 9, 1897.

676,576. Electrode Connection for Electric Furnaces. Alfred H. Cowles, Cleveland, O., assignor to the Electric Smelting & Aluminum Company, same place. Original application filed Nov. 24, 1899. Divided and this application filed Aug. 30, 1900.

676,577. Electric Smelting Process of Reducing Sodium Compounds. Alfred H. Cowles, Cleveland, O., assignor to the Electric Smelting & Aluminum Company, same place. Original application filed July 20, 1895. Divided and this application filed Sept. 27, 1900.

676,583. Electrical Apparatus. Thomas B. Kinraide, Boston, Mass. Filed Aug. 13, 1900.

676,618. Magnetic Separator. Thomas A. Edison, Llewellyn Park, N. J. Filed July 16, 1897.

676,738. Electrically Propelled Boat. William R. Edwards, Weybridge, Eng. Filed March 2, 1901.

676,744. Burglar Alarm. Orval J. Gatten, Columbus, O. Filed Feb. 4, 1901.

676,840 676,841. Magnetic Separating Apparatus. Thomas A. Edison, Llewellyn Park, N. J. Filed Jan. 9, 1900, July 2, 1900.

676,853. Electrically-Illuminated Cross. Henry J. Schlacks, Chicago, Ill. Filed April 22, 1899. Renewed May 15, 1901.

676,874. Automatic Telegraph. Harry Shoemaker, Philadelphia, Pa., assignor to Gustave P. Gehring and Marie V. Gehring, same place. Filed Feb. 12, 1901.

THE TELEPHONE WORLD.

Independent Companies to Build a Trunk Cable

Indiana capitalists have bought a considerable portion of the stock in a company proposing to build a trunk telephone cable to result in a consolidation of the independent plants in Iowa, Kansas, Missouri, Texas, Indiana, Ohio, Illinois and Pennsylvania. The plan is to have the cable start in Texas, and run through the southwestern States to St. Louis, and then east to Pittsburgh. The individual companies will pay tolls to the trunk company. The new scheme is to be capitalized at \$500,000, but it is understood that does not represent the total cost. Nearly all the stock has been sold.

University Place, Neb., is threatened with more extended telephone service. It is understood there that the Plattsmouth Independent Telephone Company will ask permission to extend its lines into University Place at the next meeting of the city council. This company secured a franchise at Havelock, where it expects to open a local exchange as soon as its lines can be extended from Greenwood, Neb., the present nearest point on the independent line. A representative of the Nebraska Telephone Company has also been canvassing the merchants. As far as possible the old company will endeavor to forestall the competition of its newer rival, an endeavor to install many new party lines to pay as the 'phones are used being part of the present programme.

The common council of Litchfield, Mich., has granted a 30-year franchise to L. B. Agard and others, giving them the privilege of erecting poles, stringing wires and conducting a general telephone business in that village. A stock company will be immediately organized. The stock has already been more than subscribed for. The company proposes to erect lines in the country connecting with the farm houses, and also to connect with Homer and Concord, which have local service. Enough telephone contracts have been signed to make the venture a success.

At a recent meeting of the Norwood, Pa., council ordinances granting permission to the Keystone State and the United Telegraph & Telephone Companies to erect and maintain their lines in the borough were adopted on second reading. Bills amounting to \$398 were ordered paid. The treasurer reported a balance of \$14 in the treasury.

The New England Telephone & Telegraph Company is constructing a line connecting Meredith, N. H., with Pine Island in Lake Winnepisegee. The line will be seven miles in length, and the overhead wire will cross three other islands in order to reach the terminal. The greatest length of span across water is 500 feet.

The Michigan Telephone Company reports a net gain of 2,407 subscribers in May, making a total number of 49,609 subscribers on May 31. The Erie telephone system, of which this company is a part, reports a net gain of 3,564 subscribers in May and a net gain of 8,545 since January 1, making a total number of 150,144 subscribers on May 31.

The farmers of Crawford County, Ind., have been putting up private telephone lines, and nearly every farm house is provided with a 'phone. They secured right-of-way over the public roads into the town of English. The cost is very small, being \$10 for a share of stock and \$14 for a box, while the service is free to all points.

The Rocky Mountain Bell Telephone Company has a large force of men at work on a line between Big Timber and Helena, Mont., on a cross State long-distance line. From Lameli the company will erect a branch line to Red Lodge, and later extend the same to Cody, Wyo.

The Pensauken, N. J., township committee has granted a franchise to the City & Suburban Construction Company to erect poles and string wires, lines and cables for the purpose of operating a telegraph and telephone exchange in the said township.

The borough council of Collingdale, Pa., has granted the Atlantic Telegraph & Telephone Company permission to place poles and string wires throughout that borough.

The New York & New Jersey Telephone Company has established a new central office in Port Washington, N. Y., and in the near future it will be open night and day.

The Dirigo Telephone Company has extended its line to the West Peru and Dixfield, Me., railroad station, also to West Peru village.

The Cumberland Telephone Company has a force of hands at work putting in an exchange at Hodgenville, Ky.

Another Independent Company for Michigan.

The Stoddard Telephone Construction Company is organizing an independent telephone company in Monroe, with a view to giving connections with the United States Telephone Company's long-distance circuit, besides local service. The organization of the new company is about perfected, and the work of soliciting subscribers for the local exchange will follow immediately. The Stoddard Company manufactures telephones and switchboards, many of which are now in use in that State, and is in a position to equip an independent exchange at once.

Growth of Independent Companies in Kentucky.

The Kentucky Telephone Association will hold its meeting in Lexington, this week. The independent movement has made vast strides in that State, during the past six months. Lexington has recently put in an exchange and toll lines to adjoining counties. Louisville is at work on a million capital, and will, in addition to a large exchange, have connections not only throughout the State, but to neighboring States. There are more than fifty local companies interested in the Association, and they propose to network the State and place telephones within the reach of the masses and at reasonable rates.

Bishop Preston is negotiating with the Bell Telephone Company looking to the putting in of a telephone line between Salt Lake City and Wasatch, Utah. If built, the communication will be made via Sandy. A telephone will also probably be put in at Brighton this year. In addition to the request of the summer resort people, several mine owners in close proximity have expressed a desire for better communication with Salt Lake City than is now possible and it is believed that a combination will be formed of sufficient magnitude to induce the telephone company to construct the line.

The Colorado Telephone Company directors, at a special meeting in the Telephone Building, at Denver, voted to renew the corporate life of the company for twenty years. The laws of the State only allow an incorporation to take out a charter for twenty years, at the expiration of which time it must be renewed. That period has elapsed since the Colorado Telephone Company was formed, and the old articles will be filed again with the Secretary of State without change.

A special meeting was recently held by business men of Gibbon, Neb., to get an expression as to the advisability of putting in a telephone exchange in that place and tributary territory. The vote was unanimously in favor of a system, and steps will be taken at once to have one installed.

The Richmond & Damon Mound, Tex., Telephone Company was organized a short time ago to be chartered for \$10,000. The line has been completed and is doing a fine business. J. H. P. Davis is president; T. B. Wessendorf, vice-president; E. D. Bell, secretary and treasurer.

News from Minneapolis, Minn., states that the series of wind and electrical storms during last week has caused the Northwestern Telephone Company much trouble with its service, and necessitated the expenditure of several thousand dollars for repairs.

The telephones for the Flanagan, Ill., telephone system will be put into operation at once. Flanagan will thus be connected in a short time with all the surrounding towns, and as there are four country lines running in there it will thus be a center for telephonic communications.

At a recent meeting of the Napoleon, O., council, a franchise was granted to the Citizens' Mutual Telephone Company, with an exchange at Napoleon. Several local exchanges are located in the south and eastern parts of Henry County.

About 3,000 copper contracts have already been secured by the canvassers of the People's Telephone Company of Detroit, Mich.

A report from Cleveland, Tenn., says, unwilling to pay increased rates of the Cumberland Telephone Company, business men will establish a new company.

The new telephone company of Louisville, Ky., is preparing to invade Jeffersonville in that State. It will be given hearty encouragement.

The Holston Telephone Company has extended its line across the Holston River into the New Hope, Tenn., neighborhood.

Long Distance Telephone Extension.

The United States Telephone Company will extend its line from Logan to Nelsonville, O. Work has already begun on the extension at the other end of the line. The required material was sent down the valley, and the force of workmen is now at work. The United States Company is the long distance line of the Standard, and has entered the field as a competitor of the Bell. It has proven a strong competitor to the old company and is adding new toll stations to its service in Ohio almost every day. The long-distance service of the local company is by this company.

Chinese Telephone System.

What is said to be the only Chinese telephone system in the world is in operation in the city of San Francisco, Cal. There are altogether about 18,000 Chinese citizens, of whom 1,500 are merchants. Of this number 270 are subscribers to the telephone.

These Chinese merchants were prompt to understand the saving of time and great convenience in the use of the instrument. Though looked upon, for a time, with some superstitious dread, familiarity has accustomed the people to its use and it has now become an indispensable concomitant of the regular office equipment. The central office heretofore has been too small to allow any increase of the subscribers, but the company has recently acquired a property and is fitting it up so as to accommodate any number. It is expected that with greater facilities twice as many instruments as are now in use will be installed.

The system in Chinatown is entirely independent and is for the Chinese only. To communicate with outside subscribers a separate charge is made. A white merchant using the Chinatown system must also pay extra. The Chinese subscribers can and do use the long distance wires upon payment of the customary charges.

The Dauphin County Telephone Company of Harrisburg, Pa., will vote upon the question of increasing the indebtedness to \$300,000 at a meeting early in July.

The independent telephone exchange at Sellersburg, Ind., which is connected with the Home Telephone Company's system in New Albany, is now opened with 135 subscribers.

The Peninsular Telephone Company of Tampa, Fla., has been granted a franchise for Bartow in that State.

Telephone Companies Increase Stock.

The Tazewell County Telephone Company of Vermont, Ill., from \$1,500 to \$10,000. The Monmouth Telephone Company, Monmouth, Ill., from \$35,000 to \$50,000. The Northern Iowa Telephone Company of Des Moines, Ia., from \$20,000 to \$40,000.

TELEPHONE INCORPORATIONS.

The Albion Telephone Company, Albion, Neb. Capital stock, \$20,000.

The Emporia Telephone Company, Emporia, Kan. Capital stock, \$60,000.

The Hamilton County Farmers' Telephone Exchange Association, Aurora, Neb.

The Waveland Telephone Company, Waveland, Ind. Capital stock, \$1,000.

The Shannondale Co-operative Telephone Company, Shannondale, Ind. Capital stock, \$600.

The Citizens' Telephone Company, Pekin, Ill. Capital stock, \$50,000. Incorporators: James M. James, James W. Barrett and E. R. Priton.

The Wenona Telephone Exchange, Wenona, Ill. Capital stock, \$2,500. Incorporators: M. E. Gants, Edwin Gants and H. Ray Judd.

The Marengo Telephone Exchange, Marengo, Ia. Capital stock, \$7,500. J. H. Branch is president, Henry Gode; vice president; H. N. Havner, secretary, and John Kell, Jr., treasurer.

The Orion Telephone Company, Orion, Mich. Capital stock, \$5,000. Officers: President, Ira Carpenter; treasurer, I. C. Predmore; secretary, Attorney, Fred Wieland; manager, H. E. Goette.

The Beaumont Telephone Company, Beaumont, Tex. Capital stock, \$60,000. Incorporators: Melville D. Shaw, Chas. N. Haskell, James King Duffy, James E. Boynton, Charles H. Roser, Sheppard H. Van Wanner and William H. Aldridge.

GENERAL ELECTRICAL NEWS.

Lighting.

Augusta, Ga.—The city council is figuring on an electric lighting plant for the city hospital. The commissioner of public works, N. Wingfield, will advertise for bids for the plant.

Bloomington, Ill.—J. Van Dolah and C. P. Herog are preparing to improve the electric light plant at this place.

Cincinnati, O.—Sealed proposals will be received at the city clerk's office until 12 o'clock m. of July 12 for lighting by electricity the streets, lands, lanes, squares and public places of the city for a period of ten years from June 1, 1902. Said proposals shall be based upon specifications, copies of which will be furnished by the city clerk to any person or persons desiring to bid thereon. All proposals must be addressed to the Committee on Light of the Board of Legislation, care of the city clerk and be upon the form attached to the specifications, and should be marked "Proposals for Electric Lighting" on the outside.

Cullom, Ill.—E. E. Saylor of Gilman has been given a contract and 20-year franchise to light the streets of this place.

Elba, Ala.—P. R. Hightower of Quitman, Ga., has made a contract to place an electric plant in this place.

Geneva, O.—Local capitalists contemplate the erection of a new electric light plant.

Hamlet, N. C.—T. A. Sanders of Boston and M. C. Freeman will install an electric light plant at this place.

Highland, Ill.—At a recent meeting of the city council it was decided to improve the electric light plant at a cost of \$880; also recommended the electric light committee to take the necessary steps toward securing a new 125 horse power engine.

Lake Placid, N. Y.—Clarence Brokaw will install a 500 horse-power electric light plant here.

Memphis, Tenn.—A party of Chicago capitalists have asked the city council to grant them a franchise for 30 years for a commercial lighting plant. They are organized as the Little Rock Light, Heat & Power Company.

Muskegon, Mich.—The common council has passed a resolution allowing the Muskegon Traction & Lighting Company to erect a new combined power house and electric lighting station at a cost of \$100,000.

Ponca, Okla.—A contract has been closed here for an electric light plant with Samuel J. Mathews & Co. of Kansas City. It is to be completed by August 15.

Red Wing, Minn.—Bids will be received until July 5 for lighting the streets of this place for a term of one, three and five years respectively. C. E. Harrison, city clerk.

Roseville, Ill.—The question of erecting an electric light plant is being agitated at this place.

Rutland, Ill.—S. Bacorn, owner of the electric light system here, sold the plant to J. S. Webber. The new owner will make many improvements.

Saratoga, Wyo.—E. Storer Tice of Denver and J. M. Thomas, Jr., of Battle Lake, Wyo., have been granted a franchise for an electric light plant for this place.

Sturgeon Bay, Wis.—The citizens will soon vote on a proposition to erect an electric light plant.

Sardis, Miss.—The Sardis Electric Light & Power Company has been organized for the purpose of erecting an electric light plant at this place. About \$9,000 is to be expended.

Tell City, Ind.—The Tell City Water & Light Company has been organized with \$40,000 capital stock. An electric light plant is to be erected.

Tipton, Ind.—The city council has entered into a contract with the Wayne Construction Company of Ft. Wayne to build for the city a modern electric light plant at a cost of \$35,000.

Way Cross, Ga.—The Way Cross Ice Company has under consideration the erection of a new electric light plant.

Waynesboro, Ga.—The city is investigating the erection of an electric light plant. Address W. M. Fulcher and P. B. Hall.

Winchester, Tenn.—Kirkpatrick & Johnson of Jackson, Miss., have prepared the plans for the erection of a new electric light plant in this city.

Street Railways.

Baltimore, Md.—The Baltimore, Westminster & Gettysburg Railway Company, a franchise for which has been granted under the new General Rapid Transit law in Pennsylvania, will construct lines which will make a continuous trolley road from this city to points in Southern Pennsylvania. The United Railways of Baltimore are interested. The City Suburban system will connect with the Gettysburg at Reisterstown. Baltimore County. The corporators of the new company are L. A. Sweigard, T. E. Durham and W. H. Bartlett of Philadelphia, and Charles E. Fink of Maryland.

Bethel, O.—The Cincinnati & Suburban Traction Company has been incorporated for \$750,000 by J. R. Scrugham, R. T. Belt, N. Wolf and others. An electric railway will be built from Linwood to this place.

Birmingham, Ala.—J. W. O'Neill of this city is reported as interested in the proposed electric railroad between here and Wylam with several branches.

Chattanooga, Tenn.—The Chattanooga Rapid Transit Company has secured a franchise to build its electric line on several thoroughfares of this city. S. W. Divine is president of the company.

Corning, N. Y.—The proposed electric line between Elmira and here seems an assured fact from the statement of H. B. Rhymer of Elmira, one of the promoters.

Cortland, N. Y.—The Cortland County Traction Company was lately incorporated for \$320,000 to operate the franchises of the Cortland & Homer Traction Company.

Danbury, Conn.—Surveys for the electric railroad between here and Golden Bridge, N. Y., have been completed, contracts have been awarded, and construction will shortly begin. The road will be about 17 miles long.

Denver, Col.—The Denver & Northwestern Railway Company has been incorporated by S. M. Perry, C. J. Hughes, F. Perry and A. Smith. The new company proposes to build an electric line from this city to the mouth of Platte canon, Boulder, Greeley, Louisville, Littleton and Golden.

East St. Louis, Ill.—An electric railway from Alton to Venice, connecting at the latter place with the East St. Louis line will soon be built by capitalists of this place and Alton.

Knoxville, Tenn.—The Knoxville Traction Company contemplates making an extension to its present trolley system.

San Bernardino, Cal.—The San Bernardino Traction Company has been formed with \$500,000 capital stock for the purpose of building and operating an electric street railway. H. Fisher, H. Sinclair, E. S. Graham, A. C. Debnan and J. H. Fisher are the incorporators. The road will be extended to Riverside, Highland and Los Angeles.

Sparta, Mich.—Attorney M. M. Atherton who is associated with J. L. Hisey in the promotion of the Grand Rapids & Newaygo Electric Road announces that work will begin on the line about July 1.

Company Matters.

Chattanooga, Tenn.—J. H. Jefferis and Clarence P. King, of Philadelphia, president and director respectively of the Chattanooga Rapid Transit Company, are here conferring about the proposed extension of the Rapid Transit lines from the city to the base of Lookout Mountain, to connect with the Mountain Incline, now owned by the Rapid Transit Company.

Keyport, N. J.—The electric light company has been reorganized as the East Jersey Light & Power Company with a capital stock of \$250,000.

New York City.—It was announced in Wall Street circles June 19 that arrangements for the consolidation of the Otis Elevator Company and the Sprague Elevator Company have been practically completed.

Oakland, Cal.—Articles of incorporation of the Suburban Electric Light Company have been filed with the county clerk. The directors are stated to be J. H. Lawrence, William Angus, Wellington Gregg, Sr., and James L. Robinson of Oakland and E. P. O'Brien of San Francisco. The amount of the capital stock is fixed at \$500,000.

Riverside, Cal.—A company has been organized here by E. A. Chase and M. A. Chase, which will deal in electricity, etc., with \$400,000 capital stock.

Manufacturing.

Chicago.—The Duncan Electric Manufacturing Company has lately been incorporated with a capital of \$100,000. It purposes manufacturing electrical supplies. C. A. Brown, G. I. Cragg and H. L. Harrison are interested in the concern.

Newark, N. J.—Articles incorporating the Porto Rico Electric Company were put on record a short time ago. The concern is a foreign one with its chief local office at 169 North 9th street, where Edward W. Rockefeller is the legal representative. The company is authorized to manufacture and deal in electrical motors, dynamos and other electrical machinery in the island of Porto Rico and elsewhere, except New Jersey, and "to manufacture, buy and sell electrical current for light, heat and power," besides carry on the business of railway contractors and ship-owners. Its authorized capital stock is \$100,000.

New York City.—The Commercial Development Company has been formed to manufacture and sell electrical goods on a capital stock of \$500,000.

Pittsfield, Mass.—The Stanley Electric Company has begun work on one of the largest pieces of electrical machinery it has ever constructed. It is a generator 23 feet in diameter, and will cost with its full equipment about \$50,000. It will be of 1,725 kilowatts capacity, and will furnish power for 40,000 lights.

Power and Transmission.

Detroit, Mich.—James D. Hawks is promoting a salt and electrical power plant for the Rouge district, where the River Rouge Improvement Company, of which he is secretary and the principal stockholder, owns a large tract of land. The company will have a capital of \$6,000,000.

Gainesville, Ga.—The Gainesville Light & Power Company is a new corporation now applying for a charter, and has asked the city council for franchises. The company is to be capitalized at \$100,000, and proposes the development of the water power at the Chattahoochee River, owned by Col. S. C. Dunlap. Among the incorporators are F. L. Murray, of Chicago; J. J. Spalding, of Atlanta; J. J. Dunlap, Z. T. Castleberry, H. H. Dear, M. M. Ham, E. E. Kimbrough and Howard Thompson, of Gainesville.

Hagerstown, Md.—A scheme has been unfolded here by which a party of Pennsylvania capitalists propose to harness the Potomac River to supply power for Sharpsburg, Shepherdstown and other towns in this section. It is proposed to erect a dam in the river and convey power to the towns.

Susquehanna, Pa.—It is said that the Erie Railroad Company will construct an electric power plant here in the near future at a cost of about \$40,000. The plant will be placed on the banks of the river, and will be run by water power. It will furnish electric power and light for the shops, yards and station.

Automobiles.

San Jose, Cal.—The Christman Motor Carriage Company, of which W. Payton Smith is president and chief backer, J. F. Stephenson is vice-president and Charles E. Christman, mechanic and general manager, has decided to remove from Los Gatos to this city, as it is necessary to establish a larger factory. The change will be made about July 1. After the removal to this city the business will begin on a far more extensive scale, and the factory will enter into competition on the coast.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by ELECTRICITY from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16½@17c.; Lake, 17@17½c.; casting, 16½@16¾c.

Business failures in the United States last week numbered 193, against 179 the same week last year; In Canada there were 14, against 25 last year.

Directors of the Amalgamated Copper Company on June 20, declared the regular quarterly dividend of 1½ per cent. on the stock, and ¼ per cent. extra.

A petition is being widely circulated on the floor of the New York Stock Exchange asking for extra holidays on July 5 and 6, as the 4th comes on Thursday.

The Metropolitan Street Railway Company has declared the regular quarterly dividend of 1½ per cent., payable July 15. Books close June 26 and reopen July 16.

The Electric Storage Battery Company has declared regular dividends of 1½ per cent., for the quarter ending June 30 on both common and preferred stocks, payable July 1 to stock of record June 26.

A Baltimore, Md., dispatch states that it is thought that negotiations are pending between the Consolidated Gas Company and the United Electric & Power Company, looking to a consolidation of joint ownership.

The Kensington Electric Light Company bill, which offered to supply the lighting of Philadelphia, in opposition to the Philadelphia Electric Company, has been killed by the Electrical Committee of Councils.

It is stated that the Everett-Moore syndicate is negotiating for the purchase of another large system of interurban trolley line, which, when added to their thousand miles of traction, will give them a line from Port Huron, Mich., to Pittsburg, Pa. Three States will be crossed.

The following are quotations for some of the industrial stocks not quoted elsewhere: Electrical Lead Reduction, 3¼@4; Electric Boat, 21@23; Electric Vehicle, 8@12; Tel. & Tel. Company of America (full paid), 5@6; Electric Company of America, 8¾@8½; National Carbon, 15¼@16.

Judge Brown of the United States Circuit Court in Boston handed down at 12 o'clock on Monday his written decision in the Berliner patent case, which decision was orally announced on February 27, and was decided against the American Bell Telephone Company. The written decision is quite elaborate, 113 pages embracing the full text of Judge Brown's findings.

Receivers were appointed Saturday for the Nashville (Tenn.) Street Railway, capitalized at \$13,000,000. The Baltimore Trust and Guarantee Company, holder of \$2,000,000 of the company's bonds, alleged that interest payment was defaulted. Federal Judge Clarke appointed E. F. C. Lewis and Percy Warner receivers, pending a sale by foreclosure.

The Boston Electric Light Company has declared a regular quarterly dividend of 2 per cent. and 1 per cent. extra, payable August 1. Transfer books close June 29, open July 10. This is the last dividend to be declared by the company as a distinct organization, as the company will be merged with the Edison Electric Illuminating Company before its next dividend period.

A large stockholder in the Chicago City Railway stated recently that the syndicate seeking to purchase the street railway lines of that city had thus far made no proposition to the controlling interests of that company. He conceded, however, that it had been intimated to him that a formal offer for the property would be among the advents of the coming autumn and that it would be on lines worthy of consideration.

There are good reasons to believe that Canadians have secured control of Twin City Rapid Transit lines and the new company will probably be friendly. A new company will build an electric line connecting Minneapolis with Anoka, about 25 miles. It is believed this line will be extended to St. Paul. On Twin City Rapid Transit traffic is often greater than accommodations, and the advent of a new line will be welcomed.

At a meeting in Boston of the directors of the New England Telephone and Telegraph Company on June 20, it was voted to issue \$2,577,000 new stock. Payments are to be made one-half August 16 and one-half November 16. This issue will give rights to one share of new stock at par for every six shares now held. Part of the new issue will pay for the construction already done during the first half of this year, and will provide for the needs of the company for the remainder of 1901, and a portion of next year.

At a meeting of the American Telephone and Telegraph Company in Boston on June 19, the resignation of the president pro tem., Alexander Cochrane, was accepted to take effect June 30 and Frederick P. Fish was elected president of both companies to take effect July 1. This is in line with the official announcement made some weeks ago. Application has been made to list the American Telephone and Telegraph \$15,000,000 4 per cent collateral trust bonds of 1929; and \$114,946,000 capital stock on New York Stock Exchange. The company has declared the regular quarterly dividend of 1½ per cent., and an extra dividend of ¾ per cent., payable July 15. Books close June 29 and reopen July 16.

President C. W. Wetmore, of the North American Company, in his report to stockholders, among other things says: "Important changes and readjustments have taken place in certain of the company's investments since the last annual report. On February 1 the company sold practically all of its holdings of the preferred capital stock of the Milwaukee Electric Railway and Light Company and now owns practically all of the common stock of that company. During the year the company has also purchased valuable electric and gas light properties in Covington, Newport, Dayton and Bellevue, Kentucky, and has limited the ownership of these companies into a new corporation called the Union Light, Heat and Power Company, a large majority of the capital stock of which the North American Company owns."

ADVERTISING RATES.

As *ELECTRICITY* reaches all classes interested in electrical
work, its value as an advertising medium can be readily un-
derstood. Rates will be sent on application.

Changes of advertisements should reach the office not later
than the Saturday preceding the day of publication.

Entered at the New York Post Office as second-class mail matter

EDITORIAL NOTES.

The Northwestern Electrical Association Convention.

The Northwestern Electrical Association Convention, which was held during last week at Sheboygan, Wis., was a most pleasant affair from both a technical and social standpoint. A number of interesting papers were read and discussed, but in order not to make Jack a dull boy by too much work recreations were provided, such as a baseball game between the Benedicts and Bachelors, a trap shooting contest and a dance, to say nothing of other entertainment features.

These summer meetings are certainly enjoyable affairs and afford many hard-worked electrical men an opportunity of discussing subjects of interest, at the same time enjoying a pleasant outing.

The proceedings of the Convention will be found on another page of this issue.

Braking Apparatus for Electric Cars

In view of the interest that has been and is being taken in this country in the subject of the braking of trolley cars a paper read a couple of weeks ago before the Municipal Electrical Association of England, at Glasgow, should prove extremely interesting. The author of the paper, Mr. A. L. C. Fell, classes the various methods of braking electric cars under six heads: (1) hand brakes; (2) friction brakes; (3) slipper brakes; (4) pneumatic brakes; (5) electro-magnetic brakes; (6) Newell electro-magnetic brake.

In regard to hand brakes he said that in his opinion there is not any particular advantage to be gained by using one particular type as compared with another. The chief point in connection with all brakes is that reliable men should be employed to fit them on to the wheels of the cars so as to insure even pressure on the wheels. One very important matter concerning the adjustment of brake rods is not to employ locking nuts, as they cause serious delay when this work is necessary. The adjusting nut should be kept in position by a pivoted claw which can be simply thrown back when it is necessary to move the nut. He has tested various types of brake shoes and finds the "Corning" brake shoe is the best.

Friction brakes it seems cannot be used on the majority of English electric roads because

of the amount of room required to properly mount them on the axle. Slipper brakes form the most useful type of brake at present operating in England. They simply consist of wood blocks which are pressed down on to the rails by means of levers which are operated by means of a hand wheel connected by a chain or worm gear at either end of the car. The operating hand wheel is fixed on to a tube spindle which is placed outside the solid hand brake spindle.

The two spindles are quite independent of one another and separate ratchets and pawls are provided for locking them independently. It has been found in practice that it is advisable to design the slipper brake operating hand wheel so that it is impossible to lift the car off the rails. The framework carrying the slipper brake shafting, levers and slides is fixed to the sides of the truck frames. On all gradients steeper than 1 in 20 it is advisable to use the slipper brake, and the best results have been obtained when the slipper brake is worked as an auxiliary to the hand or electric brake. On single lines with steep gradients the slipper brake is especially useful as it not only retards the descending car, but also cleans the rails for the ascending cars.

Pneumatic brakes, Mr. Fell remarked, are unsatisfactory on account of their not always being reliable. On the subject of electro-magnetic brakes he made observations as follows:

"One type of this brake consists of two cast-iron disks, one of which is fixed to the motor and has a coil of wire wrapped round it, the other is keyed to the axle. The motors are used as generators and gradually short circuited through a rheostat and the disk coil above mentioned. The disks are thus magnetized and braking action is produced from three causes: (1) Retardation due to converting motors into generators by driving them from the car axles on practically short circuit. (2) Drag due to eddy currents which are set up in brake disk as it revolves in the intense magnetic field of the brake shoe. (3) The mechanical friction between the brake disk and shoe.

"As the braking effect is so rapid, great care has to be exercised not to magnetize the disks too quickly, otherwise the wheels will at once be skidded unless a very plentiful supply of sand is used. On a good rail this type of brake can be used for taking a car down a gradient of 1 in 11, but it is always safer to use a slipper brake in conjunction with the electric brake. In practice it has been found advan-

tageous to bring the slipper brake into operation at the top of a gradient and fix it, the speed can then be regulated by the band or electric brake. In the writer's opinion the hand brake should never be used in conjunction with the electric brake. but, if the former is in use, it should be released before the electric brake is applied."

After briefly mentioning satisfactory experiments with the Newell brake, witnessed by him, Mr. Fell said that tests had been made to ascertain the best methods of stopping cars under various conditions. Cars were run over a marked-off space on a practically level road. The speed was in each case carefully noted, and the brakes were applied at the one point in each case. From tabulated results obtained by the author and from his previous experience, it appeared that for all-round general purposes, the hand brake worked in conjunction with the slipper brake is the best and most reliable method of regulating the speed of a car. This is especially the case if the rails are greasy, because the wood block thoroughly cleans the rail. For emergencies, the electro-magnetic disk brake is the most satisfactory, but it requires to be applied very carefully as it is very liable to cause skidding. Mr. Fell says that the constant use of electric brakes is not to be recommended for the following reasons: (1) They are expensive items, and the wear and tear is very excessive. (2) When the gradients are very steep the life of the motors will be appreciably shortened as they will never get an opportunity to cool down.

Judging from the above it might be well for some of the trolley companies in the United States to give the slipper brake a trial. It could probably be placed on a car as an auxiliary without in any way interfering with a hand brake or friction brake.

Electricity for Men-of-War.

Electrical apparatus is being adopted more and more by the various navies of the world. The battleships Alabama, Illinois and Wisconsin, recently built for the United States, are provided with the most up-to-date marine generating sets and electrical paraphernalia. In view of this constantly growing demand for electrical labor-saving devices on men-of-war, an article which recently appeared in the "Electrotechnische Zeitschrift" of Berlin, is extremely interesting. It appears from the article in question, that in the German service separate lead and return wires have been generally adopted, concentric cables being used in the neighborhood of the ships' compasses. Attempts to employ a ship's structure as a return have not proven successful, and so far as large vessels are concerned, this practice has been entirely superseded, but in the case of new torpedo boats, where economy in weight is a vital consideration, the practice, according to the writer of the article, still holds. In all places exposed to the danger of mechanical injury, such as the engine rooms and stock holds, lead-covered, iron-armored cables are employed, while elsewhere cables well insulated with rubber, but otherwise unprotected, except in some cases by thin rust-proof wire, are used. The wood casing formerly employed has been abolished, owing to its inflammability. Hitherto, the telegraph and telephone cables have been of the lead-covered, iron-armored type, but the

newest ships have been provided with a central subway, like a corridor, as well as side corridors below the armored deck, which may be used for the electric cables, telegraph and telephone wires, etc., thereby avoiding all danger of mechanical injury to the same. It is proposed to dispense with the steel armor in the future, even for the lighting and power cables, retaining only the lead protection.

The practice of soldering branch connections has also been discarded in favor of branch fuse-boxes, in which the connections are made with terminal bars. These branch circuit boxes are made for two, three, four, six and eight lamps. They are, of course, water-tight. Their introduction seems to have been a complete success, facilitating as they do systematic supervision of the ship's wiring.

Although slate is at present generally used for switchboard bases in the service, it is interesting to learn that iron is proposed as a substitute, owing to the unavoidable breakages which occur. Small machine boards with iron bases have already been successfully introduced, but the difficulty of insulating the terminals and connections has hitherto prevented the adoption of the plan on a large scale. With the exception of the connections with the measuring instruments, all the switchboard connections on the Furst Bismarck were for the first time made with bare copper bars, whereby a neat, solid construction is obtained, which is also accessible. The necessary protection against moisture is provided by enamel, which also serves to distinguish the poles, red and blue being used. This type of board is particularly advantageous where the available space is limited in depth, so it is claimed, since the connections behind require no supervision and the screw terminals may all be withdrawn from the front of the board.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

DR. HENRY PRITCHETT, president of the Massachusetts Institute of Technology, has been appointed superintendent of awards at the Pan-American Exposition and will have the selection of all the juries of awards.

A GERMAN firm has secured the contract for the electric lighting of Pekin.

HON. ROBERT H. FOERDERER, who may become head of the proposed new street railway company in Philadelphia, has pledged himself to secure three cent fares, provided that it can be demonstrated that dividends can be earned with fares at that low figure.

M. FOURNIER, the French chauffeur, who led in the Paris-Berlin automobile race from the start, dashed into Berlin at exactly 11:38 Saturday morning, covered with dust. He was the first to finish the long race. A big crowd and several bands awaited the arrival of the autos, and as Fournier pulled into the city the bands struck up "Le Marseillaise," while the crowd cheered long and lustily. Kaiser Wilhelm was not present at the arrival of the Frenchman, but he met the contesting automobilists later in the day at a banquet given in their honor.

THE "L'Eclairage Electrique," of Paris, is organizing a technical excursion to the United

States to visit the Pan-American Exhibition in Buffalo, and to attend at the same place the convention in August of the American Society of Electrical Engineers. The party will leave Paris August 3, arrive at New York August 11, and leave for Philadelphia the same day. August 13 will be spent in Washington, and the party will remain in New York from the 14th to the 18th. The programme from the 18th to the 26th coincides with that of the American Institute of Electrical Engineers. From Buffalo the party will go to Chicago, and from that city by way of the Lakes and St. Lawrence River to Montreal and Quebec, returning to New York September 3, and sailing from the latter city September 5.

CHARLES H. BAKER, president of the Snoqualmie Falls Power Company, recently stated that every wheel in Seattle and Tacoma, Wash., including the street cars in both cities, is turned by electric power from Snoqualmie Falls.

THE State Department has received from John N. Ruffin, the American Consul at Asuncion, Paraguay, a report showing that the trade of that country with the United States is increasing, and adding that the prospects are that before the expiration of the present year it will have reached an unprecedented volume. "For instance," the Consul explains, "the firm of Angulo y Cia, has devoted considerable space to an exhibition of United States goods, in which, I am informed, it is doing a large and ever-increasing business, especially in agricultural implements. It expects to make many sales of carriages, electrical supplies, bicycles, dry-paints, and other articles of United States manufacture."

THE prize of \$200 offered some time ago by the Association des Industriels of France for the best insulated glove for electricians was won by Mr. Franz Clouth, of Cologne. The prize-winning glove had an electrical resistance of 52,500 megohms and in a breakdown test it withstood a pressure of 11,000 volts for three minutes and 12,200 volts for one minute before being penetrated. The glove is of rubber lined with tricot.

A NEW form of portable surgical motor, which appears to have some good features about it, says the London "Electrical Engineer," is described in the current number of the "Lancet." The 16-volt accumulator is of the sealed type, having a capacity of 18 ampere-hours, and it weighs 34 pounds. The motor itself is of the type known as the "D" pattern on account of the shape of the field magnet. The armature is a Gramme ring, and is attached directly to the shaft which carries the cable, thus taking the part of a flywheel. It weighs about 15 pounds, and is mounted on a gunmetal turn-table, which enables it to rotate and follow the movements of the operator. The entire apparatus with cases included weighs about 70 pounds. For hospital work the motor is wound to suit the voltage of the main current.

ACCORDING to French official reports, which have reached the State Department through Consul General Guenther, the demand for electric ventilators in British India exceeds the supply. American manufacturers are handicapped by the fact that the people of British India prefer ventilators with blades from 4 to

6 inches long, while those of American make are only about 3 inches long. The establishment of a depot for automobiles in Bombay is also spoken of as of great promise for business.

THE Canadian Government has ordered Superintendent Keeley of the Dominion telegraph system to establish the Marconi wireless telegraph system along the Gulf of St. Lawrence. Equipment is on the way from New York and will be taken aboard the Government steamer Tyrian at Sydney. The first station will be installed at West Point, Anticosti Island. The system will be extended as rapidly as possible until all the principal points along the gulf are equipped.

THE system of parcel express service on cars of the Metropolitan Street Railway of this city was tried June 27, when four express cars were started over the route. The first left the main offices of the New York Electric Vehicle Company, 49th street and Eighth avenue, at 5:30 A. M. and went to Fordham. A second car left the offices at 8 o'clock. Two cars were also started from the Battery. Preparations are under way to establish terminals in White Plains, New Rochelle, Yonkers, and all the towns in the southern part of Westchester County. The cars used are the old mail cars formerly employed on the Third Avenue line.

At the recent convention of the Canadian Electrical Association held at Ottawa the city of Quebec was chosen as the next place of meeting. The claims of the ancient capital were championed by Mr. Geo. Holman, of the Canadian Electric Light Company. Mr. P. G. Gossler, of Montreal, was elected president. Mr. E. E. Cary, manager of the Packard Electric Company, of St. Catharines, first vice-president, was chosen for the higher position, but on account of pressure of business, he declined to accept. The newly-elected president occupied the position of second vice-president. He is superintendent of the Royal Electric Company of Montreal. He was unable to attend the convention. The other officers elected are: First vice-president, B. F. Ressor, manager of the Electric Light and Power Company, Lindsay; second vice-president, Edward Slade, manager Jacques Cartier Water Power Company, Quebec; secretary-treasurer, C. H. Mortimer, editor of the association's official organ, the "Electric News," Toronto.

REAR ADMIRAL BRADFORD, chief of the Bureau of Equipment, will point out in his annual report the necessity of equipping American men-of-war with a system of wireless telegraphy. As soon as the appropriation is obtained he will recommend the system to be adopted for the naval service. Believing that Commander Richardson Clover, naval attaché in London, is deeply occupied with his current work, the Rear Admiral has recommended to Secretary Long that a wireless telegraph expert be sent to England to represent the navy in the trials of the two new systems developed by Lloyd's agency.

ACCORDING to the "Electrician," London, an ingenious system has been employed by MM. Georges Claude and L. Bomtes de Villiers, engineers of the French Thomson-Houston Company, for the localization of earths on conduit systems of electric traction. An oscillatory current produced by the discharge of condensers is passed through the circuit formed

by the car-wheel, rail, fault, and plough working conductor, and passes through a hot-wire ammeter on the car. A condenser is also placed in this circuit to prevent the working current from passing through the ammeter if the test is made when the rails are live. So long as the car is distant from the fault the ammeter will only show a small deflection, as the apparent resistance of the rail and working conductor to high frequency currents is considerable. As the car approaches the fault, the apparent resistance decreases to a minimum and the deflection of the ammeter increases. The high frequency current is obtained by shunting the discharge knobs of the secondary of an induction coil through two condensers and a solenoid, and tapping off two points of the solenoid. The method may be made more sensitive by regulating the capacity of the condenser in series with the conductor and fault circuit, so that there is resonance between the capacity of this condenser and the self-induction of the connecting wires when the fault is below the car.

TO-DAY the owners of property along the line of the New York Central Railroad will join in an appeal to President W. H. Newman to change the motive power of the tunnel trains from steam to electricity. Realizing that a simple request might not be sufficient they formulated a business-like proposition to pay the New York Central at the rate of \$1,000 a block to make the change.

WITH a view to doing away with the smoke nuisance an exceedingly tall smoke stack, probably the second highest in the country, has just been completed at Constable Hook, N. J., for the Oxford Copper Works. The stack is 365 feet high and is built of brick, the chimney wall at the base being 7 feet thick. The inside diameter is 16 feet at the bottom and 10 feet at the top. This chimney was built by the Custodis Chimney Construction Company of Germany. The work was carried on from a scaffold inside the chimney.

THE National Bureau of Standards was opened in Washington on Monday, July 1. For the present the headquarters of the bureau will be in the building of the Coast and Geodetic Survey, but the law creating it carries an appropriation of \$250,000 for a new building, which will soon be planned. S. W. Stratton, formerly of the Chicago University, is director of the bureau at a salary of \$5,000. He will have as his assistants one physicist, one chemist, two assistant physicists, several laboratory assistants and a secretary. The bureau will exercise its functions for the Government of the United States, for any State or municipal government in the country, or for any society, corporation or individual engaged in pursuits which require the use of standards or standard measuring instruments.

A SPECIAL cable dispatch from Paris to the N. Y. "Herald" states that some interesting experiments were conducted on Monday at Le Vesinet with a new system of wireless telegraphy invented by Colonel Pilowski, an engineer officer in the Russian army, and M. Victor Popp, a well-known electrical engineer. There is nothing spectacular in the apparatus. It consists simply of two electrodes separated by a distance that varies according to the distance of the place with which it is desired to communicate. The negative is placed on a sheet of glass as isolator on the surface. The

positive is buried in the earth at a depth of from three and a half to four meters. These two electrodes are connected to the transmitting apparatus. The same arrangement is followed at the receiving station. This is all that is necessary for the dispatch and registration of messages, as was conclusively proved by M. Popp.

A BRAKE FOR ELECTRIC CARS.

A new electric track brake and heater for electric railway cars has been invented by Mr. F. C. Newell, and is being placed on the market by the Westinghouse Company.

The brake proper, which is suspended by means of powerful springs, comprises (1) a double-track shoe of peculiar construction, combined with a powerful electro magnet which when energized by current produced by the car motors acting as generators, is strongly attracted to the rail by magnetic force; (2) brake heads and shoes of the ordinary type, acting directly on the wheels and constituting a wheel brake of maximum power and efficiency; (3) sundry castings and forgings for simultaneously transmitting the downward pull and resultant drag of the magnetic track brake into lateral pressure upon the wheels.

The combination of these three elements in duplicate, together with the necessary tie-rods and attachments, constitutes a single-truck brake equipment designed for application to a four-wheel, or single-truck car; a double-truck equipment, being the equivalent of two single-truck equipments as above described, is required for an eight-wheel, or double-truck car.

In addition to the truck equipment, either single or double, as circumstances may require, a complete brake includes brake controller attachments for use when the motor controllers are not provided with braking points, and a diverter, or improved form of rheostat, for dissipating the heat generated by any excess of current over and above that required to operate the brake when the heaters are not in service.

When the brake is not in operation, suspension springs carry the track magnets and shoes entirely clear of the rails, and by means of their flexibility, permit the shoes to ride over or clear any obstruction not sufficient to cause the car to be stopped; when the brake is applied, through the saturation of the magnets with current supplied by the car motors acting as generators, the track shoes are strongly attracted to the rails, producing three distinct effects: 1. A noticeable increase in the pressure of the wheels on the track, because of the downward pull of the magnets. 2. A pronounced retardation by reason of the friction generated between the track shoes and rails. 3. A maximum braking effect on the wheels, obtained through the transmission of the resultant drag of the track shoes to the brake shoes by means of the mechanism provided for that purpose.

It is perfectly obvious, therefore, that the net result of these three effects combined represents a much higher braking power than can be obtained by the use of any other brake without skidding wheels; moreover, the feature of a powerful track brake, which, instead of decreasing the weight upon the rails at the wheels, actually increases it, is as unique as it is valuable: it is this feature that differentiates the Westinghouse electric brake from all other track brakes of known construction. The latter have not only failed to show any advantage over the ordinary wheel brakes, but

on the contrary, have proved distinctly inferior in the braking effect secured, because of their tendency to decrease the hold of the wheels upon the rails. No advantage in making quick stops is obtained, therefore, by the use of the ordinary track brake, because, if the principle underlying its operation be carried to the extreme limit, all weight upon the wheels would be removed and the vehicle would be borne by the track shoes in sliding contact with the rails—a practice which it is scarcely necessary to say has been fully demonstrated to be far less efficient than brakes acting against the wheels without sliding. It is highly important, therefore, not to lessen but rather to increase the pressure of the wheels upon the rails.

It should be noted that while the thrust against the wheel-brake shoes, caused by the drag or frictional resistance between the track shoe and the rail, is similar in its effect to the thrust obtained from the expansive force of compressed air acting upon the brake-cylinder piston in the well-known air brake, the magnetic brake has a decided advantage over the older type in this particular, viz., that the brake-shoe pressure is automatically regulated by the condition of the rail surface. This is a fortunate feature, which results in securing the highest possible braking power at all times without danger of wheel sliding. For example, if the rail be dry and sandy, the drag of the track shoes and the consequent thrust upon the levers applying the brakes to the wheels are great; if the rail be wet or greasy, the drag of the track shoes is lessened in inverse proportion to the frictional resistance between them and the rail, thus automatically decreasing the corresponding brake-shoe pressure on the wheels.

There is still another automatic adjustment of braking effect, scarcely less interesting, if somewhat less important. It is well known that, when the motion of the car is being rapidly retarded, the forward wheels carry a somewhat greater proportion of the weight resting upon the truck; from this it follows that by placing the fixed lowerfulcrum of the forward brake-shoe lever slightly above the pin connecting it with the telescope rod, a brake-shoe pressure is applied to the forward wheels proportionately greater than that acting upon the rear wheels; when the car is reversed, the governing conditions are also reversed and entirely satisfactory results attained—the levers and connections being so designed that, when properly adjusted, the highest possible braking power is secured, without reference to the direction in which the car moves.

As previously explained, the track magnets are energized by current, obtained from the car motors acting as generators, which not only obviates any expense in that connection, but also effectually prevents the possibility of accident through sudden failure of line current. The current necessary for the required magnetization is uniformly kept within safe limits by a proper adjustment of resistance always in circuit with the brakes, thus avoiding any injurious effect on the motors.

An additional advantage gained by the use of the magnetic brake is found by employing the improved form of rheostat, or diverter, previously mentioned (which has a constant resistance regardless of the heating produced by a continuous flow of current), in the automatic control of speed down long and steep

grades. This result is owing to the fact that a certain resistance in the rheostat insures a fixed current flow at a given speed; and this resistance can be readily adjusted so as to permit just enough current to pass through the track-shoe magnets to hold the car at the required speed, against the action of gravity, on any grade; any increase in speed increases the current and causes the brakes to act with greater force, while a decrease in speed instantly decreases the current and the brake action at the same time, so that the speed of a car may be automatically regulated within narrow limits regardless of changes in the gradient.

This brake can be readily applied to trail cars by properly attaching the track magnets and accessories to them and connecting the magnetic coils to the wiring system of the motor car.

Proceedings of the Northwestern Electrical Association Convention.

The Convention of the Northwestern Electrical Association, held at Lake View Beach Hotel, Sheboygan, Wis., was called to order on June 26 by President Debell.

The President stated that the meeting would be merely the formal opening of the session. Instead of extending any formal welcome to all of the members he wished they would take it for granted that they were all welcome and hoped they would have as good a time as possible.

On motion the reading of the minutes of the last session was dispensed with and they were approved as printed.

The Delavan Light & Fuel Company, Christensen Engineering Company, Pass & Seymour and Edwin Schuette were elected members of the Association.

The report of the special committee on Gasoline Lighting was then read to the Convention by the Secretary, the substance of which was as follows:

"It would seem from the reports received that each town has lost from a few to a large number of customers by reason of gasoline competition, but that most of these people have returned to the use of electricity, showing that while gasoline may be a very cheap light, there must be great drawbacks to its general use. There are in every town lots of people looking for something for nothing, and the gasoline idea is a smooth one and catches their fancy. They do not know the origin of the fluid, its quick evaporation on exposure to the air, and its consequent danger; and it is only by actual experiment that they become convinced that it is no good, and usually after paying \$150 or more for an outfit that cost about \$25. Of course it won't do to lose sight of this fact, that where many minds and much money is concentrated on one object that it is more than likely that some day a perfect gasoline lamp will be invented, and we must be on our guard and hold our customers by giving good service and good rates. But at present it is evident that it does not seriously threaten our interests."

After listening to several communications from absentees, regretting their inability to be present, the Convention adjourned to 2 P.M.

AFTERNOON SESSION.

The afternoon session was devoted to the

reading of two papers, namely, "Incandescent Lamp Economy," by Guy V. Williams, and "Trades Training by Non-Technically Educated Men," by B. V. Swenson, assistant professor of electrical engineering, University of Wisconsin.

The papers were not discussed and the Convention adjourned to Thursday.

SECOND DAY'S SESSION—THURSDAY JUNE 27.

President Debell called the Convention to order at 10 A. M.

The following communication was read by the Secretary:

Chicago, June 26, 1901.

To the Members of the Northwestern Electrical Association, Sheboygan, Wis.

Gentlemen: On behalf of the officers and directors of the Milwaukee Industrial Exposition Company I beg to extend to you collectively and severally an invitation to attend a grand electrical exposition to be given in Milwaukee Sept. 7 to 23, 1901. I wish to assure you that this will be no ordinary exhibit; it will be patronized by nearly all of the electrical supply houses manufacturing companies and electrical manufacturing companies. The property will be brilliantly illuminated and many features, new and novel, will be introduced, such as lectures on wireless telegraphy and high tension currents, under the auspices of Tesla. In fact, everything known to the science of electricity will be on exhibition.

Your Association is especially invited to attend and will be accorded every courtesy. Room will be provided you free of charge for committee meetings or convention purposes.

The time of year is perfect so far as climatic conditions are concerned; Milwaukee is, and always will be, unsurpassed for her hospitality to strangers, and the entire Northwest will be out to see this show.

Yours very truly,

CHAS. G. ARMSTRONG.

It was moved and carried unanimously that Prof. Dougal C. Jackson be declared an honorary member of the Association.

Mr. Budd Frankensfield then read to the Convention his paper on "The Efficiency Curve of a Shunt Motor and Its Relation to Operating Characteristics and the Cost of Operation."

The President—Gentlemen, you are all familiar with the programme for this afternoon, probably from seeing it in print. The trap shooting contest I think will be a very pleasant affair. I do not know how many members there are among those present who are experts in that line, but whether you are experts or not, if you can handle a gun in any way you will I think have a chance to enjoy yourselves. The members of the Gun Club here have voluntarily offered us the use of the grounds, and will furnish all of the necessary apparatus, and some of their members will be out in attendance this afternoon to get acquainted with us and have a little extra shoot on the side if any of you are so disposed. And the games to follow I think will also be found quite interesting. The theatrical entertainment this evening will be held in the summer theater adjoining the grounds here, and they say the play is a very laughable and funny piece, and I think you will all enjoy it.

The following applications for associate membership were then placed before the meeting, approved by the Membership Committee: Kurz & Root, Appleton, Wis.; Evans, Almirall & Co., Chicago.

On motion the Secretary cast the ballot of the Association for the above as associate members.

There being no further business before the meeting the Convention adjourned sine die.

ELECTRIC TRAMWAYS—INSULATED RETURNS.

(From our London Correspondent.)

There seems to be a prospect of the Board of Trade Electric Traction Regulations, which have given rise to considerable debate at different times, being reconsidered, in fact the Board is stated to be already in communication with certain authorities upon the matter. In view of this some interest attaches to a paper read before the Municipal Electrical Association Convention at Glasgow on June 19, by Mr. J. H. Rider, the chief electrical engineer in connection with the London County Council's tramway system, under the title "Uninsulated Returns in a Tramway System." He criticized the regulations relating to the earthing of the negative bus-bar, and advocated a reduction of the maximum differences of potential (now 7 volts). Regulations 5 and 6 he regarded as not only unnecessary, but undesirable. These related to connecting any part of an uninsulated return with the negative terminal of the generator and the manner of maintaining the earth connection in good order. Mr. Rider discussed his chief points as follows:

It will be observed that the current coming back from the rails, via the earth, to the negative bus-bar, must not exceed a certain value.

The strength of this earth current will depend entirely upon two things—(1) the difference of potential between the rails and the negative bus-bar; and (2) the resistance of the earth path. The former is the fall of pressure on the return feeder, which, although it may be only a small amount, from the point of view of economy in transmission, may be enough to send a large current back through the earth, particularly if the resistance of the earth path be low. This may readily happen on account of the existence of water or gas pipes near the return feeder, and particularly when a water pipe is used as the earth plate at the generating station.

In the case of the Plymouth electric tramways, where the shortest return feeder is 760 yards long, being connected to the rails at their nearest point to the generating station, the resistance between the rails and the earth-plate (water pipe) is only about 0.5 ohm. It was found that 25 per cent. of the return current come back through the earth.

Now the resistance of the earth path can be made practically infinite, by the simple expedient of removing the earth connection from the negative bus bar.

Regulation No. 6 (1) is apparently intended to protect gas and water pipes, by insuring that no current (or only a very small amount) shall come back through the earth to the generators. Regulation No. 5 practically invites such current, and provides means for its measurement. If the earth connection be removed from the negative bus-bar, no current can come back through the earth. Why then should the connection be made?

The Board of Trade Regulations appear to provide for an earth connection at the wrong place. When the return circuit of a tramway system consists partly of uninsulated rails and partly of insulated cables, the insulated part should be kept insulated except at the point where it joins the uninsulated part, and there the earth connection should be made rather than at the other end where it is joined to the negative bus-bar.

He added that with more than one return feeder, negative boosters might be necessary to keep the points of earth connection at the rails at about the same potential. Earth currents would then be practically non-existent. With only one return feeder no negative booster would be needed, unless it were desired to reduce the fall of pressure for economical reasons. In this case it would depend entirely upon the length of the return feeder as to whether it would be better to add to its cross-section, or to use a negative booster. In the majority of cases the latter would probably prove the better way.

It was hoped that as a result of the matter coming before the Convention, weight might be brought to bear upon the Board of Trade so as to obtain modifications somewhat in line with Mr. Rider's suggestions.

NOTES ON STREET LIGHTING.*

BY BAILIE W. MACLAY.

At the present time when the incandescent gas light is being so prominently forced upon the public notice, it may not be out of place to offer this paper upon street electric lighting.

One reads of statements being made by gas engineers and others interested in gas undertakings which might lead the innocent public to suppose that the days of electric lighting, at any rate for street purposes, are numbered. Perhaps, however, the public have by this time learned sufficient of the "gassy" nature of the statements which are apt to come from those who seem now at any rate to consider us serious competitors, not to place implicit trust in their statements.

Whatever else electricity may have accomplished, there can be no doubt that since its advent in 1880, there has been a steady and even rapid improvement in the standard demanded for street illumination. Until electric light was first introduced experimentally into the City of London, the public were contented with ordinary gas burners consuming 2 to 4 cubic feet per hour. Some of the lamps at important places contained groups of burners which showed evidence of an attempt to give a better standard of illumination. It may be taken that these gas lights gave an average of from 8 to 16 cp. each. When the contract for the experimental electric lighting of some of the main thoroughfares of the city of London, terminated, and the street lighting again reverted to gas, the amount of illumination which had sufficed in previous years was found to be absolutely unbearable in comparison with the electric light to which the public had now grown accustomed, and larger gas burners, and increased numbers of them, had to be fitted along all the routes which had been electrically lighted. Even this improvement, however, was not considered satisfactory, and in due time electric arc lighting was reinstated along the principal routes of the City of London. It is doubtless true, that at the time these operations were carried out the incandescent gas mantle had not reached its present stage of perfection, but until electricity had forced the pace there seemed to be no serious demand for a higher standard of illumination at all. To-day, however, the public perpetually cry for more light in their streets, and the statement has appeared in one

of our Glasgow evening newspapers, that if there is one thing over and above pure water and effective sanitation, which is absolutely necessary in a large city, it is efficient public lighting, and to offer bad lighting in order to save money is to waste both.

Even supposing electricity had done nothing more than prove the immense advantage of properly lighted streets, it must be admitted on all hands that in that point alone it has served an extremely useful purpose.

Although electricity has been content up to the present to smile good naturedly upon the labored enthusiasm which it sees its elder sister displaying with regard to the incandescent gas mantle, in her attempt to get somewhere near her younger rival in the matter of efficient street lighting, it may be well not to remain too long silent lest it be thought that in reality the end of the street electric lighting was already in view. Everyone will admit the enormous improvement which is made by substituting incandescent gas mantles for the ordinary flat plain burner, at any rate, while the mantles are new, and during the prevalence of calm, fair weather, and it is to be hoped that the extra expense, which will doubtless fall to be borne by the ratepayers, in regard to the renewal and up-keep of mantles and other accessories of the improved system, together with the extra time required to light lamps not fitted with by-passes as compared with the older arrangement, will be cheerfully borne without a murmur in consideration of the improved illumination. There is nothing, however, in all this to show that for main thoroughfares, where a really brilliant illumination is desired, incandescent gas can in any way equal, far less surpass, electric light. A great deal has been made of the argument that electric lighting is "patchy," giving a brilliant illumination within a certain radius from the lamp and a comparatively poor illumination at points midway between, and great efforts have been made to show that by converting the ordinary flat flame gas lamps into incandescent mantle lights, the illumination is much more evenly distributed although it may not be so intense at points near the lamps. This, however, has been investigated by electrical engineers and it has been found that an equal standard of lighting, measuring the light at points midway between the lamp columns, cannot be obtained in this manner, except by using such a number of incandescent gas mantles that the cost will be more than that of electric lighting to give the same result.

Apart from this, however, it is interesting to note that the gas people themselves are devoting their greatest energies to developing incandescent mantles, which they hope will give as large, concentrated and brilliant a light as can be obtained from the electric light. It would seem therefore that their anxiety in this direction goes entirely to disprove their own arguments.

On a recent occasion the question of lighting the Great Western Road, which may be styled the most fashionable promenade in Glasgow, was very prominently before the public, and was discussed very fully by the Town Council as well as by the sub-committee dealing with the matter. The question in this case was to some extent mixed up with that of lighting the tramway poles which had been fixed along the center of the road at distances of about 40 yds. apart. There was a very strong feeling amongst the public in favor of electric light-

* Paper read at the Municipal Electrical Association Convention, Glasgow, June 19, 1901.

ing, although incandescent gas lighting has been proceeded with along a considerable portion of the route and was showing a great improvement over the previous state of affairs. It was ultimately decided to do the lighting by means of electric lamps placed at a height of 27 feet from the road level to the center of the arc, each lamp being constructed to take 7 or 7½ amperes and to give about 700 cp. Counter proposals were made that gas mantles should be placed upon the tramway poles, but even supposing that the vibration of the poles did not have disastrous effects upon the mantles it was found impossible to produce an equal standard of illumination at any reasonable cost in this manner, except by introducing side lamps at intermediate points, and even then it was found that the cost for the same amount of illumination at the darkest points would be greater with gas than with electric light. In every case full benefit was given to the incandescent gas mantle, as it was credited with 50 cp. per mantle, this being a figure which doubtless may be obtained at the first start, but which public experience goes to prove is not maintained for very long. Of course no variations occur with electric arc lights due to the deterioration of the illuminants, and, provided the supply or current remains the same, the light is the same, year in, year out.

Probably a point which has to some extent escaped notice is the fact that lights placed high up give a much more pleasing effect than when fixed low down, even though the illumination may be uneven. It is possible that a very even illumination might be gained with a large number of closely spaced lamps of low candle power placed low down, but the effect would also be depressing in the same way that the lighting of a large hall is depressing unless the illumination extends to some extent upwards as well as downwards, or more correctly, unless the whole cubic contents of the hall are illuminated. In this way when walking along a large street or thoroughfare lighted with electric lamps at a considerable height, one feels a sense of airiness and magnitude which is missing if the lights are fixed low down.

It is not the object of this paper to discuss in any way the question of comparative costs, but it may be well to state that the 7 ampere lamps before referred to will be charged for at the rate of £12 per lamp per annum, every lamp burning the whole night through. This charge includes the maintenance of the lamps, supply of carbons, trimming, cleaning, and the supply of current, but the capital expenditure, except so far as the mains are concerned, is borne by the Police Department, and is not provided for in these charges. Gas has been taken at the present price of 2s. 6d. per 1,000 cubic feet, and what is known as the ordinary 50 cp. mantle has been allowed its fullest efficiency, which in the author's opinion is considerably more than it is entitled to. The prices which will prevail in Glasgow next year for 10 ampere arc lamps under similar conditions to the above will be £14 per lamp per annum.

So far it would seem that incandescent gas lighting in streets is not unlikely to have the same result as it has had in house lighting. It has been observed by those in a position to know that the ordinary consumer of electric light goes through three stages:—first, ordinary gas; second, incandescent gas, and third, electric light; and for this reason electricity supply authorities cannot but welcome the improvement over ordinary gas which the gas mantle

promises. No one who ever used incandescent gas is satisfied to go back to ordinary gas, and when thoroughly sick of incandescent gas the final plunge is taken into electric light, from which no one ever goes back. We may therefore take it that street lighting is now entering upon the second stage from which the only possible development must be an upward one, i. e., into electric light. In other words, the incandescent gas mantle is now acting in a similar manner towards electricity to that in which electricity itself acted towards gas in 1880.

THE SOCIAL ENGINEER—A NEW FACTOR IN INDUSTRIAL ENGINEERING.*

BY DR. W. H. TOLMAN.

In the changed industrial and economic conditions of to-day, the great concentration of capital and the massing of thousands of the employed, have brought about new problems. In the old times, master and man lived and worked together—there was a daily point of contact, a continuous personal touch. To-day all is changed. The employer, in many cases, is as much of an absentee as were the nobles in France in the latter part of the eighteenth century and the landlords of some of the worst tenements in slumdom. With the growing intelligence on the part of the workers, evidencing itself in a dissatisfaction with their social and economic surroundings, they are slowly learning how to crystallize their incoherent wants and their smothered discontents into definite propositions for an improvement of their conditions.

The personal touch between employer and employed has largely been lost, and it is not desirable, even if it were possible, to return to the earlier days. But for the successful conduct of the business of the twentieth century a point of contact must be sought for and established, though in a different way. This need has created a new profession, that of the "social engineer," a man who can tell the employer how he may establish a desired point of contact between himself, his immediate staff, and the rank and file of his industrial army.

On one occasion an employer of 5,000 men asked me what form of industrial betterment he could begin. This led to a few questions on my part. First, were the men allowed to drink beer on the premises, especially at the noon hour. "Oh, no!" was the answer, "we are very strict about that." Secondly, I inquired whether any rooms were provided in the factory where the men could eat their lunch, or any kind of shelter outside to protect them from the hot sun in the summer. I found that nothing was provided. In summer they were obliged to eat their luncheon in the shadow of the buildings; frequently their heads were shaded while their bodies were exposed to the hot sun. Under these conditions it was not surprising that the men went to saloons where they could have their beer and the privileges of the free lunch counter in comparatively cool and comfortable rooms.

To change these conditions I advised the fitting up of a room with plenty of windows and fresh air, and a temporary shelter in some part of the yard for summer use. I reinforced my suggestion by the instance of a certain factory where one large room is furnished

with tables and benches. A kitchen is provided where plain, substantial food is furnished at cost price. The men are divided into sections, and are given cards on which they write down their orders for the following day. One of their own number serves as waiter, going to the kitchen five minutes before the whistle blows to get the tray with the food which has already been placed there, corresponding to the written orders given on the cards. As soon as the men are seated at the tables the food, smoking hot, is placed before them, so that there is not a moment's loss of time. The average price of a meal is 15 cents.

After dinner they may adjourn to one end of the room, where are tables filled with reading matter, trade papers, technical journals, magazines—in fact, just the kind of reading matter that will appeal to the man at the bench who has a few minutes' leisure after eating. The men are also allowed to smoke for half an hour after they return to their work. The manufactured product is such as to permit this privilege in nearly all the rooms. There are very few factories where smoking could be allowed, but the fact that it is allowed here shows that the employer is willing to do all in his power for the comfort of his men. My visit to this factory happened on a Friday, when a religious talk of seven minutes is given to the men after luncheon. The speaker gave the men a straight-from-the-shoulder gospel talk on the Prodigal Son. I watched carefully to see how many would stay for the talk. With the exception of about twenty men, who were reading, the remainder, 180, stayed for the talk. When you consider that the men took their own time to listen to the religious talk, it is very significant. Since the establishment of this factory lunch-room three saloons in the neighborhood have gone out of business, and the fourth is having a hard time. In this particular factory the men appreciate the co-operation of their employer, and show it; however, in the majority of cases appreciation is not expressed, even if it be felt, but that fact does not lessen the obligation of doing one's duty. "Noblesse oblige" was never truer than to-day.

One of the first steps, in the writer's opinion, towards improving the condition of the employed is the provision of clean and comfortable rooms where men and women may eat their mid-day meal away from the noise, dirt, and routine of the work-bench or machine. The most far-sighted employers have been quick to see that taking care of their employes was good business, and have fitted up kitchens where a warm meal of plain, substantial food may be served at cost. The captains of industry are slowly learning a lesson from the captains of war, who lay great store on the physical equipment of their army, fully recognizing that the best-fed and the best-nourished soldier is the most efficient.

For the purpose of stimulating the employe to do his best, an increasing number of employers are offering cash awards for the best suggestions from their staff. In one large company a wagon driver called the proprietor's attention to the poorly paved streets about the freight stations, stating that he was never able to haul a full load of merchandise, to say nothing of the needless wear and tear on the horses and wagons. The attention of the city authorities was called to the poor paving, with the result that the streets are now in a proper condition. Thus the whole city gained by the

* From "Cassier's Magazine."

suggestion made by one driver to an employer who had drawn him out by the offer of an award for suggestions.

Closely allied to industrial betterment is social betterment, for every movement adding beauty, comfort, and satisfaction directly promotes a better communal feeling. In line with this thought, the engineering department of the New York Central Railroad has established a system of horticultural gardens and greenhouses, from which plants and shrubs may be prepared for use at the various stations, and trailing vines are supplied for the purpose of covering up the bareness of fences, poles, and buildings, adding beauty by the subtraction of ugliness. This form of social betterment is not confined to the New York Central Company. It can be extended still further, for there seems to be no reason why the employes of the road should not be supplied with the vines, plants, and shrubs for their own home adornment, at cost, and, under certain conditions, free, provided that they would agree to plant and care for a definite amount. By that means each employe becomes a "missionary of beauty," bringing the delight and pleasure of the flowers not only to his own home, but to the community.

In advising an employer what form of industrial betterment he will find the most important, I place a provision for a home, which, after all, is the true social center. In the workshop, the worker is under discipline; his course of action is thought out for him, and he thus becomes a part of the system, a cog in an intelligent machine, so to speak. In his home he is absolutely free; if the surroundings are such as to keep him in good health, to enable him to enjoy the charms of family life, he becomes a better man and a better citizen.

There is a direct relation between capital, labor and management, the three essential elements necessary to every enterprise. Consider how useless is capital without management to direct its resources, and, in turn, how both capital and management are dependent on the willing hands of labor to execute their will. Capital should conscientiously do all in its power to improve the condition of the workers, for a more vigorous man is able to do more work, a more intelligent man will do better work, and a more conscientious man will do more faithful work. On the other hand, labor should not view with cold suspicion the overtures of capital, but should meet them in a friendly spirit, with a mind open and ready to co-operate. Many employers have found that their efforts for industrial betterment have been met with surly looks, suspicion and indifference.

But it is not fair to expect the employer to do all. The capitalist should not be regarded as a thief and robber; labor should recognize the sincerity of his motives, and give him a chance to prove his sincerity by working with, and not against him.

The United States Leads With Patents.

It is interesting to note that, while there has been a falling off in the number of patents granted to citizens of Great Britain and also to citizens of Germany and France, the number of applications from the United States increased from 3,002 filed in 1899 to 3,189 in 1900.

VILLAGE EXCHANGES AND FARMERS' LINES.*

BY S. P. SHEERIN.

One of the many good fortunes of the farmer is to have constantly at hand some man (or men), from any or all the other vocations of life, ready and willing to tell him what he ought to do. I regret to say, however, that, notwithstanding the very excellent opportunities afforded him to follow the advice of other people, the farmer still persists in having a will and a way of his own. With all due respect to our farmer friends (and in my high regard for them I allow no man to go before me), I do not believe that they yet appreciate the great blessing the telephone has brought them.

The telephone—which after all, has only had its development in the last six or seven years—is a greater boon to farmers than to any other class of people. The great drawbacks of country life are its isolation, its meagre opportunities for social intercourse and its still fewer opportunities for protection.

When we add to these the disadvantages of being out of touch with the market and out of reach of the great news pulse of the country the sum of the country life's shortcomings is complete.

The telephone changes all this. It comes as a benefactor, exceeding all others in its possibilities and usefulness. No man can fully estimate its benefit to the farmer. It brings his ear close to the market tickers of the world; brings the weather report to his door in time to protect his crop and cattle, and travels, what would be to him and his horses, weary miles, in the ordinary transaction of his every-day business.

The telephone should be welcomed by the farmer—with open heart and ready hand—to the best of everything he has. I regret to say that this is not always done. Our farmer friends still insist, in a great many localities, upon being somewhat beggarly in their treatment of the telephone.

The telephone cannot (any more than any other agency) perform its proper functions except under fairly good conditions. It is entitled to the very best we can give. It is no longer an experiment; it has demonstrated its usefulness and its right to a fore-front position in the economies of life as completely as have the locomotive, the steamboat, the reaper and the threshing machine. It was extremely unfortunate in its birth, and its boyhood associations were not good; but it is fast approaching a glorious American manhood—"redeemed, regenerated and disenthralled."

Men do not now hesitate to put sufficient money into railroads; the steamboats on our lakes and rivers are perfect floating palaces, and the wise farmer pays a good price and gets a good article of reaper and threshing machine when he has reaping and threshing to do. It is, I am afraid, a slight reflection on the usual good sense of the average farmer who has progressed, in other respects, out of the cheap way of doing things, to find him insisting upon putting up cheap, grounded telephone lines, on native poles, 300 and 400 feet apart, marring the landscape and furnishing temptations to profanity by those who have to use them. A poorly constructed and badly managed country telephone line is many times worse than no telephone at all. There was a time when those

*Paper read at the meeting of the Independent Telephone Association, Buffalo, N. Y., June 12, 1901.

things served their purpose as educators, but that time has passed.

The large-letter primer (while a very excellent thing in its place) is not to be considered as a means of education by the chap who has reached the fifth reader, and is already fishing his jaw-breakers out of the Century Dictionary. We live in a progressive country. It is our duty to progress with our neighbors. We have no business to be clogs upon the wheels of progress. It is the duty of every fair-minded citizen to undertake to discharge, faithfully and well, his fair share of the obligations of citizenship. The farmer who fails to do this falls short of doing his full duty. The country telephone is fast becoming the most important feature of rural life. It should be treated with the respect and liberality which is its natural due.

The country telephone line (and all other telephone lines which go along the country road) should be considered as part and parcel of the road itself. They should not (in my judgment) be considered as tenants of the road, or as something that is there by sufferance, or by permission—grudgingly given—of those who, for the time, do not appreciate its advantages; but it should be regarded as a part of the road itself.

One of the primary functions of roads was that of facilitating messages between civilized peoples. The savages of the forest used their foot and bridle paths to transmit messages of peace or war, love or hate. Civilization early found its use for the messenger, and so well were his rights established that, I believe, it was laid down in the early common law that the pedestrian, bearing a message along the public highway, has rights superior to the horseman. The telephone is a messenger. More than that, it is a troop of messengers. It carries from home to home, from heart to heart, the messages of the people. It should be as highly regarded and as free from interruption on the highways of the country as the bearer of a writ of habeas corpus. There are no other means by which messages can be transmitted with so little wear and tear to the roadway.

I look forward to the time when telephone lines will be regarded as such sacred property that men and boys will no more think of interfering with a country telephone line than they do now of throwing stones at windows or killing song-birds as they pass along.

In order, however, to be entitled to this high regard of the public, the telephone must by its outward appearance, command the respect of the people. We are apt to say sometimes that "clothes do not make the man." I think this is true; but we cannot deny that outward appearances go a great way toward giving good or bad impressions of people and things.

Telephone lines should be substantially and neatly constructed. They should be of the very best material—good, heavy, well-shaped poles (no pole shorter than 25 feet nor smaller than six inches diameter at the top); cross-arms should be of regular length, and the wire put on in a thoroughly mechanical manner.

I have an impression that, as time goes on, and our high regard for the telephone increases, we may get along with shorter poles, and put our wires as near to the ground as electrical conditions will permit. My thought is that we will not have to use very high poles anywhere except at road crossings, and it is barely possible that we may reach a condition where

it will be found easier to go under cross-roads than over them.

Wherever it is possible, I think that not more than one line of poles should occupy the same side of the road. It will be entirely possible to build a line sufficiently strong and symmetrical to take on all the lines that should go along any particular roadway.

Of course, it goes without the saying that all lines should be iron or copper-metallic, and, as nearly as possible, the maintenance of the whole line should be under the control of one head, without reference to how many persons or companies may be interested in the pole line.

One of the great troubles of the country telephone line—as, indeed, it is one of the drawbacks we all have in cities—is the trees. In the cities we are able to escape this annoyance very largely by the use of cable; but of course it would be impossible to do this in the country. Not taking into account the great additional cost of that sort of construction, there are electrical considerations that make a continuously long cable line an impossibility. The trees on the country roads should give way to the telephone.

I am an advocate of trees, and believe that we should cultivate our forestry in every possible way consistent with the discharge of our other obligations. But as it was necessary to trim away the original forests to make the roads, so I would trim away the trees along the side of the roads which interfere with that part of the road belonging to the telephone. Trees along highways, near residences, can just as well be set back 25 or 30 feet. They have no business on the highway or overlapping the highway, when they interfere with the uses of the highway.

The telephone is the proper use of the highway. In many respects it is the most important use. Being a comparatively new thing, it may take legislatures and courts a little while to appreciate this, but just as surely as our American legislation and jurisprudence have found a way to clear all other obstacles from the path of material progress, so they will find a way to order the trees along the highways set back out of the way of the telephone. They will do this because the people will demand it—and the people, here, always get what they want.

Now as to the village exchanges: I believe they ought to be made just as numerous as the wants of the people may require; in fact, I think a number of small exchanges is infinitely preferable to a number of long, heavily laden party lines. There is not only utility in this, but a good deal of economy as well. The larger the number of people to be reached and the quicker we can reach those whom we desire to communicate with, the better our service will be.

In my judgment, village exchanges should be encouraged everywhere, and these village exchanges should have direct communication with the county seat exchanges and exchanges in the other towns of the county, and these latter exchanges in turn should be connected with the long distance exchanges of the several States. Our combination of lines and exchanges should be so complete that the farmer, sitting at his own hearthstone, can communicate by telephone with anyone, no matter where located, to whom he desires to speak.

The equipment of these country exchanges should be, in all respects, first class. I regret

that this is not always the case. It is often very poor, and I now wish to show some of the causes for this.

With all due respect to the manufacturers—and I think the manufacturers are entitled to a great deal of credit for the development of the telephone business—I cannot help the feeling that they are very largely responsible for a great lot of shoddy, inefficient and wholly abominable telephone equipment in the country. They go upon the theory that the farmer wants something cheap, and that the way to catch him is to present a very low-priced article, without very much reference to how long it will last or what service it may give him in the meantime. This is little short of criminal, and cannot be too strongly condemned.

This association, and all other people largely interested in the telephone business who want to escape responsibility for bad service by other people, as well as by themselves, should set their faces firmly against the manufacturers who make especially "Cheap John" equipment for farmers' lines.

The truth is that, for many reasons, the farmer ought to have better equipment than anybody else. It is very much more difficult for him to get repairs than it is for anyone else; in the very nature of things, he soon becomes very much more dependent upon his telephone than does the man living in the city, where distances between business associates and neighbors are very much less, and where other facilities for communication are very much more numerous.

Another explanation for bad equipment in the country is the very short-sighted practice indulged in by some city companies of selling their worn-out material to farmers at reduced prices. A chain is only as strong as its weakest link; the telephone or switchboard that is not fit for use in town is certainly not fit for use in the country. "Good equipment every where" should be the motto.

The battlefield of the great telephone war which has been raging in this country for the last five years, with the victories always on the same side, has been largely transferred from the cities to the country. The Bell companies, in the days of their monopoly—and, in fact, until quite recently—positively refused to furnish service to the farmer upon any terms. Now they have changed their minds about that, and seem to have concluded that the farmer and the villager are not such bad fellows after all. But their repentance has come too late. The farmer and the villager have been doing a thing or two for themselves, in the meantime. And this is part of what they have done in Indiana. I feel that you will pardon me for talking a little of my own State.

We have had a most desperate fight in Indiana for the last five years, notably for the last two years. We have been threatened by the opposition with everything from total annihilation to everlasting abode in eternal darkness. We were assured upon the honor of the very clever gentlemen who manage the Central Union Telephone Company that we would lose every dollar we put into the telephone business, with the further cheerful assurance that they knew what they were talking about, and would personally see to it that their prediction would come true. In furtherance of this last determination, they spent a good deal of their "war appropriation" in superhuman efforts to prevent our people from putting money into

the telephone business. It would be amusing, now, to read some of their statements. We learned long ago in Indiana that the immortal Lincoln was right when he said that, while one might fool part of the people all of the time, and all of the people part of the time, he could not fool all the people all the time.

When the first Independent telephone exchange was constructed in Indiana, the Central Union Telephone Company had been paying, for 12 years, on a capital of \$6,300,000 (three-fifths of which was pure water), annual dividends ranging from four to six per cent. It had no bonded indebtedness and no floating indebtedness that was reported.

When the fight with the Independents began it ceased paying dividends—the last one being paid in 1895. In 1897 it borrowed two and a half millions of dollars; in 1899 it borrowed six millions of dollars, two and a half of which was set aside to pay the holders of the first mortgage of two and a half millions. The company now has, in addition to this \$6,000,000 mortgage (according to recent publications), a floating indebtedness of \$1,250,000.

Now, let me tell you what all this has resulted in: The Central Union now has (as shown by its own figures) 22,000 telephones in the State. The real number is smaller than this, but we can afford to be generous, and I propose to give it all it claims. The Independent telephone interests have in the State of Indiana by actual count 52,469 telephones. I know you will excuse me if I repeat those figures. After a "war expenditure" of seven and a quarter million dollars—begun upon the Independent movement when there was less than 3,000 Independent telephones in the State—the Central Union now has, for its expenditure, 22,000 telephones, and the Independent movement has 52,469.

The total population of Indiana (according to the census of 1900) is 2,516,000. There are 92 counties in the State, and there are 27 of these in which neither the Central Union nor any other Bell Company has an exchange, large or small. The population of these 27 counties aggregates 491,000, and the aggregate number of Independent telephones in these 27 counties is 14,262. The total number of Central Union and other Bell Company telephones used at toll stations only in those 27 counties is 197.

I submit this Indiana statement more especially for the benefit of our friends in different parts of the country who are just beginning their fight with the great monopoly. If you ask me how they fought us, I can simply say—every way. If there is any mode of guerilla warfare that they left untried, we have not been able to find it. The Independent development in Indiana has been accomplished by Indiana self-helpfulness and Indiana capital. Of the millions invested in the Independent telephone business in Indiana, less than \$100,000 has come from outside of the State. More than that, the business is practically out of debt. The total indebtedness upon the Indiana Independent telephone property is less than 10 per cent. of its total value.

In this great success the farmers and villagers of the State have been of incalculable help. They realized (as all sensible men, similarly situated, must have realized) that their only hope was in becoming a part and parcel of the great Independent movement.

The Independent movement gives opportunity for self-helpfulness and intelligent co-

under the title "The Mechanism of Radiation," attempted to obtain answers to the two following questions: (1) What inferences can be drawn as to the mechanism by which radiation is emitted from an examination of the formula of physical optics? (2) Is it possible with the help of these inferences to frame any conception of matter which will give a consistent account of the various optical phenomena?

Mono-Rail Electric Line for London.

In connection with an elaborate project now working out for the better handling of its traffic at the central terminal stations in London, the South Eastern Railway Company has decided to set up a short length of Behr's electric mono-rail between the Cannon street and London Bridge Stations. The existing lines, which are worked by steam locomotives, will be preserved very much in their present condition, but the mono-rail track will be carried above them at such a height as will enable them to clear the tops of the carriages. Small high-level stations will handle a two minute service, the course being so arranged that a round and round continuous service will be possible without in any way interfering with the steam lines beneath. The expenditure is set down as about \$500,000. The better reception given to the mono-rail idea before Parliamentary Committees this year has doubtless had a good deal to do with this development. We may add that the Manchester-Liverpool project has passed the House of Lords and now merely awaits the decision of the House of Commons. It is hardly likely to meet with defeat there.

CANADIAN NOTES.

(From our Ottawa Correspondent.)

The Imperial Electric Light Company held its annual meeting at Montreal on June 25 and declared a dividend of 7 per cent. on its year's operations. Reports of the officers indicated a very prosperous condition. At the directors' meeting, subsequently, Mr. Victor Morin was elected president, Dr. Chagnon treasurer, and Mr. E. J. Chapeau managing director.

The offer of the Ontario Telephone Company to establish an independent telephone system in the city of Toronto, has been considered by a special committee of the city council, which has recommended that a contract be prepared to lay before the council. The offer is to install an up-to-date system, underground, in the center of the city and giving each subscriber a metallic circuit, the cost to be \$36 per annum for business phones, \$24 for house phones, and the two for \$50. The incorporators of the company are Henry H. Perkins, of Buffalo, N. Y.; Henry D. Kirkover, of Fredonia, N. Y.; Chas. B. Hill, Buffalo; S. E. Wayland, manager of the Wilkes-Barre and Scranton Independent Telephone Companies, and J. B. Ford, the promoter.

In respect to the electrical development by the Clergue Syndicate at Sault Ste Marie, Mr. Clergue says: "We do not contemplate erecting a steel plant on the American side. We are only developing power there. A canal is being dug which, when completed, will realize 50,000 horse power. Of this 20,000 hp. has been leased to the American Carbide Company of Chicago, and 15,000 hp. to the American Alkali Company, a firm which manufactures bleach-

ing powder and caustic soda. On the Canadian side we have developed 20,000 horse power and are developing 40,000 more, so we will shortly be producing 60,000 horse power, or 10,000 more than is being produced on the American side. Most of the capital to provide this development has been supplied by Philadelphians. The wealthy men of Philadelphia will not invest in anything but a good proposition."

Exports of Electrical Material from New York.

The following are the exports of electrical material, from the port of New York, for the week ended June 26:

Amsterdam, 1 box, \$15; Anam, 18 packages, \$1,030; Antwerp, 2 cases, \$200; Argentine Republic, 2 cases, \$158; Australia, 74 packages, \$17,708; Barcelona, 29 cases, \$7,000; Brazil, 75 packages, \$4,186; Bremen, 1 package, \$40; Bristol, 8 cases, \$4,000; British Possessions in Africa, 88 packages, \$3,778; British East Indies, 22 packages, \$3,153; British West Indies, 3 cases, \$51; Brussels, 8 packages, \$250; Central America, 72 packages, \$1,043; China, 3 cases, \$38; Christiania, 1 package, \$8; Cuba, 101 packages, \$3,399; Ecuador, 145 cases, \$3,133; Florence, 3 cases, \$50; Glasgow, 24 packages, \$3,830; Hamburg, 3 packages, \$340; 33 cases, \$4,778; Havre, 4 cases auto vehicles, \$2,880; 22 cases, \$1,672; Hayti, 31 packages, \$282; Helsingborg, 5 cases, \$90; Hong Kong, 1 case, \$50; Japan, 55 packages, \$8,277; Leicester, 2 cases, \$190; Liverpool, 40 packages, \$3,613; London, 266 packages, \$7,857; Manchester, 1 case, \$347; Mexico, 82 packages, \$1,294; Milan, 56 cases, \$1,698; New Foundland, 7 packages, \$355; 6 cases, \$178; New Zealand, 39 packages, \$3,686; Patras, 77 cases, \$7,831; Peru, 168 cases, \$9,727; Philippines, 43 packages, \$1,578; Santo Domingo, 554 cases, \$3,903; Siam, 263 packages, \$21,134; Southampton, 16 cases, \$2,000; Suez, 1 package, \$10; U. S. Colombia, 41 cases, \$385; Venezuela, 181 cases, \$1,080.

PERSONAL MENTION.

Mr. E. A. Leslie has been appointed general manager of the Edison Electric Light Company of Brooklyn, N. Y.

Mr. Garret Van Ginkel, late president of the Dallas, Tex., Consolidated Street Railway Company, was killed by one of the cars on the Exall Lake line June 19.

INCORPORATIONS.

The Electric Depot Company, Detroit, Mich. Capital stock, \$50,000. Shareholders: Claud B. King, John H. Fry, Joseph J. Bampton, William C. Hooper and R. W. F. Peters.

The Forster Electric Light Company, Chicago.—to deal in electric machinery and appliances. Capital stock, \$250,000. Incorporators: A. A. Rolf, J. E. Takken and P. J. Karstens.

The Henderson Electric Light & Planing Mill Company, Henderson, Tex. Incorporators: A. Wettmark, E. B. Felford and W. P. White.

The Prosser Electric Company, Prosser, Wash. Capital stock, \$3,000.

The Centralia Electric & Power Company, Centralia, Wash. Capital stock, \$100,000. Incorporators: T. Hass, H. Hass and T. Hass, Jr.

The Prevalent Prune.

Mr. George H. Daniels, of the New York Central road, has arranged to fill all the people full of prunes before they reach the Buffalo Exposition. Prunes are to be found on the menu of the dining car service in every shape and form, and the superintendent of chefs is now experimenting on a prune rarebit.—From the "Washington Post."

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED JUNE 25, 1901.

ELECTRIC RAILWAYS AND APPLIANCES.

676,888. Electric-Railway System. Emmerich Frischmuth, Berlin, Germany, assignor to the Siemens & Halske Electric Company of America, Chicago, Ill. Filed Feb. 12, 1900.

677,026. Electric Brake. Frank W. Garrett, Johnstown, Pa., assignor to the Lorain Steel Company of Pennsylvania. Filed Oct. 24, 1900.

677,069. Car-Fender. Fred P. Dow, Fredericton, Canada. Filed Feb. 4, 1901.

677,145. Combined Brake and Power Controller. Emmett W. Stull, Johnstown, Pa., assignor to the Lorain Steel Company of Pennsylvania. Filed Sept. 28, 1900.

677,262. Trolley. Alexander Palmros, Columbus, O., assignor to Joseph A. Jeffrey, same place. Original application filed Oct. 9, 1899. Divided and this application filed April 29, 1901.

ELECTRIC LIGHTS AND APPLIANCES.

676,952. Electric Lamp. Charles A. Hussey, New York City. Filed Oct. 29, 1900.

677,005. Feeding and Regulating Mechanism for Arc-Lamps. William E. Waldron, Colorado Springs, Col., assignor of one-half to Andrew J. Lawton, same place. Filed Feb. 6, 1901.

677,019. Electric Arc Lamp. Frank M. Conway, New York City, assignor to the Imperial Electric Lamp Company, same place. Filed July 18, 1898.

677,049. Electric Lamp Cluster-Fixture. Nelson Weeks, New York City. Filed Oct. 4, 1898.

677,298. Incandescent Lamp. Isidor Kitsee, Philadelphia, Pa. Filed March 2, 1900. Renewed April 23, 1901.

ELECTRICAL MACHINERY AND APPARATUS.

677,027. Operating Means for Electric Controllers. Frank W. Garrett, Johnstown, Pa., assignor to the Lorain Steel Company of Pennsylvania. Filed Nov. 27, 1900.

677,038. Control of Electric Motors. Frank A. Merrick, Johnstown, Pa., assignor to the Lorain Steel Company of Pennsylvania. Filed Nov. 14, 1900.

677,071. Collector for Electric Generators and Motors. Arthur H. Eddy, Windsor, Conn. Filed March 27, 1901.

677,191. Electric Controller. Arthur C. Eastwood, Cleveland, O. Filed Feb. 6, 1901.

677,245. Apparatus for Making Secondary-Battery Plates. Albert F. Madden, Newark, N. J. Filed March 19, 1901.

677,269. Reversible Snap-Switch. Guy H. Proctor, Somerville, Mass. Filed Oct. 17, 1900.

677,308. Alternating-Current Motor. Carl Eickemeyer, Mary T. Eickemeyer and Rudolph Eickemeyer, Jr., Yorkers, N. Y., executors of Rudolph Eickemeyer, deceased, assignor to the General Electric Company, Schenectady, N. Y. Original application filed July 6, 1894. Divided and this application filed Jan. 24, 1901.

TELEPHONES AND TELEPHONE APPARATUS.

676,955. Telephone System. Frank A. Lundquist, Chicago, Ill., assignor to M. E. Richardson, trustee, Sterling, Kan. Filed Dec. 29, 1899.

676,956. Calling Device for Telephone-Exchanges. Frank A. Lundquist, Chicago, Ill., assignor to M. E. Richardson, trustee, Sterling, Kan. Filed Jan. 8, 1900.

MISCELLANEOUS.

676,949. Electric Heater. Gardiner C. Hawkins, Boston, Mass., assignor to the Bay State Electric Heat & Light Company, Jersey City, N. J. Filed Sept. 26, 1898.

676,950. Heating Apparatus. Gardiner C. Hawkins, Boston, Mass., assignor to the Bay State Electric Heat & Light Company, Jersey City, N. J. Filed Oct. 3, 1898.

676,965. Means for Recharging Storage Batteries of Electric Vehicles. Joseph Sachs, Hartford, Conn. Filed Oct. 5, 1900.

676,985. Electric Smelting-Furnace. Hugo Koller, Nuremberg, Germany. Filed May 17, 1900.

677,070. Electrical Heating-Furnace. Arthur H. Eddy, Windsor, Conn. Filed June 15, 1900.

677,156. System of Charging Storage Batteries. George H. Condit, New York City, assignor to the Electric Vehicle Company, same place. Filed Aug. 4, 1898.

677,169. Alarm Apparatus for Engine-Room Telegraphs or the Like. Thomas Bell, Liverpool, Eng. Filed Sept. 23, 1900.

677,226. Method of Producing Electrical Energy from Carbonaceous Materials. Hugo Jones, Chicago, Ill. Filed July 8, 1899.

677,244. Secondary Battery. Albert F. Madden, Newark, N. J. Filed March 19, 1901.

677,247. Electrically-Operated Plow. Conrad Meissner, Friedrichsberg, Germany. Filed Dec. 31, 1900.

REISSUE.

11,916. Electric Arc-Lamp. Edwin W. Rice, Jr., Schenectady, N. Y., assignor to the General Electric Company of New York. Filed May 1, 1901. Original No. 641,591, dated Jan. 23, 1900.

THE TELEPHONE WORLD.

Judge Brown's Decree Opens Telephone Field.

The decision by Judge Brown in the United States Court in Boston on June 27, in the case of the American Bell Telephone Company vs. the National Telephone Manufacturing Company and the Century Telephone Company, a proceeding involving the validity of the Berliner patent, has made operative hundreds of patents on transmitters and telephone improvements that were formerly held to be useless because they were infringements on the patent held by the Bell Telephone monopoly.

There are hundreds of claims for patents pending in the Patent Office at Washington, which have become valuable in the light of the Massachusetts court decision. Of course the Bell Company has appealed from Judge Brown's decision, but the holders of patents are sanguine that he will be sustained by the higher court.

Officials of the United States Patent Office declare that the field is now open for the organization of independent companies wherever sufficient capital can be raised to build a plant, for there is no longer a monopoly on the basic principle of a successful commercial telephone.

For the past twenty years the Bell people have controlled the main patents on the parts of a telephone necessary to construct anything more than a mere speaking tube.

The original Bell patent was only for limited use until the syndicate secured the exclusive right to the Berliner patent on an improved contact transmitter.

An official of the Patent Office in discussing this decision said:

"As the matter now stands the Bell people no longer have a monopoly on the Berliner transmitter, and the most important element in a commercial telephone is now open to free use.

"The decision of the court is in effect a rebuke to the Patent Office, for it was held that we had no right to issue the second patent, which amounted in effect to a re-issue of the original patent.

"There are any number of patents that have been issued on transmitters and other parts of telephones which will now possess considerable value, and which were formerly worthless because they were held to be infringements on the rights of the Bell Telephone Company.

"I presume that companies will be organized in various parts of the country for the purpose of giving independent service, and we may look for a big drop in the price of telephone service."

Lighthouse Telephones.

An innovation, which will be greatly appreciated by all mariners passing through the waters of Long Island Sound has been introduced at the Stratford Point lighthouse by the installation of telephonic connection.

The instrument was recently placed in position by the Southern New England Telephone Company in response to many requests from the owners of vessels engaged in the coasting trade, and it is expected that it will fill a long felt want.

A pay station has been established, thereby entailing no expense to the Government, and a sign to this effect has been placed in position near the light, so that it may be read by the masters of passing vessels with the aid of a glass.

It will now be possible for those desiring to obtain information from Captain Theodore Judson, the lighthouse keeper, regarding the passage of steamers, tows and other craft through the Sound. Such news is oftentimes required by the owners or those to whom cargoes are consigned, but has never in the past been accessible.

The steamboat companies in particular will find the new pay station a great convenience, for they will be enabled to obtain information as to their whereabouts, for Captain Judson has a broad sweep of the Sound from his home and can sight a vessel a long distance off either up or down the Sound.

A telephone line is in course of construction from Goochland, C. H., Va., via Maidens, to Shelton's Mills, in Louisa County, which, when completed, will give direct communication with Richmond by the Louisa line, and also over all the lines of the Louisa line and its connections. Charles and Robert Montiero are constructing the line.

The Bell Telephone Company, through Mr. West of Atlanta, Ga., has purchased the Elberton Telephone Exchange in that State for \$6,000, and will at once connect Elberton by long-distance phones with Atlanta and other cities.

The Delmarvia Telephone Company is making good headway with its line from Wilmington to Newark, Del.

The Nebraska Telephone Company is extending its line from Elmwood direct to Lincoln, making a short cut.

Independent Companies of Illinois Agree on Ten Years' Contract.

Independent telephone companies in Coles, McLean, Champaign, DeWitt, Logan, Macon, Moultrie, Shelby, Christian and Effingham Counties have entered into an agreement to exchange services over toll lines from June 1, 1901, to June 1, 1911. This agreement will prevent any of the companies from being absorbed during its life. Arrangements have been made to construct direct toll lines connecting Champaign, Bloomington, Lincoln, Farmer City, Leclatur, Sullivan, Mattoon and Taylorville, doing away with local toll lines connecting with the circuit from Mattoon to Terre Haute, which contributes to the long-distance line to Ohio, and connects at Effingham with the Kinloch system of St. Louis.

Telephones Here and Abroad

The independent companies furnish the only competition to the giant telephone concerns of the United States, while in Europe, wherever the telephone system is not under State or municipal control, municipal systems furnish the competition, which tends to cheapen the service. In Stockholm the service is supplied by the State, and the charge is \$14 a year. There is a telephone in that city for every twelve persons.

In Glasgow the Municipal Company is charging \$36 a year and the National \$50. The business of the Municipal Company is growing tremendously, and it is expected that public ownership of the telephone will soon be insisted upon by the British public.

The telephone system in Switzerland is under State control, and in the city of Zurich, which has a population of 150,000, there is one instrument for every thirty-five persons. There the charge is \$30 for the first year, \$14 for the second, and \$8 for the next and for each succeeding year, with an additional charge of a cent for each conversation.

According to a Bay City, Mich., paper, the Valley Telephone Company has purchased the Thumb telephone system, owned by F. W. Hubbard & Co., of Bad Axe and Port Austin. To connect this system with the Valley a line will be built from near Bay City to Sebawaing, at a cost of about \$25,000. The line will be metallic circuit. August 29 the contract with the Moore system in Tuscola County expires and the company will commence the construction of a system in that county. The company will at once begin the construction of another line to Bay City on the east side of the river. This will be the only line on the east side, all the others being on the west side.

There is talk of organizing a home telephone company at Logansport, Ind., to compete with the Central Union, which has announced a graded schedule of rates, at a substantial increase. The Central Union has solicitors at work seeking subscribers to the party line and "kitchen" service. Patrons say they will not pay the increased prices, but will order their telephones taken out. It is said that the New Telephone Company of Indianapolis was asked to come to the relief of Logansport, but it regarded the prevailing rates as too low.

The Central New York Telephone & Telegraph Company has established exchanges at Adams, Antwerp, Cape Vincent, Madrid and Theresa and is building exchanges at Clayton and Alexandria Bay, which are about completed. The construction of a new copper metallic circuit to Clayton and Frontenac Hotel, Round Island, is under way, as is also a metallic connection to Point Salubrious.

The farmers of Illinois have the telephone mania. Illinois husbandmen, it is asserted, believe in the telephone, because they can talk to their Chicago milk, butter, cheese and cream dealers over the wire every evening if they wish.

Letters patent have been issued for the incorporation of the Peninsular Telephone Company at Tampa, Fla., with a capital of \$300,000, to construct and operate a telephone system in Tampa and forty-one other towns in Florida, and to establish and maintain ten long-distance telephone systems. W. G. Brarlen, James J. Langford, James W. Barwick, Jacob F. Brarlen and Guy Huffman are named as incorporators.

Whitesburg, Ky., citizens have agreed to subscribe generously for the building of a telephone line from Stonega, Va., 16 miles distance. Work will be commenced at once and pushed to completion.

A report from Charlestown, Ind., states that the telephone service has been seriously impaired by the severe storms.

The Murdock, Minn., council has granted the Murdock-Carlson Telephone Company the privilege of erecting poles.

Modern Telephone System for New Brunswick.

P. Mooney was recently awarded the contract for building the New Brunswick Telephone Company's new exchange at St. John. It is a big work, the estimated cost being \$100,000. It is expected it will be ready for use early next year. The most modern telephone system will be installed.

After much work by the workmen of the New England Telephone & Telegraph Company on the private telephone line of division 3 of the Worcester, Mass., Consolidated Street Railway, the line is in working order, and there is a good circuit between Clinton and Leominster. The line between Clinton and Worcester, which was in use on the old Worcester & Clinton line, is still doing business, but there is a change coming, for the little red call boxes which are put in with the new line are placed in position along the line, and all there is to do is to connect them to the wires which were in use on the old circuit.

The United Telephone & Telegraph Company, incorporated by A. T. Averill, W. H. Dunn and G. M. Averill of Cedar Rapids, Ia., and Charles Webster and G. W. Patler of Waucoma, Ia., has filed its articles in Hennepin County, Minn. The capital stock is \$100,000. It is understood the new company will take over the property and franchise of the Greene & Western Company, and co-operate with the Twin City Telephone Company. The Greene & Western lines run from St. Paul to Mankato and from Minneapolis to Waterville.

The Inter State Telephone Company, the purchaser of the Home Telephone Company of Trenton, N. J., is now considering the improvements needed to put the local plant in first-class condition. The following is the new board of directors in charge of the local plant: C. W. Kline, of Hazleton, Pa.; Congressman H. C. Lonsdale, of Camden, N. J.; A. M. Worstell, of Philadelphia; Hugh H. Hamill, Barker Gummere, Jr., R. P. Wilson, L. B. Risdon, George McPherson and Albert Clayton.

At a recent meeting of the board of directors of the Syracuse, N. Y., Telephone Company, it was decided to extend the company's long distance lines to Oswego, a new line to be constructed along the shore of the lake from Lakeside Park to Long Branch and Liverpool to connect with the line running to Baldwinsville and Fulton. A new line will be strung from Fulton to Oswego.

A recent report from London, Ont., states that the Bell Telephone Company is working on the installation there of the central energy system. The work may be completed this year, and will be a great convenience to patrons. There will be no bell ringing. All the batteries will be at the central station.

The formation of a telephone company, with a capital stock of several million dollars, is about perfected in West Virginia. The Fairmont & Mannington Telephone Company's lines have been gone over by inspectors employed by the combination, and also other local lines throughout the State have likewise been inspected.

The Nebraska Telephone Company is spending \$5,000 in improving its local plant at West Point. Wires are being strung in metal tubes instead of singly, a new and improved switchboard is being put in and other improvements are under way.

Telephone Companies Increase Stock.

The Citizens' Telephone Company, Washington C. H., O., from \$50,000 to \$100,000. The Ft. Dodge Telephone Company, Ft. Dodge, Ia., from \$25,000 to \$50,000.

TELEPHONE INCORPORATIONS.

The Gibson Telephone Company, Gibson City, Ill. Capital stock, \$12,000. Incorporators, G. F. Schlosser, A. L. Phillips and H. A. Ball.

The Richfield Springs Telephone Company, Richfield Springs, N. Y. Capital stock, \$5,000. Directors: M. A. McKee, John Gyer and F. E. Munger, all of Richfield Springs.

The Farmers' Mutual Progressive Telephone Exchange, Houston, Ill. Capital stock, \$190. Incorporators: A. M. Redpath, Thomas Brown and W. R. Preston.

The International Wireless Telephone & Telegraph Company, Phoenix, Ariz. Capital stock, \$25,000,000. The papers are from Philadelphia and are signed by W. Gehring, H. W. Shoemaker, R. Leander, W. J. Moss and Henry W. Dash.

GENERAL ELECTRICAL NEWS.

Lighting.

Arcadia, Fla.—J. J. Heard, C. C. Chollar and J. L. Jones have incorporated the Arcadia Electric Light, Ice & Telephone Company with \$20,000 capital stock for the construction of an electric light plant, etc.

Asheville, N. C.—The Asheville Electric Company has asked for a lighting franchise for Asheville and Weaverville.

Beaumont, Tex.—The Beaumont Street Railway Company has purchased a site for the power house and electric light plant, and will soon begin the work of construction.

Burlington, Ia.—The mayor has signed the resolution calling for bids for public lighting which are to be received by August 1.

East Greenville, Pa.—The citizens of this place are agitating the question of erecting an electric light plant.

East Palestine, O.—East Palestine is figuring on enlarging its electric lighting system.

Evansville, Wis.—The citizens are agitating the question of erecting a municipal electric light plant.

Lisbon, N. D.—The citizens are agitating the question of erecting an electric light plant.

Little Falls, N. Y.—Last week fire destroyed the electric plant of I. N. Lovenheim.

Minot, N. D.—L. M. Davis contemplates the erection of an electric light plant in this place.

New Martinsville, W. Va.—The Ohio Valley Development Company, of which H. Thomson is president, was recently incorporated and will apply for a franchise for the erection of an electric light plant.

North Branch, Mich.—An electric light plant will soon be established in this village.

Norway, Mich.—The citizens have voted to issue \$25,000 in bonds to build an electric light plant.

Oneida, Ill.—W. D. Patty, H. W. Crane, S. J. Metcalf, and F. Stephen have been granted a franchise to build an electric light plant in this place.

Parsons, Kan.—The Parsons electric light plant was almost destroyed by a recent fire. The loss is about \$1,000.

Pedricktown, N. J.—This place is to be lighted by electricity.

Port Leyden, N. Y.—This place may have electric lights in the near future.

Salem, Ore.—The Salem Light, Power & Traction Company has been incorporated for \$130,000 by W. A. MacRae, D. H. Page and R. Mallory. The company will build and operate an electric light plant and street railway in this city.

Soda Springs, Idaho.—D. Swinehart of Pocatello has a proposition for putting in an electric light plant here.

South Seattle, Wash.—It is proposed to install a system of electric lighting in this place.

Stewartville, Minn.—The citizens of this place are agitating the question of erecting an electric light plant.

Sulphur Springs, Tex.—The electric light plant was recently damaged by lightning.

Texarkana, Tex.—The Kansas City, Mo., concern, headed by R. M. Shaw, has been granted a franchise for the erection of an electric light plant here.

Thompson, Mont.—A proposition is on foot to give this town an electric light plant. J. Pruden of Missoula is interested.

Warsaw, Ill.—E. H. Hillman, owner of the electric light plant here, contemplates the erection of a new plant in the fall.

Washington, Ia.—The citizens of this place will soon vote on the question of erecting a municipal electric light plant.

Waukegan, Ill.—Chicago men, represented by W. S. Lester, are negotiating for the purchase of the electric light plant.

Waverly, Tenn.—A. E. Justice and J. P. Cowan have incorporated a company for the establishment of an electric light plant. Address A. E. Justice.

Woodstock, Va.—The Woodstock Electric Light Company has been organized with Charles S. York, of Baltimore, president.

Street Railways.

Canastota, N. Y.—The Canastota & Morrisville Railway Company has been organized with \$300,000 capital stock to operate a street surface electric road from here to Morrisville.

Celina, O.—Celina is soon to have an electric railway. Messrs. Carpenter and Callister, of the Western Ohio Railway Company, have met the council and secured a franchise to construct and operate an electric line in this city. They promise the cars will be in operation by November 1.

Chihuahua, Mex.—Governor Ahumada has granted an extension of one year to General Mills and associates in which to convert the street car lines in Juarez to an electric system.

Cincinnati, O.—The board of public service has approved the ordinance authorizing the Cincinnati & Northwestern Railway Company to change its motive power from steam to electricity.

Clyde, O.—The council has granted a franchise to the Sandusky, Clyde & Tiffin electric railway projectors.

Columbus, O.—A company was incorporated lately to build another interurban railroad into this city. The name taken by the organization is the Ohio Central Railway Company of Columbus, though because of the similarity of that name to the name of a well known Ohio steam road, it may be necessary in the opinion of the Secretary of State to take another name. The company proposes to build and operate an electric railway from Columbus to Bridgeport, Belmont County. Senator W. E. Finck is one of the promoters.

Dixon, Ill.—The Northern Illinois Electric Railway Company has been organized in this city with headquarters at Steward. The organizers are Titus Brothers of Steward, and S. D. Frost of Amboy. The right of way has been secured from Steward to Amboy, and from Lee Center to within a mile of Dixon.

Doylestown, Pa.—A new trolley company has been formed with Recorder B. Michener as president and W. C. Ryan and C. S. Baldeston as secretary and treasurer to construct a road from here to New Hope by way of Mechanicsville and the Cuttlossa Valley.

Galesburg, Ill.—A franchise has been granted the People's Traction Company to build an electric road from this city to Abingdon, a distance of 12 miles.

Georgetown, Ky.—The fiscal court has granted to G. Alexander, A. S. Rice, W. Adams and others a franchise to construct and operate an electric railway between here and Lexington.

Hazleton, Pa.—Surveys for a trolley line, which is to connect this city with Wilkes-Barre, have been completed, and the contract for the construction of the road, which will be 26 miles long, will be given out shortly. A tunnel 2,700 feet long, will be run through the Wilkes-Barre Mountain. Alvin Markle is one of the capitalists interested in the enterprise.

Milwaukee, Wis.—Manager J. I. Beggs of the Milwaukee Electric Railway & Light Company states that an electric line to Hale's Corners will be constructed at an early date.

Monaca, Pa.—The borough council of this place has granted right of way over certain streets to the Corapolis and Monaca Electric Street Car Company. When this line is completed, Beaver Valley will have street car connection with Pittsburg.

Nashville, Tenn.—The People's Street Railway Company has asked for a franchise to build an electric line on certain streets of this city and suburbs.

Newton, N. H.—The selectmen gave a hearing a short time ago on the application of the Haverhill, Plaistow & Newton Street Railway for a location of its tracks in this town. The location was granted subject to such conditions as the selectmen think the interest of the town demands. This will be the first trolley line to run through this town.

Oil City, Pa.—Local capitalists composing the Citizens' Traction Company have completed arrangements to build a trolley line from here to Franklin, a distance of eight miles along the Deep Hollow.

Port Clinton, O.—The Lake Erie, Bowling Green & Napoleon Railway Company was lately incorporated

with \$300,000 capital stock. It will build an electric railway from here to Defiance.

Reading, Pa.—The Reading Electric Railway Company has filed articles of incorporation with an authorized capital of \$50,000.

Spokane, Wash.—The Northwestern Mammoth Granite & Electric Power Company has been incorporated for \$100,000 for the purpose of building an electric line from this city to Little Spokane. J. R. Price is interested.

Troy, N. Y.—James F. Brearton is obtaining consents for the electric railway which it is proposed to build along the river front in this city from Adams street to the State dam. This railway will be for carrying freight.

Watertown, N. Y.—The International Electric Light & Power Company of Jefferson County has voted to increase its capital stock to \$250,000, and it is understood will build a trolley line from Redwood on the Rome, Watertown & Ogdensburg Railroad to Alexandria Bay on the St. Lawrence River, a distance of eight miles.

Manufacturing.

Des Moines, Ia.—Dodd & Struthers, manufacturers of X-ray machines and electrical apparatus of various kinds, have bought a 66-foot lot, and will erect a brick factory at once.

Glen Ridge, N. J.—A deed has been filed at Newark, N. J., for the sale of the Hayden estate on Bloomfield avenue in this place to Thomas A. Edison. The land is part of a plot on which is to be erected the factory for the manufacture of Edison's recently invented storage battery.

Company Matters.

Morton, Pa.—A new firm known as the Worrell Electrical Company has opened offices here. The members of the firm are D. V. Worrell, W. C. Timm, Jr., and L. P. Edwards.

Waterloo, Ia.—The Waterloo Gas & Electric Company has increased its capital stock from \$180,000 to \$220,000.

Power and Transmission.

Allegan, Mich.—W. H. Patterson of Grand Rapids will erect a dam across the Kalamazoo River at this place, and build a large electric power plant to be used by the Grand Rapids, Allegan & Kalamazoo Street Railway.

Dover, Del.—The United Railway, Light & Power Company, with a capitalization of \$5,000,000, was incorporated here lately. The company is authorized to purchase and acquire land and buildings for operating railways and heat, light and power plants.

Mines.

Park Valley, Utah.—The mines and mills of this place are to be provided with electrical energy. The Golden Electrical Power & Transmission Company has been organized with a capital of \$50,000 by business men of Salt Lake City, with a view to supplying the power and light used in the camp. The company will harness the waters of George Creek at a point about four miles from Park Valley, and expects to be able to turn on the electric current within the next six months. Contracts for furnishing power have already been made with the Century, the Planetary, El Amigo, West Century and Golconda Mining Companies.

Automobiles.

Birmingham, Ala.—The Birmingham Electric & Manufacturing Company, a corporation recently organized by J. M. Lansden and William M. Little for the manufacture of electric elevators and automobiles, has bought a lot and expects to begin building at an early date.

Winston, N. C.—An automobile or street car line will probably be established between Winston-Salem and Greensboro.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 16½@17c.; Lake, 17@17½c.; casting, 16½@16¾c.

Eight wireless telegraph companies, with \$5,000,000 capital, have been incorporated at Pierre, S. D.

Little credence is attached to rumors of a strike on the part of Philadelphia Union Traction employees.

The Edison Electric Illuminating Company of Savannah, Ga., has declared the regular semi-annual dividend of 3 per cent., payable July 1 to stock of record June 30.

According to directors of both companies, the prospect is that there will be no consolidation of the Electric Company of America and the American Railways Company.

Stockholders of the Chicago Union Traction Company will hold their annual meeting July 23, at which several changes in the personnel of the management are expected to be made.

The return this week of P. A. B. Widener and William L. Elkins is expected to be followed almost immediately by the completion of the Philadelphia Company, Consolidated Traction of Pittsburg deal.

The following are quotations for some of the industrial stocks not quoted elsewhere: Electrical Lead Reduction, 3@3½; Electric Boat, 19@20; Electric Vehicle, 9@10; Tel. & Tel. Company of America (full paid), 4@6½; Electric Company of America, 7@7½; National Carbon, 16@18.

Judge Thomas of Cleveland, O., has accepted the presidency of the Telephone, Telegraph & Cable Company of America. The Consolidated Telephone & Telegraph Company, with \$12,000,000 capital stock, will be incorporated in Delaware to father a number of independent companies between Boston and Chicago.

A dispatch from Port Jervis, N. Y., says that New York capitalists, represented by R. H. Beach, vice-president of the General Electric Company, and Charles K. Horn, of this city, have bought the stock of the Port Jervis Street Railway Company and the Port Jervis Light & Power Company with a view of extending the road. The Port Jervis Company is also said to be included in the deal, and that negotiations are in progress for the purchase of the Deer Park Electric Light Company.

Vice-Chancellor Pitney in Jersey City on Monday denied an application to restrain the New York Electric Vehicle Transportation Company from collecting a second installment of 10 per cent. upon its stock, which had been ordered by the Board of Directors on May 7. The ground upon which the application was sought was that the money was not needed and that the purpose for which it was demanded was to promote the private interests of certain stockholders who were interested in another corporation.

The Boston committee on stock list recommends that \$15,000,000 from 4 per cent. collateral trust coupon bonds of 1929 be admitted to the Stock Exchange list. The committee further recommends that it have power to list \$94,237,500 capital stock upon completion of arrangements for transfer of said stock in New York; and further, that it may add to the list from time to time \$20,709,000 additional of said stock on official notification that the same has been paid for, issued and delivered.

Monday was dividend day in Wall Street and the semi-annual disbursements due July 1 were paid by perspiring tellers to long lines of messenger boys who were to be seen at all the leading downtown banks and trust companies. Coupons came in bags, by the hundred and in ones and twos, but each had to be counted and carefully destroyed after the payments had been made. No accurate estimate could be made as to the amount which was paid out, but several banks and trust company officials state that at least \$75,000,000 was paid out or changed from one account to another.

The lease of the Brooklyn Union Elevated to the Brooklyn Heights Railroad Company has been filed at Albany with the Secretary of State to expire June 30, 1900. The lessee covenants to pay annually in quarterly installments all reasonable expenses of maintaining the corporate existence of the lessor company not exceeding \$3,000 a year, and the lessee further agrees as part of rental to pay to lessor company before each September 30, after June 30, 1902, until, including September 30, 1900, all of the annual earnings received by lease from the operation of the Brooklyn Union.

This week there will be a home coming of a number of powerful men in the world of finance, and the rank and file are looking for a fresh outburst of speculation. J. P. Morgan is expected to reach New York City on Thursday next, and on the same boat on which he arrives will be a number of other gentlemen who have been prominent in Stock Exchange affairs. Many others who have been away are also expected to be in the city this week, and the several meetings to be held will bring together an aggregation of capitalists seldom before assembled in New York City at one time.

The Boston "News Bureau" says: The buying of the Massachusetts Electric securities is characterized as of the best and by people who are looking to the future of the property rather than the present. No common stock dividends, however, should be expected this year. Under the laws of Massachusetts a street railway company cannot pay its stockholders more than 8 per cent. in dividends without dividing such surplus dividends equally with the State. The Massachusetts Electric Companies is the sole owner of the stocks of its two constituent operating properties—the Lynn and Boston and Old Colony street railways, and dividends of 8 per cent. on the stocks of both of these latter companies will be sufficient to show only 2 per cent. for Massachusetts Electric common after the payment of interest on debenture notes and 4 per cent. on the preferred stock.
